6442. Would you agree with me in thinking that the country is now ripe for a rather more elaborate national organisation? I notice in the summary of what you propose to say you suggest with regard to experimental work that "all local experiments should be organised in consultation with the local authorities and correlated by a special staff of the Board of Agriculture." Do you think the existing department of the Board of Agriculture might be extended and organised with perhaps a consultative committee to control, or rather, supervise, the whole of the system of national agricultural education by a central committee?—Yes, I think so. I think, if I may say so, I should rather like to see the Board of Agriculture take up the boys at an earlier age. I think the tendency is to teach them other things rather than agriculture, and if the Board of Agriculture could take them in hand before they leave the elementary schools, and see that they are educated with a bias towards agriculture, it would be a step in the right direction.

6443. I wonder if it is your opinion—it certainly is mine—that the best unit for this purpose would be the administrative county, or, in the case of small counties, a group of counties?—I think, as a rule, the county.

6444. You agree with me, then, that it would be very desirable that each unit should be brought more into touch with, and be subject to, a central body so as to prevent overlapping?—Into touch with, certainly; but I am not quite sure about "subject to." I should like to see each county have their own head to a certain extent, but what they do, I think, should be sifted by the central authority to see whether their results are correct and reliable.

6445. You have not at present in your county an agricultural school?—No.

6446. It would be a costly thing to establish one, I suppose?—We have not started one. I do not think there has been sufficient demand to justify our doing so.

6447. In order that your intelligent boys who are going to take to farming might get the advantage of such a school they would have to go to some other county?—Yes.

6448. You would probably give them scholarships?—Yes, we should. There are certain county grammar schools now which have endowments which are practically being taken care of by the Board of Education, and I should like to see those schools which are purely in country places devoted to agricultural education suitable for farmers' sons who are going to be farmers.

6449. You are well off in the county for schools with endowments?—There are two or three schools with endowments, and I think they should be made good agricultural schools for farmers' sons.

6450. Do farmers' sons attend these schools?—Yes.

6451. We were told that it is very desirable for a boy who is going to be a farmer, presumably a farmer's son, that he should have a sound education at a grammar school first, that he should then go for a year or two to the farm, and then have some specified training afterwards?—I think, if his general education could be kept going alongside of his agricultural education, it would be better. I think he should be kept fond of the land.

6452. Have any of the secondary schools in your county got agricultural sides?—Our county has started several secondary schools, but they are all in the towns, and with regard to secondary education, we agriculturists are being left out in the cold. I should like to see these endowed schools purely agricultural schools.

6453. Similar to the Dauntsey School?—I have not seen that school, but I gather from what I have heard of it that that is the class of school I should like to see.

6454. There must be a considerable number of tradesmen's and professional men's sons. Where are they to get the education?—In the centres of education our county are establishing secondary schools to which they will go.

6455. (*By Mr. Lamont.*) You were for many years Chairman of the Agricultural Sub-Committee of the County Council?—Yes. I gave it up about six months ago.

6456. During that period did you find the County Council pretty considerably alive to the importance of agricultural education?—I can only say this, that I have never asked them to do anything which they have refused. They have always granted me any sum I have asked for for agricultural purposes.

6457. You have not had any particular difficulty in obtaining money for the purposes of agriculture?—No, our County Council have always met me most fairly.

6458. I take it from that that on your County Council you have a good many agriculturists—landlords or agriculturists?—A fair number, but I think agriculturists are in a minority. The other people are reasonable, however, and if a demand is made, and they consider it reasonable, they accede to it.

6459. You have a large number of small fruit farm holders, have you not?—Yes, we are one of the counties that have established small holdings under the County Council, and I think a good many of the landlords, as they get an opportunity, are creating small holdings on their estates, but of course that cannot be done in a day.

6460. Do you find those small farmers are any more alive to the need of agricultural education than the larger farmers?—No, I cannot say that I have found that.

6461. You do not think they would send their sons if there were agricultural secondary schools such as you have described, or perhaps even go themselves for winter courses?—They might, but I think it is very doubtful. I think it is the sons of the larger and moderate-sized farmers who would take advantage of such schools. Some of the more intelligent smaller farmers might send their sons, but I think it would be rather the exception than the rule.

6462. You do not think that the mere fact of there being more men, *ex hypothesi*, with small holdings in a given district, with perhaps the interchange of ideas becoming more general, would lead such subjects to be more discussed among them, and therefore make them more alive

to the need of progress in this direction?—It might in time, but I do not think at the present time there is much demand from the small holder for education, unless he is pushed to it.

6463. You think perhaps there ought to be some incentive?—Yes, I do not think in the natural course of events he would send his son anywhere else beyond the elementary school as a rule, but of course there are exceptions.

6464. I rather agreed with what you were saying as to the conversion of a considerable portion of the endowed grammar schools into purely agricultural secondary schools. You would agree, I take it, that those secondary schools, when established, should in every case be affiliated to the collegiate centre of the district?—Yes, they should lead up to that.

6465. In your case, I suppose it would ultimately be to Birmingham?—It is a question for the future, whether we should affiliate ourselves to Birmingham or start one of our own, but at the present time I think it would probably lead up to Birmingham.

6466. (*By Professor Middle'on.*) With regard to local experiments, you say: "All local experiments should be organised, in consultation with the local authorities and correlated by a special staff of the Board of Agriculture." Do you mean that the results should be correlated, or that the plans for the experiments should be?—The one would follow the other. "Local authorities" is perhaps a little bit misleading—I do not mean to confine it to the County Councils.

6467. You mean someone acting in the county for the local authority?—Yes, or where there is a college where they carry on experiments.

6468. In your particular case—I am speaking of Worcestershire—how would you propose to co-operate with any special staff of the Board of Agriculture? Have you any special member of the staff or lecturer?—We have been carrying out experiments in the winter in the spraying of fruit trees and so on, and this, I think, should come before the Board of Agriculture, who could judge of the benefit of it, and who should be able to check the results, and, if necessary, have the experiments repeated next year and see whether they are correct.

6469. You have done that work with the help of a special agent whom you engaged?—Yes, with this particular money which was left for agricultural education; it is not given out of the County fund.

6470. Is there any other type of agricultural experiment that you have been carrying on apart from that which is conducted by the Union of Clubs?—No, not apart from that. Some years ago we carried out several manure experiments, but they were more object-lessons for the ordinary farmers than anything else, and they did not come to much.

6471. Who organised that?—The County Council.

6472. Can you give us any idea as to how many have adopted the apprenticeship system that you mentioned in any particular year?—Perhaps we get 20 or 30 in a year—some of them for sheep-shearing, although that has rather died out now, and pruning and grafting and hop drying.

6473. Have you encouraged young labourers to attend classes?—There are a few classes, but they are not very popular. I am afraid it will take a great deal of encouragement to make them go. It is a great pity, but some of the boys who come from the elementary schools cannot even sign their own names; I have frequently come across that.

6474. (*By Lord Barnard.*) Are you one of the Board's Agricultural Correspondents?—I am.

6475. Do you consider the system is of very much value?—I think I have had only one application from a man who thought he was ill-used by railway rates.

6476. (*By Lord More'on.*) Are there any others in your county besides yourself?—I am not quite sure.

6477. You do not know who they are?—No.

6478. You yourself, one of the correspondents, are unable to say who the others are?—Yes.

6479. Do you think the services of the Board of Agriculture Correspondents could be made of use in connection with agricultural education—perhaps you have not thought of that subject?—I do not think I have. The difficulty I have is to find time for all these things.

Mr. E. V. V.
Wheeler.

5 June, 1907.

LIBRARY

FOURTEENTH DAY.

Thursday, 6th June, 1907.

PRESENT :

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

Lord MORETON.

Mr. DAVID DAVIES, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. P. P. PENNANT, M.A., called and examined.

Mr. P. P. Pennant. 6480. (*By the Chairman.*) You are a member of the Council of the University College of North Wales at Bangor?—I am.

6 June, 1907. 6481. The first instruction at that College was given at Anglesey?—It was.

6482a 6482. Perhaps you will give the Committee the history of the origin of the first instruction in agriculture by the College?—Some of the Anglesey land owners and farmers, I should say principally farmers, thought that they would like, if possible, to derive benefit from the North Wales College which they had done a great deal in founding, only the agriculturists found that it did not do them very much good from their point of view, and they got hold of Professor Dobbie, who was, at that time, professor of chemistry in Bangor, and got him to deliver lectures and carry out experiments on soils and manures. That was in the year 1885, and that really was the beginning of agricultural work in connection with the University College. That was continued in the following year, and I think it was in the following year or the year after that there was something done in Montgomeryshire of the same character. About the same time or rather later—it began in 1887, so that would be two years later—instruction in dairy work began to be talked about in Flintshire and Denbighshire. It so happened that the daughters of one or two farmers in the district had been to the Worleston dairy school in Cheshire, and when they came home their fathers were a good deal struck with the improvement that had taken place in their knowledge and practice of dairying, and there was a good deal of talk about it. I knew some of these farmers, and it was said why should not we start a dairy school of our own, and I brought the matter before the Flintshire and Denbighshire Agricultural Society, which is a society for the purpose of holding an annual show. I brought it before their executive committee, and we talked the matter over. Then I proposed to them that we should have meetings in certain centres, Denbigh, Mold and Wrexham, and invite Dr. Dobbie over to assist us in carrying out our plan. Then the farmers seemed anxious that a dairy school should be started, and eventually we agreed to form a limited company which should carry on this dairy school, and Mr. Ralli gave us a grant of £300 which was a great help towards the matter, and we started a limited company, and so the dairy school at Llewenni was established. That is running still, and it has done a very great deal of good work in fact. At first, when we opened it, we merely gave instruction at the school, but after two or three years we thought we would advertise ourselves by giving demonstrations in different centres in the country, and we took a travelling dairy round, and we had this travelling dairy for a week at each place at four different places. We took pupils there. First of all we began the week with demonstrations. Then later on we allowed a certain number to receive instruction, and then had a competition at the end, and then at the end of the week after the competition we gave what may be called scholarships to the dairy school for those who took prizes at these places. They were very successful, for I think there were 605 that paid fees and were pupils at this travelling dairy.

6483. In what year was that?—In 1892 that would be.

6484. 605 in one year?—Yes, in one year; that was at these travelling dairies. Then the dairy school itself opened on the 1st of May and was carried on till the 1st of September. We carried it on under the general superintendence of the newly formed agricultural department of the University College.

6485. When was that department formed?—I ought to go back a little bit; in fact, I intended to go back. A general sign of anxiety that something should be done for agriculture by the University College was shown in Anglesey as I said, and then in Montgomeryshire also, and by the dairy work that was being carried out in Flintshire and Denbighshire. In 1889 a grant was made by Parliament to the Privy Council of £5,000 for the purpose of promoting agricultural education, and the North Wales College had a grant of £200 from them. As soon as they received that £200 they at once proceeded to raise subscriptions to supplement that £200, and to form a definite agricultural department for the College.

6486. That was, I think, the first agricultural department which was started in England at a university college?—It was, and that was started at the beginning of the following year, that would be 1890; it arranged for work both in the college and out of the college. I will not say anything about the in-college work because Prof. Winter is here, and he of course can speak very much better as to that, but the out-college work consisted of looking after and assisting those dairy schools such as the one I have related the foundation of, and also extension lectures outside and field experiments. That was the principal part of the out-college work. As I said before, this department was founded in 1890. The Bill for the County Councils I think was 1889. They had just come into existence, and in 1891, that is to say when the department was just one year old, we had a conference at Bangor between members of the college and representatives from the county councils of North Wales. There was another point that I ought to mention. Just before the conference the county councils had received a grant of what I think is commonly called the "whisky money" for the promotion of technical and higher education. In Flintshire we had had the matter before the County Council and the new Welsh Intermediate Act had just been passed, and we agreed in Flintshire that we would devote three-quarters of our "whisky money" to the new secondary schools which were about to be founded and that of the remainder a certain portion should be devoted to agriculture. At Bangor, at this conference, I related what had happened and what had been decided on in Flintshire, and the conference unanimously passed a resolution recommending the other counties to follow the Flintshire example and devote a portion of the "whisky money" to agriculture under the direction of the University College, and thereupon grants were made by the county councils to the agricultural department at Bangor, and the county councils thereupon took over the dairy school at Llewenni which has since that date been not under the limited company which was formed originally, but under the direction of Bangor, with a grant from Flintshire and Denbighshire to carry it on.

6487. It ceased to be a limited liability company?—Yes, we handed it over; they bought our plant; the

*Mr. P. P.
Pennant.*

6 June, 1907.

6487a plant belongs to the county councils and they are responsible for carrying it on all the time under the Agricultural Department at Bangor. The result of that conference that I spoke of was to put the Agricultural Department into the position it is now, which is receiving grants from several county councils and the work being carried out at the college by the college authorities, and in the several counties by committees, half the members of which are appointed by the college and half by the county interested. That is the way in which the work of the department is administered outside.

6488. Their grants for agriculture are given by the various counties to the agricultural department of the college which administers those grants?—Yes.

6489. Through those committees?—And they administer it through the committees.

6490. That dairy school at Lleweni is a dairy school under the control and supervision of the Agricultural Department of the College?—It is, but it is actually administered by the committees of Flintshire and Denbighshire. I mean the actual administration is carried out by the committees of Flintshire and Denbighshire; those committees being formed in this way, half the members are appointed by the county councils and half by the University College.

6491. The committee receive the grants that are made to the college for agricultural education?—They do.

6492. Therefore one may say that the agricultural committee controls the agricultural education in the county?—It does.

6493. You have some personal experience of the outside work of the college?—Yes, I have attended several of the courses of extension lectures and so I know the persons who come to hear the lectures and the character of the lectures and also of the interest that is taken in them. I find that the best farmers in the district come and take considerable interest in the lectures and after the lecture they ask questions and thoroughly cross-examine the lecturer on points connected with the subject in hand and I mix with the farmers a good deal and I know that they are extremely pleased with these lectures and more particularly when they bear on something of which field experiments in the neighbourhood have been a sort of illustration. If I might venture to say so, I think that perhaps the two most successful lectures that I have heard were on basic slag experiments on grass land, when the lecture was delivered on the spot, and the blackboard was the grass field in front. There was one of those on my own land, and that drew a good number; and in another case we took a field for the experiment, which was at the junction of four railways. There was a station adjoining it, and there were crowds came to that, and it was a most satisfactory and most successful experiment, and it was particularly so because it was a field that had been thoroughly neglected for years, and therefore you were able to see the result. There was no previous manuring that interfered with the experiments in any kind of way.

6494. Do the lecturers belong to the staff of the college?—They do; they belong to the staff of the college, and they are sent round. There is just one observation that I should like to make about that. Our lecturers leave us too often. The reason of that is, I think, that the North Wales college has rather a good reputation, so that a lecturer who comes from our college is rather in demand—perhaps, as they say, I say it as should not, —but they do get tempted away, and there is no doubt about it that we are not able to keep them on the spot, and I regret to say that we are too often asked to give testimonials for our own officials to go off to such places as Newcastle or Leeds, or some of those other colleges.

6495. The salaries are inadequate, and do not induce them to remain with you?—Yes, the salaries are too inadequate to induce them to remain; that is the real fact. Now, with regard to the dairy work, I should like to mention this, because it speaks for itself. I think in 1893 the Royal Agricultural Society came to Chester, and of course coming to a dairying part of the country there were a good many competitions and prizes given, and so forth; and in the dairying competitions, taking all the names of the persons, prize takers or commended, just over one-half came from the Lleweni school. We thought that was a great feather in our caps, because there was the Worleston school in Cheshire, which was

older than ours. However, just over the half had been through our school, so that I think it showed that we were doing a certain amount of good work.

6496. You have also a forestry department?—Yes, we have. I have not had much to do with the forestry department, and so I think I will leave that for Professor Winter to speak about. I have been more concerned with the agricultural department.

6497. Do the farmers consult the agricultural department?—Oh dear, yes. They do, and numbers of them come to visit the agricultural farm. At first we had no farm, but after a short time we found that a farm was a necessity, and a great number of persons visit there. Of course, a farm of that sort is to a certain extent an experimental one. The stock experiments are viewed to a certain extent.

6498. How large is the farm?—I think the farm is 600 acres, but half of it is sheep walk; it is not far from Bangor. It slopes down to the sea; a good bit of mountain land comes in; it is about half, I think.

6499. Do you grow any fruit trees on the farm?—I do not think there has been anything of that sort done—however, Professor Winter lives there, and he can tell you better about that.

6500. Are the students resident at the college?—Yes, there are students permanently there taking the regular course, who attend the agriculture, and then there are short course students who attend there just for a short time, taking the agricultural part of it only.

6501. Does the college provide accommodation for the students?—No, they live in lodgings entirely.

6502. Are any of them living on the farm?—No.

6503. Do they work on the farm?—Yes, certainly they assist in the daily operations. The King is to lay the foundation stone of the new buildings of the college on the 9th of next month; we are in temporary buildings altogether at present.

6504. Is there a horticultural department?—No, there is not; our means are very limited, and I think it is a wonder that we have done as much as we have.

6505. Are the students at the dairy schools mostly women?—Almost entirely women, not absolutely.

6506. You say that the interest the farmers take in agricultural education is very marked?—Very marked indeed, and has been very growing. At first I should say that the bulk of the farmers—but that is almost a generation ago—would say that a man of books could not teach them much at all; they had that sort of feeling, but now it is quite different; they enter with the greatest interest into the experiments and the lectures, and they greedily run after the leaflets explaining them.

6507. You disseminate leaflets and reports of experiments?—We do. The experiments are all explained in leaflets. We find that that is the best way—just to have them in leaflets and not in a big book bound up containing them all. Each separate experiment is put on to a leaflet—each field experiment we will say—so that it is not too long to read, and those who want one subject are able to get it without being bothered with what they do not want.

6508. The experiment is repeated in subsequent years?—Yes.

6509. The experiment is not limited to one year?—No, certainly not.

6510. Do you do anything in the way of horse shoeing?—I do not know what they may teach exactly; they may or may not teach that. I have no doubt that the students are instructed, but I do not think we have had any outside teaching in horse shoeing.

6511. And book-keeping?—Yes, book-keeping, certainly.

6512. I suppose the farm book-keeping is carefully observed?—Yes, most carefully.

6513. Is there any cattle breeding at the farm?—Yes, there is a good deal done in the way of encouraging the black cattle breeding.

6514. You have sheep on the farm?—Yes, and a considerable number of experiments of cross-breeding are carried on, but more particularly with the Welsh sheep with different kinds of rams.

6515. And poultry is kept at the farm?—Yes.

6516. If you had more money to spend, in what direction do you think more money ought to be spent?—

Mr. P. P.
Pennant.
6 June, 1907.

I think in the first place more money ought to be spent so that we might, when we had got a good man, be able to keep him; that I think is the most important way of spending the money.

6517. (*By Lord Barnard.*) Would you tell the Committee whether the Agricultural Department is separate and distinct from the rest of the college, or is it administered by the same body?—It is part and parcel of the college—certainly the financial part has to be kept separate.

6518. The accounts are kept quite separately?—Yes, the officers, the principal and professors of agriculture administer their own departments, but still they are under the supervision of the Senate.

6519. The sources from which you derive your revenue then are the Government grant, some fees of students, the County Council grants, and at one time you say you had some subscriptions. Are they still going on?—There are a few subscriptions, but when the County Council took the matter over, then the subscriptions partly disappeared. People said if they paid in one form it was not necessary for them to pay in another.

6520. How many Councils support this department?—Anglesey, Carnarvon, Denbighshire, Flintshire and part of Montgomeryshire.

6521. Is the attitude of those County Councils favourable to the department still?—Yes, certainly.

6522. They show no disposition to reduce their grants?—No. Take Flintshire, for instance, a considerable portion of that county is industrial and not agricultural, and there is, I might say, almost a perpetual discussion as to whether more ought not to be given to technical education and less to agriculture, and so on, but still we always carry the day in favour of giving a fair proportion to agriculture.

6523. In your opinion is there any risk if increased financial assistance were given by the Government of the County Councils reducing their grants?—No, not in the least. I think we should be able to use it rather as a powerful argument for an increase.

6524. I suppose you would agree with me in this, I had a similar experience to yours in the North of England with regard to the changing of teachers, that the whole system of agricultural education, not only at home but even abroad, is in course of rapid development?—Certainly.

6525. Perhaps that is one of the causes why teachers go away so frequently?—Yes.

6526. They are able to get better appointments elsewhere?—Yes.

6527. Do any of your teachers go abroad—to the Colonies?—Yes, some of our teachers certainly have gone abroad.

6528. We have found it so in our district that they do go abroad?—You do not mean to get a better place, do you?

6529. Yes.—We have not lost any in that way.

6530. You say that half the Committee which administers this department is appointed by the College?—Yes.

6531. Is that by the Council of the College—is it a Council?—Yes.

6532. Are any other members of the staff *ex-officio* members of the Agricultural Committee—I suppose the Principal is of course?—Are you speaking of the County Committees?

6533. No, I am speaking of the Committee, or whatever it is termed, which administers this Agricultural Department; I think you told us it consisted partly of representatives of the County Councils and partly of members appointed by the College?—I was speaking of the County Administrative Committees; they are formed in each County; half are appointed by the college and half are appointed by the County Councils.

6534. I will give you an actual instance of what I mean. Who appoints the staff when there is a vacancy, for instance?—The Council of the College would appoint the staff; the Council of the College of course is appointed by the Counties to a large extent.

6535. You have told us that farmers look with growing favour upon the institution as a whole?—Yes.

6536. In fact the department is not only an institution for instructing students, but it is very largely for disseminating improved information?—Yes.

6537. It is an Agricultural Information Bureau, you might almost say?—Yes.

6538. I assume the farm and the stock on it are probably typical of the district?—Yes.

6539. The Chairman asked you about fruit growing. I wondered whether fruit growing was an industry in the district?—No.

6540. I suppose it is principally sheep and cattle?—Yes. There is very little fruit grown. Our climate is not tip-top for fruit growing, particularly near the sea.

6541. (*By Lord Moreton.*) You told us just now that the attendance of the farmers at your lectures is most satisfactory. Do you find that the younger men, the farmers' sons, who are not actually in possession of a farm, but will, possibly, be some day attend well?—They do.

6542. To go back to the question that was asked you just now about farriery, I do not know whether it was to be confined to the college or only to the County Council work. Of course, you know the work of the County Council. Would you mind telling us if there have been any lectures on farriery in the district, not necessarily in connection with the college?—I could not tell you, but it is a subject on which, if it was asked for, it could be given.

6543. Apparently, as I gather from you, there is no very great interest taken in it?—No, I have not come across any.

6544. You are aware that in many parts of England considerable work is done on those lines?—Yes, and I think it is coming into our district, because we had some demonstrations of that kind at some of our local shows, and people seem to be beginning to take interest in it.

6545. As regards forestry and book-keeping and such subjects, I take it you would rather we questioned Professor Winter on those?—Yes.

6546. (*By Mr. Latham.*) I think you said when you first began talking about agricultural education in Wales that the farmers took very strong objections to it?—No. I think it was rather that they shrugged their shoulders at a man from Bangor coming to teach them anything.

6547. Possibly they were a bit older than their teachers?—Yes, very likely.

6548. Is that a fair illustration of the reason?—I have no doubt it would be operative.

6549. Then you said after the dairy schools began to be successful that farmers began to be intelligent and to think that there was a little more in it?—Yes.

6550. Was it simply and solely from your dairy teaching?—There is no doubt the dairy teaching had a good influence, not merely on dairying, but all round.

6551. You are not at all alone in that sort of thing. That showed the farmers that there was something to be done from enlightenment, and they were willing to receive it?—Yes.

6552. You spoke of the agricultural societies doing a great deal in the matter. Did they institute dairy schools and start them on their own account in connection with their agricultural societies?—The dairy school grew into existence in the way I have mentioned: there is no doubt it was the daughters of the farmers, then the farmers, and then some of the landowners. That was the way it grew, but it came from the dairy school in our centre; it was started in that way.

6553. You spoke of about 605 students paying fees, were they all dairy students?—Yes, of course they paid a fee, and the bulk of them merely saw demonstrations. Some of the likely young women received actual instruction of a little more elaborate character, and then we had a competition and gave a scholarship to two or three, which carried them to the dairy school at Llewenni for a six weeks' course.

6554. The 605 students could not have been accommodated in 12 months?—No, of the 605 perhaps some only came for one morning, but that was the number who actually paid.

6555. Then naturally their fees would be very small?—Yes, but that is the number who actually paid to come and see the demonstrations: we did not allow anybody to come who did not pay something.

6556. I quite understand. You gave us the number of 605 students to show the great interest that was taken in the work?—Yes; we got a national school, or some place of that kind in a village and held it there.

6557. My experience is that there have been a great

many lookers-on; but I have never heard of them being asked to pay before?—If they will pay something, it necessarily shows that they take a real interest in it.

6558. It practically comes to this, that the Agricultural Department was started by private enterprise?—Yes.

6559. Was it done by means of any charity?—No, it was for the promotion of agriculture.

6560. We have had evidence given in this room that people have left money in their wills for agriculture, and I am rather anxious to know whether this was done in that way or whether it was done by subscriptions from the leading men of the district. What was the private enterprise?—It was by landowners. The subscriptions to the college, which amounted to about £700 annually for a certain number of years; private subscriptions were almost entirely by landowners.

6561. Landowners subscribed for the benefit of their tenants, I presume?—Yes.

6562. You spoke of improvement in the grass land—or perhaps that question had better be left for Professor Winter?—Of course, we are very much a grass country now, although I can remember when much more than half, I might say, that is now in grass was tillage.

6563. For the size of it is this farm a prosperous one?—Yes. Of course, the farm is not conducted quite in the same way as a farm for profit would be, because it has to be a farm illustrating experiments, so that you must not expect to make a big profit. It pays its way, however, and if a farm that is all given up to experiments does that I think that shows it is a very successful one.

6564. (*By the Chairman.*) Do you pay rent for the farm?—Yes.

6565. (*By Mr. Latham.*) If you answer the question by saying you have no losses I think that covers it?—Yes.

6566. From the report of the Board of Agriculture I see your present stock consists of about 90 head of cattle, 1,600 sheep and lambs, and 18 horses. Is that so?—Professor Winter is the head of the farm, and he can give you those figures more accurately than I can.

6567. Perhaps he can tell us about the improvements also better than you can?—Yes; I live 40 miles from the farm, so I am only occasionally there.

6568. You spoke of the conference between the college and the representatives of the County Councils in 1891 resulting in arrangements for finance and administration which have secured the success of the department. I think Lord Barnard asked you if there was more money coming from outside, whether you had not some little doubt about the County Councils keeping up their grants, and I was rather surprised you answered so confidently?—I look upon Anglesey, Carnarvon and Denbighshire as much more largely agricultural than Flintshire. Flintshire would be the one where the industrial portion would be most likely to kick; but I think I have a perfect confidence in Flintshire standing fast; and I am sure the others, where the interests in agriculture and the representatives are much stronger, would certainly be able to hold fast.

6569. I think mine is a rather fair question, because in looking at this book of the Board of Agriculture I see your counties do give very little money to the colleges, and I suppose you are the recipients of it?—Anglesea, of course, is a small place. I think they give £150.

6570. Carmarthen gives nothing?—Carnarvon gives £330, Denbighshire £400 and Flintshire £250, and those would be grants about in proportion to their several sizes and the richness of the counties.

6571. How close is the college to Glamorgan?—Glamorgan would be near the Cardiff college—I do not think they have an Agricultural Department there.

6572. They do not take interest enough in yours, at any rate, to contribute to it?—Our work is confined practically to the four counties I have mentioned, and a portion of Montgomeryshire.

6573. Those that do not subscribe to your college have no agricultural education at all?—There is Aberystwyth College, you must remember.

6574. (*By Mr. Davies.*) With regard to the conference which you told us took place between the different counties that are interested in this department, does this conference meet now?—No. This was a conference that was called together in 1891 for the purpose of getting

the County Councils which had just been appointed into touch with the recently formed Department of Agriculture.

6575. Each county makes its own grant irrespective of what the other counties do?—Yes.

6576. With regard to the scholarships, I believe that each County Council does give scholarships to enable the students to go up to the Agricultural Department?—Yes.

6577. Do you think it would be a wise thing if all those scholarships were handed over to the college, and the college distributed them, or do you think that the present system of allocation by the County Councils themselves is preferable?—I think if the County Councils pay for them and decide how many they should send from their counties, that they would like to keep it in their own hands as much as possible, I am sure. I always find that County Councils like to spend their own money as much as possible.

6578. At present is not the system that they give a certain number of scholarships, but there is no examination, and that anybody can apply for scholarships?—Of course there are college scholarships, but the ones which the County Councils give from year to year are dealt with by the administrative committee that is formed partly by the college and partly by the County Council.

6579. In awarding these scholarships is there an examination held, or are they simply given on the recommendation of certain members of the Council?—There is no examination, but the recipients are farmers' sons; they come off the land.

6580. Would not you think it advisable that some sort of test should be held before a scholarship is awarded?—You see, in the first instance, we rather have to drag these scholars to the college; that however is changing rapidly, it is more appreciated now, and more sought after, but I think we have hardly arrived at the period where it will be necessary to have an examination in order to sort out the best candidates.

6581. So that really in fact you have to pay a certain number of students annually to go to the college—it comes to that?—Yes, but then they go home and permeate knowledge.

6582. I think you told the Committee that you consider the lectures which have been delivered in the counties have done a great deal of good?—A very great deal.

6583. Has anything been done in the way of evening classes for farmers' sons and labourers' sons living in certain localities where they could come for a fortnight or three weeks or a month's course preparatory to attending some of the short courses in the college?—No, I do not think anything has been done in that way.

6584. Do you think that is a practical suggestion?—Yes, I think so; you want people who would be willing to take a good deal of trouble on the spot, but I think it is a good idea; it never occurred to me.

6585. With regard to the experiments and demonstration plots, does each county have a plot of its own?—The Committees meet and allocate the money that they have to spend. They say, "This year we will spend so much in field experiments, and so much in extension lectures" and so on; then the college carry that out, and the Committees no doubt say, "John Jones's is a suitable farm, and no doubt he will be very glad to help you by letting you experiment with his turnips" and so on, and the thing is carried out in that kind of way.

6586. You do not have to pay for the use of the land?—No.

6587. You simply pay for manures, and seeds, and so on?—Yes, and if it is a hay experiment, cutting the hay and those sort of things.

6588. I think you told us that the students who go to the farm have no objection to working on the farm?—That is so.

6589. Does the college pay them for the work they do on the farm?—No, they pay them in the instruction they give them.

6590. I believe at a number of colleges abroad they actually pay the students for the work they do on the farms?—Yes.

6591. Does any machinery exist at present whereby the departments at Bangor and Aberystwyth have some means of comparing the experiments, and so on, that are carried on at each of the college farms? Is

Mr. P. P.
Pennant.

6 June, 1907.

Mr. P. P.
Pennant.
6 June, 1907.

there any co-operation between the two departments ?—There is no machinery of that kind in existence. I think the present head of the Agricultural Department at Aberystwyth is an old student from us, and I do not think there would be any difficulty in comparing notes, and, no doubt, it is done to a considerable extent ; but there is no actual machinery in existence.

6592. Do you think it would be advisable if there were, as the problems they have to grapple with are more or less similar ?—Yes, I think it would be ; but certainly we have our hands very full as it is.

6593. You have a forestry course at Bangor, have you not, which does not exist at Aberystwyth ?—Yes.

6594. Do you know that some attempt has been made to establish a similar department at Aberystwyth ?—I do not know about that. As far as I am aware, two grants were made for forestry—one, I think, to Newcastle and the other to Bangor.

6595. Do you think one forestry department is quite sufficient for the needs of North Wales, at any rate, and that the department at Bangor could suffice for many years to come ?—I do not know about that. Of course, there is a great deal of land which could be very advantageously planted in Wales, and I could not say what a forestry department might grow to, but for a beginning what we have is sufficient.

6596. Is there an agricultural library at the college ?—Yes.

6597. Is it a circulating library from which farmers living in the county can get books ?—No, I think it is only used by the students.

6598. Do you think a circulating library at the headquarters of the college, whereby farmers might be able to get agricultural text books very easily, might be of benefit ?—Farmers are not great readers, you know.

6599. But the young men who have left the college and who wanted to keep up their college studies might find that very useful ?—That is so.

6600. Do you find that the farmers in your district are interested in research work ?—The research work is a little above the heads of the ordinary farmers.

6601. Do they realise the value of it ?—Yes, they do, certainly.

6602. They do not object to money being spent in that way by the college ?—I think a certain number would appreciate it, but the average farmer thinks a great deal of practice, and not much of science.

6603. (By Mr. Medd.) Is each affiliated county represented upon the Council of the Agricultural Department ?—They administer their own money in conjunction.

6604. You have a Council or governing body for the Agricultural Department ?—Yes. The Council of the College is appointed—of course there are a certain number of *ex-officio*s—by what is called the County Governing Body. That represents County Councils and original subscribers ; the Council is practically formed in that way.

6605. As a matter of fact each affiliated county has a voice in the organisation and work of your Agricultural Department ?—Yes, certainly.

6606. Could you kindly give the exact amounts contributed by each county. There is a very confusing statement here in the Board of Agriculture report, in which it says : "The County Council grants amounted for the previous year to £1,860, of which, however, a considerable portion had been due for the previous year." Perhaps you would kindly tell us the actual amount given to-day ?—I believe I am correct in saying that last year Anglesey gave £150, Carnarvon £330, Denbighshire £400, Flintshire £250, and Montgomeryshire £70.

6607. Montgomery did give something ?—Yes ; £70, I think.

6608. There is nothing down here for Montgomery. That makes a total of £1,200 ?—Yes.

6609. So that your local contributions are £50 less than the amount you received from the Board of Agriculture ?—Yes. Then there was a certain amount of subscriptions, but I really forget what they would be.

6610. What I may term the permanent local contributions are somewhat lower than the grant you received from the Board of Agriculture ?—We receive from the Board of Agriculture £800 I think.

6611. £800 and £200 and £250—£200 for the farm

and £250 for the forestry, making £1,250 altogether ?—Yes.

6612. Do you find any difficulty arising from the fact that Montgomeryshire is divided, half coming to you and half going to Aberystwyth. Does it make it more difficult to organise Montgomeryshire in any way ?—I should think very likely.

6613. I mention it because Mr. Marshall Dugdale in his evidence before us the other day referred to the difficulty of locomotion, and he suggested it would be preferable if the northern half of Montgomeryshire were affiliated to Aberystwyth and the northern half of Merionethshire went to you. Has that been brought before your Council at all ?—No, it has not.

6614. You will see from the map what I mean ?—I think the Counties settle themselves where they go.

6615. I merely mention it because it was a suggestion to which he drew attention ?—Yes.

6616. Does the Council of the Agricultural Department confer annually with these different counties as to a scheme of agricultural education in each county ?—Yes. We have a meeting at the beginning of the year and decide how money shall be spent.

6617. In each county ?—Yes—at least, I cannot say what happens in Montgomeryshire, but I can speak for the other four counties.

6618. Because at present the amount of agricultural education given in these different counties is very slight from the Report. Would you be prepared to co-operate with the local authorities of the counties in organising a definite scheme of agricultural education from the elementary school up to you as the collegiate centre in each county ?—I think it is the sort of thing we should like to see.

6619. To-day you have no permanent institution for intermediate agricultural education—that is for the son of the small farmer or the labourer—in any county ?—No.

6620. Your work is confined to lectures, and I see occasionally a little charlock spraying, and spraying for potato disease, and so on, but there is nothing permanent, is there ?—It is so far permanent that there is a good deal done every year.

6621. By "nothing permanent" I mean to say that it is only, perhaps, for two or three weeks' lectures, or it may be only a one-day lecture. It is not anything in the nature of a school or continuous course ?—No.

6622. Probably you will agree with me that it is all important that the son of the small farmer and labourer should have effective opportunities for learning ?—Yes, I think it would be extremely desirable.

6623. Of course, it is almost entirely a matter of organisation ?—Yes.

6624. Perhaps you would agree with me in this that if one is to appeal to the Treasury for more grants on behalf of agricultural education, it is essential to provide for these classes that are at present more or less neglected ?—Yes. We have a very good set of intermediate educational schools and I should like to graft agriculture on to those.

6625. Would you think it advisable to have anything of a distinct agricultural nature incorporated with your intermediate schools ?—You must have some sort of organisation and there is one in existence.

6626. Probably you may not have had any experience of what are called winter schools in other countries which are of a permanent character ; they have them in Ireland and they have them in Holland ?—We tried—at least I tried—to get one of our intermediate schools in Flintshire turned into what I may call an agricultural school to a large extent, but it failed from want of money.

6627. Of course it is a question of money ?—Yes.

6628. That, of course, would be of the grade that I am alluding to, and it would be the character of institution that I mean ?—Yes.

6629. Of course, each county could not support such an intermediate school of its own ?—No.

6630. But such an intermediate school could become the intermediate centre for your area ?—Yes. We tried to form those for Flintshire and Denbighshire, but we failed merely for want of money.

6631. The idea is one which commends itself to you ?—Yes ; very much indeed.

6632. And which you would carry out if you had the funds?—Yes.

6633. You have expressed your desire for additional grants?—Yes.

6634. The total number of students in attendance at Aberystwyth last year was only 37?—That is so.

6635. That looks very small before the public. Of course you do other very valuable work; but if you are to press the claims of agricultural education upon the country and obtain larger money, do not you think that you must show that you are educating, either at your centre or at other centres, a very much larger proportion of pupils than 37 as compared with the cost?—Yes.

6636. Probably you will agree with me that that is a point which you must, I think, emphasise before the country?—Yes.

6637. The number here, 37, seems hardly commensurate with the expenditure?—Yes, from that point of view.

6638. (*By the Chairman.*) Do you consider that more should be done and could be done to give agricultural education to the labourers?—Yes.

6639. In what way?—To begin with, I should like to see the elementary schools have much longer holidays and the children going on the land. A child that is kept in school too much when it is at that age, and does not go into the fields and mix with the cattle and so forth never will make an agricultural labourer. For instance, he is afraid, I was going to say, of a bull, but he is afraid of a calf. You may see a child of five or six years old drive half-a-dozen cows, if he has been living on a farm; and that is one of the things that you want with the agricultural labourers' children, if they are to become agricultural labourers when they grow up. They want accustoming—I do not say that it is actual instruction given—but they want to be in the habit of being on the land and mixing with bullocks and cattle and sheep, and so forth, and knowing what animals do, and also seeing operations going on; and then the thing comes much more naturally to them; and I fancy that the Swiss plan of giving longer holidays to the children in the summer time is a very good one. I should like to see that plan adopted more in this country. Then, of course, you can carry on their education by evening schools, and so forth, later on so that in the end they have as much "book learning," as they would call it, and yet at the same time they have their minds instilled more with ideas of agriculture. Then there is another reason, while talking on this subject, why children in school are so anxious to go to the town, and do not turn into good agricultural labourers. That is this: that most schoolmasters are what I call town-bred people; they have not agricultural minds. Their illustrations in their lessons are as to what happens in the towns, the lighting of towns, the grandeur of the shops, and all that kind of thing. The consequence is that the children when they go out and leave school their idea is, "Oh, what a grand place town must be." Now, if more of

our schoolmasters were country-minded individuals, the illustrations in their lessons would be that the cows do this and that, and they would illustrate it by the hay and cutting the corn and all those sort of things; and then, when the children left school, their minds would run upon this class of subjects. I believe there is a great deal in that kind of thing; and I, as far as I have been able to, have always tried at the training colleges that I have had anything to do with to let them take a certain number—I take all the best into the training colleges of course—but to take a certain proportion from the town and a certain proportion from the country, because in a training college what you have got to do is to form a good instruction for youth, and you want a certain number for the country and a certain number for the town, but if you get all the best and sharpest pupils, and they are the pupils who go to the training colleges, from the town you are getting instructors who are suited to teach in the towns, but are really unsuited to teach in the country.

6640. Your view is that the teacher should think agriculturally?—I do. I think it is a thing of the greatest importance; and then it would be so very much more easy to graft a little more agricultural observation on the children.

6641. Do you think that a system of apprenticeships for young farm labourers on farms where some trouble should be taken to give them instruction might be useful?—Yes. Of course, I have seen that done to a slight extent in connection with cheese-making farms where it would be very important, but I have not seen it, I think, beyond a cheese-making farm.

6642. But that could be done?—Yes.

6643. It would obviously be in the interest of farmers to encourage these apprenticeships?—It would. Of course I know a certain number of instances of that description.

6644. Might I ask, supposing there is a deficit in the balance sheet of the Agricultural Department of the College, is the University responsible in that case?—No.

6645. Who is responsible?—We should have, I think, to make an appeal to the County Councils; that would be the only resource.

6646. The County Councils are not responsible?—No.

6647. The University is the responsible body for the Agricultural Department?—They are, yes; but I do not think financially they are responsible. No, I say we should have to appeal to the County Councils. I think that the University College from the financial point of view have taken care that they are not responsible; but Professor Winter can tell you better.

6648. Very well, I will put that question to Professor Winter?—Yes, when the Agricultural Department was formed they were very careful to take care that it should not trench on the funds of the College.

6649. I meant, of course, the College of Bangor, not the University?—Yes, the College of Bangor.

Mr. P. P. Pennant.

6 June, 1907.

Professor THOMAS WINTER, M.A., called and examined.

6650. (*By the Chairman.*) You are Professor of Agriculture at the University College of North Wales at Bangor?—Yes.

6651. How long have you been at the college?—I went there first as an assistant lecturer in the session of 1891-2, and stayed for nearly two years. I was then on the staff of the Yorkshire College for rather less than a year, and went back again to Bangor as head of the Department of Agriculture. That was in 1894, and I have been there ever since.

6652. What do you yourself teach at Bangor?—Agriculture.

6653. Perhaps you will give the Committee an outline of the scheme of agricultural education at the college, both in-college work and out-college work?—The statement I have prepared will, I am afraid, in some respects overlap what you have just had from Mr. Pennant, but

6653a I will run over it as quickly as possible. The agricultural

department of the college had its origin in a course of lectures on agricultural chemistry, with special reference to the chemistry of soils and manures, delivered by Dr. Dobbie, who at that time held the chair of chemistry in the college, in the spring of 1885. The lectures were delivered at the request of the farmers and landowners of Anglesey, who formed a committee to make the arrangements in connection with the course and to provide for the expenses connected therewith. The course was accompanied by an extensive series of experiments on the manuring of swedes. The experiments were conducted on eleven farms in Anglesey and one farm in Carnarvonshire, and the interest excited in them was very considerable. The report on the results was issued in 1886 and was translated into Welsh at the request of the farmers. The experiments were primarily of an educational character, their principal object being to demonstrate the effects of various kinds of manures upon the swede crop.

In the Session 1886-7 Professor Dobbie lectured again

Prof. T. Winter.

Prof. T.
Winter.
6 June, 1907.

at Llangefni on the chemistry of foods and feeding stuffs.

In the course of Session 1888-9 Parliament for the first time voted a sum of £5,000 for the promotion of agricultural education, and placed the money in the hands of the Agricultural Department of the Privy Council for distribution. On the ground that the college had been engaged in the diffusion of agricultural education, and was actually so engaged at that time, a class similar to that held at Llangefni being in progress at Welshpool, application was made to the Privy Council for a share of the grant. An inspector of the Privy Council visited the college and held an inquiry into the work which had been carried out, and in consequence of his report a sum of £200 was granted to the college in November, 1888.

OUTLINE OF SCHEME.

Soon afterwards (January 14th, 1889) Dr. Dobbie submitted to the Council of the College, in the form of a letter addressed to its Chairman, an outline of a scheme for providing a comprehensive system of agricultural education for North Wales in connection with the University College at Bangor. This scheme met with the approval of the Council, and an influential committee was appointed to take the necessary steps to carry it into effect.

The object of the scheme was two-fold :—

- I. In-college instruction, embracing a systematic course of study in agriculture and the several sciences upon which it is based.
- II. Out-college work :—
 - (a) Dairy work, in three fixed dairy schools and in travelling dairies.
 - (b) Extension lectures to farmers.
 - (c) Field experiments.
 - (d) Classes for elementary schoolmasters.

In order to carry the scheme into effect—

(A) Public meetings were held throughout North Wales for the purpose of explaining its provisions and eliciting the opinions of farmers.

(B) A large number of the newspapers circulated in North Wales were induced to take an interest in the movement, and published leading articles in support of it.

(C) A considerable number of landowners and public men were visited by members of the committee for the purpose of explaining to them fully the aims of the college and the methods proposed. In this way much information as to the requirements of different parts of North Wales was obtained and many valuable hints were received.

6653b FAVOURABLE RECEPTION BY THE AGRICULTURAL POPULATION.

To this appeal all classes responded heartily.

(A) Landowners promised subscriptions, which in 1888-9 already amounted to £500 per annum, and subsequently increased to £750. Many of them also supported one or other of the dairy schools and gave land and labour free for experiments.

(B) The farmers subscribed liberally to the dairy schools. In the original list of the Anglesey and Carnarvonshire Dairy School, farmers formed the great majority of the shareholders. They contributed also to the local expenses and many supplied land and labour free for experiments.

6653c No better evidence of the general interest felt in the movement could be given than the fact that in a single year, in addition to the large sums subscribed directly to the agricultural fund of the college, money was also found for the establishment of three dairy schools at such widely different centres as Denbigh, Welshpool and Bangor.

(N.B.—Mr. Ralli, of Rhyl, had already provided £300 for this work in Denbigh before the college began to organise the dairy schools.)

6653d In the same Session the scheme was so far worked out that courses of lectures were given at Wrexham, Bala, Welshpool, and Pwllheli; field experiments started in

Montgomeryshire and Carnarvonshire, and the first class for elementary teachers held at Bangor. The progress was considered so satisfactory by the Privy Council that the grant was doubled for the following year.

1889-90. At the beginning of this Session special lecturers were appointed to lecture on agriculture and other subjects, and an in-college course of instruction was also instituted.

In the course of the Session the out-college work was also extended in all branches.

6653e CONNECTION OF THE AGRICULTURAL DEPARTMENT OF THE COLLEGE WITH THE BOARD OF AGRICULTURE.

In the year 1889-90 a deputation of representatives of the college, headed by the late Earl of Powis, then President of the college, was received by Lord Cranbrook at the Privy Council office in order that they might lay before the President of the Privy Council an outline of their scheme for agricultural education. The President assured the deputation of his sympathy, but before the close of the year the duties of the Agricultural Department of the Privy Council were transferred to the new Board of Agriculture.

At the request of Major Craigie, head of the Statistical Department of the Board of Agriculture, a statement was prepared by Dr. Dobbie showing how far the college scheme was then in operation and what developments were aimed at in the future. The Board of Agriculture approved the scheme and recommended it as a model for similar work at other collegiate centres.

The connection between the Board of Agriculture and the college has doubtless tended to inspire confidence in the agricultural population.

6653f CONNECTION OF THE AGRICULTURAL DEPARTMENT OF THE COLLEGE WITH THE COUNTY COUNCILS.

With the establishment of the County Council system, which was not in operation at the time that our agricultural work was begun, it was felt that the department might reasonably expect considerable assistance from the Councils in carrying on its extension work.

The Carnarvonshire County Council was the first to associate itself with the scheme (June, 1891.)

A report was issued by the Joint Education Committee of the County Council, based on the evidence given before the Committee by a member of the College Council and Dr. Dobbie. In this report attention was drawn to the powers which local authorities possessed under the Technical Instruction Act for dealing with agricultural education, and recommendations were made as to the best methods of utilising the College organisation.

The County Council adopted the report and voted a sum of £250 a year for the work. This grant has since been increased to £330.

Since then the different County Councils of North Wales have agreed to co-operate with the College, more or less on the same lines as Carnarvonshire.

PROGRESS OF THE WORK.

I.—IN-COLLEGE.

6653g Five in-college courses have been arranged to meet the requirements of different students :—

(1) Course qualifying for the degree of B.Sc. in Agriculture in the University of Wales. This course extends over three years subsequent to matriculation. At the end of the first year students take the intermediate examination in physics, chemistry and botany or zoology. In the final examination at the end of the third year agriculture is taken along with two pure science subjects.

(2) The Diploma course, which extends over two years and is intended for farmers and land agents.

(3) Course for students of the Day Training Department who remain at the College for a third year and who intend to teach in rural elementary schools.

(4) A short course of eleven weeks during the autumn term, intended for farmers' sons who are only able to leave the farms for short periods during the autumn and winter seasons.

(5) A course in forestry extending over one year.

6653½ The average number of students in the Department for the last twelve years has been 34. During the present session there have been 35.

About one-half of these students have been short-course students, not many of whom are under 20 years of age, and some of whom are usually over 30. Nearly all of them are sons of farmers. Several of them come up for second courses, and in nearly every case they return to the farms. Many of them come up badly prepared, but as they are serious students, they usually make rapid progress. During the sixteen years that I have been engaged in agricultural teaching, no work that I have done has given me greater satisfaction than the teaching of these short-course students.

6653; Few elementary teachers have taken advantage of the course provided for teachers in rural schools. It must be remembered, however, that teachers in town schools command higher salaries than those obtainable in the country districts, and until the teaching in rural schools is arranged on different lines there is not likely to be much demand for such a course as we have provided.

Of those who have taken our longer courses many have obtained good appointments, both in this country and abroad. A number are engaged in teaching and lecturing, some in land agency, and the rest have become farmers.

The numbers attending the in-college courses have on the whole been rather disappointing. Possibly they might have been greater had we spent more money in advertising. As our income has never been sufficient for our needs, we practically ceased to advertise 10 years ago, and for the last seven years no money has been spent in advertising the department.

6653; Although we have not for some years had any increase in numbers, signs of encouragement are not wanting. For many years nearly every student who came to the department did so as the result of canvassing in some form or other. Canvassing is no longer necessary, and I have little doubt that in the future our numbers will increase. Several farmers have told me during the past year that they were going to send their sons to college; not long ago an invitation would probably have failed to bring them. A great number of farmers in North Wales are what may be termed working farmers, and in cases where a farmer's son attends the college an extra man has to be employed on the farm.

II.—OUT-COLLEGE.

6653k *Dairy Work.*—As no public funds were available, the dairy work in connection with the college was at first carried out by three limited companies founded at Sylfaen, near Welshpool, in Montgomeryshire; Lleweni Hall, near Denbigh; and at Bangor. The capital of these companies was subscribed by landowners, farmers and others who were interested in the work. At Sylfaen nearly £700 was paid up, at Bangor £430. I have not the exact figures for Lleweni, but I think the capital subscribed was about £500.

At Sylfaen and Lleweni both buttermaking and cheesemaking were taught, at Bangor buttermaking only.

For the first two years pupils were received at the schools for periods of six weeks, but in 1891 outside demonstrations were given, and in the following year classes for the instruction of pupils were arranged at local centres, each class extending over 10 days.

For some years the local dairy classes were held during the early part of every summer, and during the latter part the best pupils were drafted from the local centres to the fixed schools for further instruction.

Owing to lack of funds, the school at Sylfaen was given up in 1896, and since 1901 no work has been done in connection with the Bangor school, and no outside classes have been held in connection with Lleweni, which is now the only dairy school worked by the college.

At Lleweni over 900 pupils have passed through the school, at Sylfaen 124, and at Bangor 202. The average period of instruction at Lleweni and Sylfaen would not be less than six weeks; at Bangor, where buttermaking alone was taught, the pupils did not remain on the average for more than three weeks.

Between 1892 and 1901, 133 Dairy classes were held at local centres, at which 1,674 pupils received instruction for a period of ten days. I do not refer to spectators. These were actually working pupils.

The school at Lleweni is still in a flourishing condition and much more work might be done there if funds were available. At one period a number of pupils came to the school from England with a view of obtaining instruction qualifying them for teaching appointments. We have now ceased to cater for this class and those who attend the school are almost without exception the daughters of farmers in the neighbouring counties.

There has on the whole been more demand for dairy work in Denbighshire and Flintshire than in other parts of North Wales. In parts of those counties cheesemaking is carried on to a great extent and improvement in the manufacture of cheese is always followed by an increase in price. In Anglesey and Carnarvonshire, although in some cases pupils of the School obtain better prices for their butter, in a great many cases they do not. Montgomeryshire is not a typical dairy county, but signs are not wanting that the closing of the Welshpool School has been a loss to the district. In a letter which I received from the Chairman of the Montgomeryshire County Council a short time ago he states that "if funds were provided the establishment of a dairy school under the management of the University College of North Wales would be of great benefit to Montgomeryshire."

With regard to the dairy work generally, there can be little doubt that the teaching given has not only resulted in an improvement in the dairy produce, but also has brought about marked changes in dairy management and in the sanitary conditions under which dairy work is carried on. As, however, inferior butter practically makes the same price as good in some of the local markets, and as local butter always makes a much higher price than foreign or creamery butters, especially in Anglesey and Carnarvonshire, a great many farmers see no reason for making a change in their methods. We happen to have some very good butter markets, and the majority of the people prefer the local butter, which usually makes from 3d. to 6d. a pound more than any creamery or foreign butter that comes there.

6654. Are there any creameries in any of the counties? —No.

6655. Why is that?—Because the people can make a better price for their stuff as it is. During the last year or two the tendency has been for the local butter to fall in price, and I have little doubt that in the near future there will be an increasing demand for dairy instruction. Local butter has been coming down in price, while the imported butter is holding its own. I suppose that people are gradually getting accustomed to the creamery or foreign butter. The prices of the two articles are coming closer together.

6656. (*By Mr. Latham.*) I thought you said just now that the local butter made the most money, even if it was not the best?—It does.

6657. Teaching really will not have much to do with that?—No, but the price of local butter is coming down; I suppose it is owing to change of taste. I can tell by our own butter at the farm; we can always get far more for our butter than is paid by imported butters. Butter in Bangor last week was about 1s. 3d. to 1s. 4d., and you can buy these creamery butters, and the Irish butters at 1s. I have known the local butters making 6d. a lb. more, but we do not get that now; the prices of the two articles are closer together.

6658. Is that because of a feeling that it is made by native labour?—No I do not think that is the reason; it is a highly salted butter and of a peculiar flavour, and it is a butter that perhaps will go further.

6659. The taste of the Welsh people must be educated before they will eat the other butter?—Perhaps that is so.

Extension Lectures.—Extension lectures on agricultural subjects (*list of subjects handed in*) have been given in all parts of North Wales. In the Welsh-speaking districts these lectures have been almost entirely in Welsh.

That the lectures have been appreciated is shown by the fact that they create even greater interest to-day, and are attended by even better and more representative audiences than was the case when they were started eighteen years ago. During the present Session we have only been able to give about half the lectures for which we received applications.

During the eighteen years in which the department has been in full working order 111 lectures in agriculture have on the average been delivered every year, with an average attendance of 39. During the present college

Prof. T.
Winter.

6 June, 1907.

Prof. T. Winter. year 117 such lectures have been given, with an average attendance of 46.

June, 1907. Most of these lectures have been delivered in small villages in thinly populated districts, situated in some cases as much as fifteen miles from a railway station.

Usually four lectures are given at each centre.

Such subjects have been dealt with in the lectures as the cultivation and manuring of soils, farm crops, foods and feeding, the breeding and management of live stock, the laying down and management of pastures, dairying, diseases of crops and insect attacks, poultry keeping, cultivation of vegetables in cottage and market gardens.

6659b From time to time efforts have been made to induce farmers to co-operate, and for the last four years agricultural co-operation has been one of the subjects on which lectures have been given. I have no hesitation in saying that it is almost entirely owing to these lectures that agricultural co-operation societies are now springing up all over North Wales.

6659c In connection with the extension lectures small libraries of books dealing with the subjects of the lectures have been formed. They are sent to the local secretaries at the different centres, who distribute them among the members of the local classes and are responsible for their safe return.

6659d *Field Experiments.*—Since the first field experiments were carried out by the College in 1884, experiments have been made at some 500 different centres in North Wales. For some years the experiments were confined to the manuring of field crops, varying in character from mountain pasture at 1,000 feet above sea-level to the ordinary cultivated field and garden crops in the low country.

From time to time fresh subjects have been dealt with, such as the laying down of grass land, seeding of corn, growth of new varieties of plants, destruction of weeds in corn crops, prevention of potato disease, and effect of change of seed on crops.

From the outset every effort has been made to make the experiments suit the requirements of the different districts, and as farmers do not, as a rule, care for long reports, the results of the experiments have been summed up in as few words as possible, and issued in the form of leaflets.

6659e There can be no two opinions that since the foundation of the department at Bangor there have been great alterations in the farm practices of North Wales. For example, the practice of manuring may be said to have undergone a complete change. Manures are now freely used which were then practically unknown, and, generally speaking, farmers have a much better idea what manures to use and the quantities to apply than they had some years ago. It is interesting to recall the fact that the College was the first public institution to carry out experiments with basic slag. At that time probably not five per cent. of our farmers had ever heard of it. If I say that 20,000 tons of basic slag are now applied every year in North Wales I shall not be overstating the case.

Fifteen years ago the majority of farmers in many parts of North Wales seeded their land with seeds from the hay-loft. Although the practice has not entirely been given up, the great majority now make a point of purchasing good, well-cleaned seeds.

With regard to seed generally, it may be stated that the old belief that what was not good enough to sell would do for seed now finds no favour.

It is always easier to note effects than to determine their causes. There is, however, sufficient evidence to show that those in North Wales who are best able to form opinions on the subject hold that the College has at least played a conspicuous part in bringing about whatever changes have occurred.

6659f *Classes for Elementary Schoolmasters.*—The scheme drawn up by the college in the first instance included instruction for elementary teachers. During the years 1888-1893 classes were held at Bangor, Blaenau Ffestiniog, Wrexham, Newtown, Bala, Rhyl, Welshpool, and Pwllheli. The courses at most of these centres extended over two years. During the first year instruction was given in elementary chemistry and botany, followed by agriculture; and in the second year lectures were given on chemistry and zoology as applied to agriculture, followed by more lectures on agriculture. The lectures were given on Saturday mornings, and whenever possible farm excursions were arranged for the Saturday afternoons.

Saturday classes for schoolmasters in mensuration, surveying, and entomology, have also been held at Bangor and Newtown, and on one occasion a summer vacation course for teachers, extending over three weeks, was held at the College, the subjects being chemistry and agricultural chemistry.

These courses, which were attended by over 400 teachers, had to be given up for two reasons:—

(1) Owing to lack of funds.

(2) The teachers received no encouragement from the Board of Education, and when they found that attendance at Saturday classes did not enable them to increase their stipends, many of them naturally refused to give up their weekly holiday.

I have always regretted that we were obliged to discontinue them, as I believe that had they been continued with some modifications they would have enabled the teachers in rural schools to give the instruction in "Nature Knowledge" which is now in such demand, and would have placed them in a better position to assist in solving the problem of rural education.

COLLEGE FARM.

Ten years ago the Department took a farm and raised £4,000 by public subscription in order to stock it.

The farm is situated at Madryn, about midway between Aber and Llanfairfechan stations, on the Chester and Holyhead Railway. It is about six miles from Bangor, a distance covered by train in about ten minutes. In area it covers 660 acres, of which about one-half is arable and pasture land of fair quality, well suited for the growth of a diversity of crops. The remainder is an upland sheep-walk. The farm buildings, which are extensive and well-equipped, provide accommodation for a large head of cattle. Owing to its varied character, the farm offers great facilities to students for acquiring a knowledge of different kinds of farming.

Experiments have been carried out on a variety of subjects, and as Welsh farming depends chiefly on live stock, many experiments have been conducted on the breeding and feeding of farm animals.

What is perhaps the most important work done at the Farm cannot strictly be described as an experiment. I refer to the efforts put forth by the College to foster and develop the native breeds of stock. In this work the farm has been of great assistance. The Board of Agriculture have not in the past given much recognition to work of this character, but as British farming depends now, more than ever, on its live stock, I hope that the Government will take the question in hand and give financial aid. Assistance such as is being given to stock-breeding in Ireland is equally necessary in many parts of Wales and would, I am sure, be not less appreciated. It is often urged that such work may well be left in this country to private enterprise. I am afraid that in most instances this is only another way of saying that nothing will be done.

Unless vigorous methods are adopted there is great danger that the Welsh cattle will be driven out of their best markets in England by the cattle from Ireland, which are already showing great signs of improvement, owing to the assistance which has been given to stock rearing by the Irish Department of Agriculture and Technical Instruction.

The rent of the farm is £500 a year, which is brought up by rates and other charges to nearly £600.

The stock kept usually varies from 80 to 100 cattle, from 1,100 to 1,200 sheep in winter, to 1,700 or 1,800 in summer, and from 15 to 20 horses.

We have from the outset received the grant of £200 a year given by the Board of Agriculture to all such farms, but beyond that we have had no financial assistance whatever, save a donation of £20 a year for the last three years from the Carnarvonshire County Council.

When the farm was first taken we had not raised any of our capital, so that for the first year we were farming almost entirely on money borrowed from the Bank, and for some years the interest on overdraft was heavy.

The interest taken in the farm by the agricultural population has been steadily increasing, and some hundreds of farmers from different parts of North Wales now visit it annually.

FORESTRY.

Some ten years ago we arranged a deputation to the Board of Agriculture inviting the Board to make us a

grant to enable us to start a Forestry Department. Nothing came of our visit, and it was not until 1904 that we received a grant of £250 a year for Forestry. We at once appointed a lecturer, and the Department is now in working order.

The in-college course in forestry extends to about 100 lectures, and the indoor work is supplemented by outdoor excursions.

Comparatively little has been done in regard to extension lectures. Two short series of evening lectures have been given—one in Montgomeryshire and the other in Bangor.

At Chirk, in Denbighshire, an area of 50 acres is being devoted to experiments in forestry conducted by Mr. F. Storey, our lecturer in forestry. This promises to be of much educational value to students at Bangor. Already fully one-third of the ground has been planted, the remainder of the necessary plants are being propagated in a home nursery, and the work will be practically completed next year. Mr. Mahler gave the land to the County Council, but the scheme has been worked in connection with our college.

6660. (*By the Chairman.*) Are those 50 acres woodland?—It is hill land.

6661. You pay no rent for it?—No; the land was handed over to the County Council as a free gift. The County Council have to provide the necessary expense in connection with the working of it, but it is not very much.

6661a One of the duties of the Lecturer in Forestry is to visit the estates of landowners who require and are prepared to pay for his advice. Some of the principal estates in North Wales have been regularly visited, and it is interesting to note that on these estates considerable changes have taken place in the treatment of the woods—modern methods having been adopted in every case.

Single visits of inspection have also been made to other wooded properties, and reports, with recommendations for future management, have been issued. The woods on at least one estate have been placed under a systematic working plan through the drawing up of an organised scheme of management which is being acted upon.

The advisory work may be expected to develop considerably as the department becomes better known.

FUTURE DEVELOPMENTS.

6661b No development is possible unless we get a substantial increase in our grants. Up to the present the department has been starved through want of funds. There are many branches of agriculture with which we have been unable to deal satisfactorily, as our funds will not permit us to engage the necessary staff for carrying out the work. For the ordinary work of the department we have been obliged for the most part to take men who have had no experience. After getting the necessary experience at the expense of North Wales they have found no difficulty in securing more highly paid posts elsewhere. For the same reason we have never been able to retain our best students, even when we wished to do so. At the present time there are at most of the agricultural centres in Great Britain men who have been at Bangor either as members of the staff or as students.

6661c North Wales is thinly populated, and as its main industry is agriculture agricultural education is much more necessary than in thickly populated manufacturing areas, and yet the latter have usually funds more than enough to do all they require in this direction, while the poorer districts have to struggle for existence. Some discrimination would appear to be necessary in allocating grants so that the poorer and more purely agricultural districts may not be placed at a disadvantage as compared with the rich manufacturing centres.

6661d This lack of funds from Government sources has made our very existence as a centre for outside work dependent on grants from a number of County Councils. These grants have to be annually renewed so that it is a somewhat difficult matter to secure that continuity which is necessary for successful work. It is impossible to feel secure even when you know that your work has been well done. I do not for one moment wish to cast any reflection on Welsh County Councils, which have given us loyal support, but it is obviously impossible for public institutions or individuals to give their best work unless

they have reasonable security that funds will be forthcoming to carry out whatever is undertaken.

Agricultural work in Wales has always been paid for at a very low rate. As a case in point I may mention our travelling dairy schools, which on the average cost us little more than £10 for a class extending over ten days. I have been privileged to assist in such work undertaken by an English college where the payment was at the rate of £25 for every class.

6662. (*By Mr. Medd.*) What was the length of that class in England?—Ten days.

6663. The same length?—The same length exactly.

Although we have given for many years a large number of lectures and carried out a great number of field experiments, after paying all expenses the sum left in the hands of the college for the payment of the salaries of those engaged in the work has never exceeded £300 per annum. I suggest that the Government grant of £800 a year to a centre such as ours should be increased to £2,000, and that the farm and forestry grants should be increased in the same proportion. It would then not only be possible to do more work but it would also enable us to do work of better quality. We should also be in a position to retain the members of our staff for longer periods, to appoint experts who would devote the whole of their time to such subjects as horticulture and poultry management, and opportunities would be afforded to members of the staff to devote time to research work, which at present they can only do under the greatest possible difficulties.

There can be no doubt that there is great need for agricultural research, and, as the teachers at educational centres are brought into direct touch with the agriculture of their districts and have every opportunity of becoming familiar with its varied needs, they would, if they knew their business, be more likely than anyone to initiate useful research, provided the necessary funds are available and they have the time to do the work.

I am not questioning the value of a central research institute, but it must, I think, be remembered that the council of such an institute, drawn as it would be from all parts of the country, would not be likely to prove an effective body, and unless the Board of Agriculture exercised its authority—and this is to be deprecated on many grounds—the director of such an institute would be the controlling force, and however competent he might be in some directions, he could never have such a wide acquaintance with the varied aspects of the agriculture of different districts as is acquired by the staffs of the colleges in their particular areas. In consequence of this the work done at the institute would tend to turn in certain grooves, and would, therefore, be of much less value than it ought to be to the country as a whole.

We should like to develop our forestry department by providing a small forest area, say of 30 acres, for investigation and instruction; a forest nursery, of say half an acre, where students might be taught how to propagate plants; an arboretum, in which the students of forest botany would be able to study individual characteristics of trees; and a forestry museum, in which would be collected and arranged forestry implements, models, timber sections, fungi, specimens showing damage done by various pests, instruments used in forest mensuration, seeds, plants, and forest products generally.

There is just one other matter to which I should like to refer. One of our students, who is shortly returning to India to occupy an important position, has recently been spending some time on the Continent in order to see something of continental agriculture, and of the educational methods employed. One of the things which struck him most was the fact that wherever he went he met men sent by nearly all European Governments and those of North America, but that he never by any chance met Englishmen. It is impossible at present for most agricultural teachers in this country to travel unless they have got private means. If the Government were to set aside a fund, say, for travelling fellowships, which could be held both by teachers and students, they would be conferring a boon on agricultural education, the effect of which cannot readily be estimated.

6664. (*By the Chairman.*) Did I understand you to say that for many reasons the control of the Board of Agriculture of what we might call central research is to be deprecated?—How do you mean by control?

6665. Would you read that sentence again as to the

Prof. T.
Winter.

6 June, 1907.

Prof. T.
Winter.
6 June, 1907.

central institute of research?—"Unless the Board of Agriculture exercise authority; and this, I think, is to be deprecated on many grounds."

6666. Would you say on what ground?—If research work had to be carried out under the direction of the Board of Agriculture I do not think you would get as good work done as you would do if it came about in a natural way, just exactly for the same reason that I should object to direction from the Board of Agriculture in my work at Bangor. I should then tend to become a mere machine, working at the instigation of the Board, who might not always understand the exact position.

6667. It can hardly be expected that the authority of the Board of Agriculture would be exercised in such a way as to convert experts and scientific people under their control into machines?—No, I do not think it would; my experience of the Board is quite in an opposite direction.

6668. That would defeat the object of the central authority?—I quite agree.

6669. Do not you think the correlation of the results obtained by research at the various colleges and a comparison, by means of what I may call a clearing house, of the results obtained by experiment, that the action of the Board of Agriculture in that respect might be of very great value?—Very great indeed.

6670. With regard to research, are you of opinion that the teachers at the college should have more leisure for research?—Certainly.

6671. We have been told that the research should be carried out by the teachers, but that in addition, in order that research might attain its full usefulness, there ought to be a staff of persons whose sole duty was research, for what you might call the highest experiments with regard to agriculture. I suppose you would have no objection to that?—None whatever.

6672. Do you think that a travelling fellowship, or perhaps more than one, one in forestry, one in agriculture, and perhaps one in dairying, ought to be established in order to allow experts to visit the various institutions abroad?—Yes, the more the better.

6673. Do you consider that that would be of the highest practical and scientific value?—I do most certainly. At the present time few agricultural teachers in this country can travel unless they happen to have private means.

6674. I understand the University at Bangor gives the B.Sc. degree in agriculture?—Yes.

6675. Are you of opinion that the secondary education which should be given to those who will attend the courses for the Bachelor of Science degree should be of a general nature, or do you think that in special agricultural schools these students who attend the college afterwards should be prepared?—I think with regard to those who are coming for a degree, the more general information they have the better. I should like to see the education of those who are coming on for a degree to be entirely of a general character.

6676. Then you admit the need in North Wales of the institutions which are known as "winter schools," of which there are none at the present time in this country?—Yes.

6677. You give lectures and experiments, but there are no schools for those who can only frequent school until the age of 16, 17, or 18?—No.

6678. That is a large class?—Yes.

6679. Do not you consider that such institutions ought to be started for that class?—I think they would do a lot of good. We have at some centres given about 20 lectures, each of which was followed or preceded by a class at which oral instruction was given and questions asked. We have occasionally done that, and some of these classes have been fairly successful.

6680. Yes; but there is room for independent work?—Yes.

6681. Your hands are quite full as it is, and there is room for independent work in the various counties?—Quite so.

6682. You regret that those classes for elementary teachers are not continued—you have had to abandon them?—Yes; we had to abandon them some years ago.

6683. On account of want of means?—Yes; the subscriptions to the agricultural fund fell off. While we were getting £700 or £800 a year we could

afford to do work which we could not do when the subscriptions lapsed, as most of them did, at the end of the period of five years. Most of the subscribers thought that County Councils having come into existence with control of funds for such work, they were not called upon to subscribe, and so our schoolmasters' classes had to be dropped.

6684. The schoolmasters feel the want of them?—Yes, I am sure they do. The want will be more felt now than ever. Many of them did not care to attend at that time because it was not a grant-earning subject.

6685. It had no tangible result in the way of increasing salaries?—No.

6686. The dairy school at Llewenni is under the control of the College?—Yes, indirectly through the county committees.

6687. Are there any other dairy schools in connection with the College?—Not now—we had three.

6688. Why did the two others cease to exist?—They were all started by limited liability companies. In the case of Llewenni, that was taken over by the County Councils of Denbigh and Flintshire, but in the case of the other two the County Council did not take them over, and people tired of paying money. They could not be carried on at a profit, and after a time they had to be given up.

6689. The other counties have no dairy schools?—No.

6690. (By Lord Barnard.) I am a little in the dark as to the system of finance and administration of the College. I do not know whether you are in a position to give the information as to it?—Yes, I think I am.

6691. Because, you have not given us any information whatever on the subject in the long statement you have read?—No.

6692. You have concluded with an urgent appeal for the necessity of further public money, and I wonder whether you agree with me in thinking that grants of public money generally involve, at any rate, public knowledge of the system under which that money is going to be administered?—Quite so.

6693. You have not told us exactly by what body the Agricultural Department of your College is administered. Is it by a Committee?—Really, it is administered by the Agricultural Committee of the Council. The controlling body of the College is the Council, but there are several committees. The Agricultural Committee is composed of members elected by the County Council and members elected by the College; it is a big committee, and includes representatives of the agricultural community in North Wales. Half of them are elected by the College, and half by the County Council.

6694. Are the teaching staff *ex-officio* members?—Only the Principal, but, as a matter of fact, several members of the teaching staff are members.

6695. Do they meet regularly and keep minutes and have a secretary?—The College registrar is secretary of that committee. For several years now the work in the counties has almost entirely been administered by county sub-committees of this committee, and the sub-committees meet in the different counties. For instance, in Flintshire and Denbighshire, meetings are held at Rhyl; in Carnarvon, they are held alternately at Bangor and Carnarvon, and in these county sub-committees most of the county work is really done, but all the members of the county sub-committees are members of the general agricultural committee.

6696. Taking the term County Sub-Committee in the sense that there is a larger body which has delegated to them certain duties, to whom are these Sub-Committees responsible—to the County Council or to the Agricultural Committee of the College?—Half of them are elected by the County Councils and half by the College; they are joint Committees in every case but for the conduct of the work they are responsible to the College. Of course, if that work were not properly carried out, the County Councils would stop their grants.

6697. When a vacancy occurs on the staff what body sets to work to fill it up?—If it is a permanent appointment, the Council. In the case of assistants, most of whom have to be re-elected annually, the appointments are made by the Senate of the College.

6698. Who controls the finance of the Agricultural Department?—That is in the hands of the Council as the ultimate authority.

6699. The Council of the College?—Yes. They are ultimately responsible, but the finance is really controlled by the Agricultural Committee.

6700. Who really fixes the stipends of the staff?—Those were fixed originally, and there has not been much alteration since. The Council, of course, fixes the salaries of the permanent members and the Senate recommends to the Council in the case of the assistants.

6701. Supposing apparatus is wanted, or plant of some kind or another, who asks for it and whom do they ask for it?—In most cases of that kind I have got executive power.

6702. That is what I want to find out, but you probably make a report to somebody do not you?—Yes.

6703. We have had a great deal of information from all the other institutions on this question of finance, and they, most of them, have put in prospectuses and that kind of thing, but you have given us nothing?—I have got the balance-sheets and everything else here.

6704. Are your accounts audited?—Yes.

6705. Are they reported to the County Councils?—No.

6706. The County Councils are generous and give you money, and leave it to you to spend it as you like?—No; each county account is kept separate.

6707. It seems to be most elaborate?—And they have a full account of that, of course.

6708. I rather infer from something that you said that although you are very anxious to have additional pecuniary assistance from the central authority, that you are totally opposed to any further central control?—I did not wish to imply that.

6709. Assuming for the moment that this Committee were to report that the subject of higher agricultural education is a national subject and should be dealt with from the national point of view, and therefore treated as a whole, should you see anything objectionable in that?—Oh, no; but, of course, in all teaching I think you ought to give as much freedom as you possibly can.

6710. I do not for a moment suggest that there should be interference, but that the whole thing should be co-ordinated throughout the country, and that the districts should not be locked up in water-tight compartments as it were?—Quite so; I quite agree.

6711. You would agree with me that otherwise there would be a great deal of overlapping?—Quite.

6712. You would not object to rather more, I will call it, supervision on the part of the Board of Agriculture—I will not say interference?—Oh, no.

6713. Another subject with regard to finance. You have dealt with the very great difficulty you have, and you have also drawn attention to the fact that the whole question of this form of instruction has only recently been brought into public notoriety. Do not you think it is possible that in the case of agricultural instruction, the same thing may happen as has happened all over England and Wales, that private munificence will, to a certain extent, assist?—I think so, to a certain extent, perhaps.

6714. There is a spot quite close to you where a sum of £26,000 has been provided privately—are you aware of that?—Yes, I am quite aware of that.

6715. Then again in Newcastle, Mr. Dagleish has also died and left a very large sum of money, not entirely for the benefit of the Agricultural Department, but in which the Agricultural Department participates?—Yes, I have heard about that.

6716. You would agree that it is possible the same thing might happen in your case?—It is possible, but we are wanting a large fund of £150,000 to erect new college buildings, and until we get that we are not likely to get bequests for other purposes.

6717. England has taken many years to build up, you know, and things cannot be done all in a day?—The Agricultural Department, I do not think, has ever had any legacies. The College has had legacies, and of course, it may happen that in time that the Agricultural Department will have legacies too.

6718. The whole matter is at present in the course of development; you cannot regard the present state as final?—No.

6719. Or that anything that we might decide now would necessarily hold good in a few years' time?—No.

6720. A good deal has been done in the way of progress, perhaps more by your college than any other?—Yes.

6721. With regard to the question of store cattle, to which you alluded, when I was a lad I remember that an enormous number of young store cattle from Wales used to be sent up to Market Harborough, and they were considered very useful, and also in Northamptonshire. The farmers there, perhaps, do not call themselves farmers, but graziers. Is not that trade still being carried on?—I do not think the trade is so large as it used to be, the competition has got very much keener—particularly from Ireland.

6722. You think it would be well to keep up that trade?—Certainly.

6723. I do not think you have told us what fees the students pay?—Like all Welsh colleges, the fees are low. For the short course the fees at Bangor are £5 15s. 6d. In the case of an ordinary student the fees for a year vary from perhaps about 15 guineas to, say, perhaps 22 guineas, or something like that. Those taking the longer courses pay from about 15 guineas to 21 or 22 guineas a year—that is according to the number of laboratories they take.

6724. What would a year's board and lodging cost him at Bangor?—Many of the students live three or four together, and they can live much cheaper in that way. Rooms do not cost much in Bangor, but altogether, I should say, including fees, from about £30 to £45 a year. The student could live well for £45 a year; the cost of living is low.

6725. You told us that some of your students come at an advanced age—some of them over 20?—The short-course students.

6726. That does not apply to the long-course students?—Not so much.

6727. At what age do they come generally?—17 or 18 up to 20. I like the older students.

6728. We have had evidence from two or three witnesses which differs on that point. Some prefer that a lad should come from a good secondary school, having received a good education there, and other gentlemen are of opinion that it is desirable that on leaving the school the lad should have practical work on a farm first. I rather gather that is your view?—I was thinking about that. As a lad gets older he becomes a much more serious person and makes a better student. I have had good students who have come direct from school, but the general rule is that when a student comes who is over 20, in spite of what he has forgotten he does well, and is an earnest, hard-working student.

6729. With regard to forestry, you told us that part of the duties of the Lecturer in Forestry is to visit local woods and that sort of thing. I wonder if your experience will be the same as ours in Newcastle that that has rather fallen off. The people in the locality took to it rather at first, but the instructor in forestry has been in much less demand latterly?—I do not think I can say that is the same with us. I think it will be increased.

6730. I understood you to say that nothing had been done?—That was ten years ago I was speaking of.

6731. I think a good deal has been done by the Departmental Committee that inquired into the subject?—Yes, but we got no grant. We suggested at that time that the Government might do something with the Crown Lands in Wales, and that we should get a man who might really work the two.

6732. I do not know whether you would like to suggest any particular reasons that this Committee should give, if they recommended that a further grant was necessary from the Government—any reasons which would differentiate agriculture from other industries—because the House of Commons, who are guardians of the public purse, cannot distribute the public money simply because they are asked for it. Is there any special ground that you can put forward?—I have not thought of it in that connection.

6733. That is the position in which it strikes me, that if we are to recommend increased grants we shall have to give some special reasons for it. Of course we must bear in mind that any money which is granted comes from the taxpayers of the country. It is not as if the Government had a treasure box?—Yes; but it is a national question, and it is quite clear to everybody that the Government is at present really only playing with the question, the amount given is too trivial.

*Prof. T.
Winter*

6 June, 1907.

Prof. T.
Winter.
6 June, 1907.

6734. As you and Mr. Pennant have told us, if money were granted it would enable colleges like yours not only to grant increased facilities in the way of education for students, but it would provide assistance also to the country generally?—Yes.

6735. (By Lord Moreton.) Can you tell us what opportunities your pupils have of going about and seeing the practical work of forestry?—The only opportunities they have now is in going out on excursions to the woods in the neighbourhood. We happen to be well situated at Bangor in that respect. There are two or three large estates there, and the students have permission to visit them. We do not consider that it is very satisfactory however, and that is why we should like to develop it.

6736. I understand you have an experimental plot of ground, but what I wanted to get at was what chance would they have of seeing old wood—wood which had been or was going to be cut down?—Yes, there is a good deal of that seen, for instance, on the estate which adjoins the college.

6737. You do not get much hard wood there?—No, we are not in a hard wood country; you would have to go further away into Montgomeryshire, and parts of Denbighshire, but of course it could be done by means of excursions.

6738. As regards the labourers who work on your farm, have you ever done anything to encourage or teach the young men and give them a lift up?—We do not employ any young men at all; I have no boys.

6739. You have never thought that it might benefit a certain number of the labouring classes to qualify them as labourers or shepherds at your farm?—Yes, and I should be glad to do it, but we have to pay rent and taxes—nearly £600 a year, and we get no county grants at all for the farm. We have only got the Government grant of £200, and our labour bill amounts to about £800 a year.

6740. Lord Barnard asked you a question about Welsh cattle. I imagine the object of your farm is to teach your pupils what are the best cattle to keep in North Wales. I presume you consider the black Welsh cattle are the best?—For a great part of it; for the greater part of North Wales. I think the Welsh cattle are the best and they are the cattle of the country.

6741. Quite so, but do you have any other cattle?—Very rarely. I have others occasionally, but I do not consider it is any use to have a specimen of this breed and a specimen of that. I do not think that is of any value to the students. They had better go to a Royal Show or something of the kind, and they can there see an exhibition of the various kinds of cattle.

6742. Of late years black Welsh cattle have gone down in the estimation of the British farmer a good deal, have not they?—I should not say so; if you look at the records of the Smithfield Show.

6743. I am not talking of special animals, I am talking of the breed *qua* breed?—There is room for improvement.

6744. As regards your sheep I suppose you specialise from the local breeds there also?—Yes, Welsh sheep chiefly.

6745. In fact, in all the stock, I suppose?—Yes, we keep at the farm Welsh cattle, Welsh sheep, and Shire horses; we have not done anything with ponies.

6746. Pigs?—At the present time we have not got any pigs.

6747. Have you sent any pupils up at any time for the National Diploma?—No, we have not for years had a pupil who has gone up. I have never encouraged them to do that; what I do encourage them to do, if they can stay long enough at the college, is to go for a degree.

6748. You consider a degree is the best?—Yes.

6749. I do not know whether you are aware that Aberystwyth has from time to time sent their pupils up for the National Diploma?—Yes, they have taken the other line; their pupils have gone up more for the National Diploma, and not so much for the degree.

6750. They can take a University degree if they choose?—Yes.

6751. Your pupils can go up for the National Diploma if they wish to do so?—Yes, but we have a certain number every year who go in for the degree.

6752. (By the Chairman.) I just want to make that matter of the committees quite clear. The Agricultural Committee is I understand a committee of the Council?—A committee appointed by the Council.

6753. It is a sub-committee?—No, it is not a sub-committee of the Council; it is a committee appointed by the Council.

6754. Half of the members of that committee are appointed by the Council, and half of them are appointed by the County Council?—Yes.

6755. Then the county committees again are appointed by the Agricultural Committee?—Yes.

6756. Half of them are appointed by the Agricultural Committee but they are not necessarily members of that Agricultural Committee?—Not necessarily.

6757. The other half are the County Council members of the Agricultural Committee?—Yes.

6758. They report to the Agricultural Committee?—Yes.

6759. (By Mr. Medd.) In answer to Lord Barnard, you referred to the paltry grants for agricultural education. You are aware that £100,000 a year is spent now on agricultural education?—In what way?

6760. In various ways of course, but I mean by the central and the various local authorities?—Yes, it would be in that way, but not the Government grants.

6761. By the central and local authorities?—I do not know the exact sum.

6762. Very nearly £100,000, which is quite a considerable sum?—Yes.

6763. You will agree with me that if we are to get them increased we must prove that there is no waste, that the money is expended to the best possible advantage, and that we do not allow any gaps to remain?—Quite so.

6764. In answer to Lord Reay you said you entirely approve of the idea of an intermediate school independent of your institution at Bangor?—Yes.

6765. That school I take it would be part of the scheme under your direction. I think the school was suggested at St. Asaph?—It was Mr. Pennant who suggested that.

6766. Of course Mr. Pennant's evidence is over, but it was St. Asaph, I believe. Can you give me any idea of the type of school you would establish?—I think you misunderstood me; I did not say I would establish them.

6767. In answer to Lord Reay you said you quite approved of an intermediate school of that grade of agricultural education?—No; I do not think I did say that.

6768. I think so, and you used the word "independent." I only wanted to get you to agree with me that it would form part of your own organisation, only it would be situated in a different locality?—I was asked by Lord Reay with regard to the character of education that I thought suitable for the students coming on to us to take degrees, and I said in reply to that that the more general education they had the better.

6769. Then Lord Reay mentioned about the grade of agricultural education for those who could not come to you and who must finish all their education at 15 or 16, and you agreed with him that a permanent institution to provide such instruction for them was desirable independent of you?—Exactly.

6770. By using the word "independent" you do not imply that it should have no connection with you, but that it would simply be in a different locality and form part of your general organisation?—Yes.

6771. That brings me back to the original point of how we are to prove the need for more money, that you, as a collegiate centre, should make yourself responsible for every grade and type of agricultural education within that area?—Yes, that would be my view.

6772. Can you, Mr. Pennant, kindly give the Committee at some future time a copy of the scheme for this school at St. Asaph?

(Mr. Pennant.) Yes, I think I can do so, but it was entirely the County Councils of Flintshire and Denbighshire that were taking up this question. The intention would have been to have made this a school under the General Welsh Intermediate Act, but devoted to agriculture more particularly for the Counties of Flintshire and Denbighshire. Any extra expense in connection with it would have come from those two County Councils.

Prof. T.
Winter.
6 June, 1907.

6773. Of course, the scheme is entirely provisional at present.

(Mr. Pennant.) You mean the suggested scheme?

6774. Yes.

(Mr. Pennant.) Yes.

6775. It would be of great assistance to this committee I am sure if we had an idea of the type and grade of school you propose to establish?

(Mr. Pennant.) I think I can find you that information.

6776. Thank you very much. (Mr. Pennant subsequently forwarded copies of the draft and amended scheme of re-organisation of St. Asaph Intermediate School.)

6776A. (To the Witness): In regard to the scholarships, have you scholarships for each of these courses: the degree course, the diploma course and the short course?—Most of the short-course students come to us with exhibitions given by the County Councils.

6777. Have you scholarships for the degree course?—We have a few confined scholarships, that is confined to agricultural students of the college; but most of the College scholarships are open to agricultural students; the college gives a number of scholarships varying in amount from about £40 to £10 a year; those are open.

6778. Is no examination held for these scholarships?—There is no examination held for the short-course exhibitions, but for all the other scholarships there is; and unless we get suitable candidates, the scholarship is not awarded.

6779. The exhibitions in the short course cover the cost of tuition and maintenance, I suppose?—They are very small, varying in amount from about £12 or £14—£14 is the highest for the short course.

6780. What would a student have to pay out of his own pocket?—He pays £5 15s. 6d., in fees; and he has got to pay for board and residence for 11 weeks. The short-course students all live in the neighbourhood of the farm. On three days of the week they go to the farm, and on the three remaining days they go to the College at Bangor.

6781. Are they as a rule young farmers?—Yes.

6782. What education have they had generally speaking before they come to you?—From the elementary schools mostly, but we are now getting some from the intermediate schools.

6783. You spoke, in answer to Lord Reay, of the defective preparation of some of your students. From what class do those students come?—I said that many of our students were men from 20 years of age to 30, and sometimes I have had them as old as 36; and they probably have had very little education.

6784. Are those who come to you from schools sufficiently prepared?—Very much better prepared than those I have just mentioned.

6785. They would be, I suppose, from the intermediate schools?—They nearly all come from the intermediate schools.

6786. Do you find any difficulty in regard to the arithmetic or composition of the students who come to you from the elementary schools after a lapse of two or three years?—Yes.

6787. Of course that handicaps your work?—Yes; and many of them, of course, habitually speak Welsh when they are at home. Some of them perhaps do not know very much English; in a number of cases their English is defective.

6788. You must lose a considerable time in overcoming those difficulties?—You have to give a good deal of time to them, but as a class they are most excellent students.

6789. I notice you have a year's course for students who have already completed a two years' course in the day training department who propose to become teachers in rural schools. What are the conditions in that course?—It is intended for those students who have already had the two years' training in the day training department, those who have come back for a third year. We started that course some years ago, but as a matter of fact very few students have taken it. Those students have had their ordinary training, and have generally taken chemistry and botany to a certain stage, and our course really picks up the work where they have left off before. They receive considerable training in chemistry as applied to agriculture, and continue their course in botany and applied botany, and take subjects like book-keeping and entomology. I have the exact scheme here if you would care to see it.

6790. Perhaps you would put in the curriculum?—Yes, and they take the courses in agriculture. Perhaps I may explain here that I do not want to have agriculture taught in the elementary schools, but these teachers, if they have a fair knowledge of it, would be much better able to teach the applications of chemistry and botany to agriculture.

6791. Yes, and they can use natural and physical phenomena as a sort of basis for ordinary class lessons?—Yes, quite so. I met a student a few days ago who had been through this course, and is now the head master of an elementary school of nearly 200 children. He said it had been of very great value to him. I happened to meet him the day before I came up here, and I asked him the question.

6792. Is this third year to follow immediately after a two years' course, or does it come after an interval?—Immediately after.

6793. How many have you had?—I think only four, altogether—usually we have not got anybody.

6794. You alluded to the difficulty in regard to the acting teacher and his not receiving any additional salary?—Yes.

6795. What would you suggest as an adequate increase of salary if he gives up his time? What should you think in addition to his ordinary salary the teacher would be worth?—I think in time things will be done quite differently. In Merionethshire, for instance, they have actually made a start; they want to re-model their schools, and have had a conference with the Education Department on the subject.

6796. Have you formed any idea as to what would be a fair sum to offer a teacher who took the trouble to become qualified in addition to his ordinary salary?—No, I have not looked at it in that way, but what I should like to see is that the rate of salary of the town and country teachers should be the same; as it is they all want to get to the towns.

6797. If they would consent to be State paid, that could be overcome. Has it been suggested to you that you might have a third years' special course for certificated trained teachers to be taken after the lapse of say four years from the period of original training?—No, not to me.

6798. Of course, the whole organisation of your education in Wales comes under the Welsh Department?—Yes.

6799. The Board of Education in England have agreed to a proposal of that kind. Possibly you might suggest that to your department—a special third years' course for certificated rural teachers at an agricultural institution such as yours?—Yes; I think that could be managed.

6800. You spoke of the amount of literature which you circulate. What steps do you take to distribute it; how is it distributed?—The reports?

6801. Yes, the bulletins you referred to?—Just in the way of leaflets.

6802. Have you any effective method of distributing them?—Yes, it is pretty effective I think. We have a large free list; we write to the secretary of every Parish Council in North Wales and send him copies of the leaflets and ask him how many copies he would like for distribution in his area, and the County Councils the same. In addition, all members of our Committee and all past students, all secretaries of extension lectures and those who are carrying on an agricultural experiment, receive copies of them.

6803. They are very widely distributed?—Very widely. I do not suppose you can go to any hamlet in North Wales where you will not find our reports.

6804. Do you come in contact with the official Correspondents of the Board of Agriculture at all?—Yes, the local ones; I probably know them all.

6805. Are they of any assistance to you in the work of your agricultural department?—I cannot say that they have been, but I think probably most of them are members of our Committee.

6806. Perhaps you would agree with me in thinking that if a strong influential consultative committee in London, composed of representatives from the different counties in England and Wales, and were appointed and met periodically to confer upon questions of agriculture and agricultural education, and to bring pressure upon the Board of Agriculture and

Prof. T.
Winter.
6 June, 1907.

the Treasury, it would be a more effective system than that of the isolated correspondents?—Yes, I think it might.

6807. You said that you were not able to arrange at present for your teachers or members of your staff to undertake foreign tours?—We are not.

6808. You are aware that in Essex especially the County Council has arranged these foreign tours for farmers?—Yes.

6809. Could not something of the same kind be arranged in North Wales?—The County Councils are very hard pressed for money; they have had to support their intermediate schools. That difficulty has of course not been felt in England yet to the same extent as we feel it in Wales.

6810. You must remember you get more money in Wales from the Exchequer than we do in England. You are much better off really. The Exchequer gives you one penny to every penny you raise locally; it does not give us that. Still, I only make the suggestion that something might be done in that way. You mentioned the agricultural co-operative societies?—Yes.

6811. They have been developing in Wales?—Yes.

6812. Do you find as agricultural co-operation develops it creates a demand for agricultural education?—They are only at present in their infancy. There has not been time to judge yet. If I had not come up here, I was going to address a meeting of the Anglesey Co-operative Society this afternoon.

6813. Your educational efforts have tended to some extent to increase the demand for co-operation?—Undoubtedly, but it has been slow. Nearly ten years ago when the British Dairy Farmers' Association came to North Wales I was local secretary, and I arranged then that one of the subjects for discussion should be on co-operation. It created a little interest then. I got Professor Long to come down and give an address on the subject at Bangor sometime afterwards. That created some interest at the time, but progress was slow. Latterly, however, it has been more rapidly, and we are now giving quite a number of lectures all over North Wales on the subject.

6814. Are they mainly with reference to co-operative production or co-operative distribution—rather in the purchase of manures and so on than with regard to sales of produce?—Yes, chiefly as to purchase, but there is no reason why co-operative distribution should not develop; of course, purchase is much easier.

6815. You probably think the Board of Agriculture and the Treasury would be justified in supplying funds to encourage the formation of co-operative societies?—To what extent?

6816. That is indeterminate at present?—In what direction then?

6817. By propaganda?—I think it would be very desirable.

6818. The point has been acutely debated in Ireland and referred to in England, and in the Small Holdings Bill there is a suggestion of the same kind?—Yes.

6819. You think the Government would be justified in supplying funds for the promotion of co-operative agricultural societies?—Undoubtedly; but I think it is a thing which would require to be carefully dealt with, of course.

6820. I do not mean for the promotion of their trade.—Oh, no.

6821. (*By Professor Middleton.*) How many students have you usually attending your short courses?—They vary from about 15 to, I think, as many as 25.

6822. What is about the ordinary age at which they come to you?—We do not take students unless they are over 16, but I do not like to have a student at that age.

6823. I wanted to ask you what age you would like your short-course students to be—what is the best age for your short-course students?—I do not like them to be so long away from school that they have forgotten what they learnt there. I like them from, say, 18 to 20.

6824. You like them to have a considerable knowledge of farming before they come to you?—I do, certainly.

6825. In spite of the fact that these students have an indifferent preliminary education and have left school for some years, you find them to be the most satisfactory class of student you have to deal with?—Yes. I

was going to give the case of a man who has just been appointed lecturer in agricultural chemistry at Aberystwyth. He came to us as a student almost without preparation, and he left after taking first-class honours in his University degree. He held for a time a most important appointment in Lancashire, and is now lecturer in agricultural chemistry at Aberystwyth.

6826. Nearly all the short-course students go back to the land, do they?—Practically all.

6827. What is the reason of the satisfactory character of the short-course students; is not it his keenness to learn?—Certainly.

6828. You find that every short-course student is anxious to learn?—Almost every one. The ordinary students live in Bangor. The Principal is the person in charge, and questions of discipline has to be dealt with by him, but these students live in the neighbourhood of the farm where I reside, so that I have practically the same control over them as the Principal exercises over the students at Bangor, and in a period extending now over ten years I have scarcely ever had a fault to find with a short-course student. Some of them come back to us to take longer courses.

6829. The real reason for their satisfactory character, is that they are very anxious to gain information?—Yes.

6830. And as a matter of fact they do gain a very great deal of information?—Yes.

6831. When these students go back to their farm how do they compare as a rule with a man who has been through the longer course. Take, as a type, a Welsh farmer who has been through your longer course and a Welsh farmer who has been through your short course?—We have fewer who have been through the longer course; a lot of the men who have been through the longer course take better positions elsewhere.

6832. I suppose the short course exercises more direct influence on farming than the longer course?—Yes, perhaps it does. It is difficult to compare the two. There are more of these short-course men who go back to farming. It involves a considerable sacrifice to send a man to college; and after spending two or three years at college they think they would like to find something more lucrative than farming, and many of them do.

6833. Have many of your short-course students been to the evening continuation schools of the County Councils?—Very few.

6834. Some reference has been made to the establishment of winter schools as a means of continuing the education of boys who have left the elementary school. From your knowledge of North Wales would you think would be likely to affect agriculture to the greatest extent—the winter school or the short course. Perhaps you have not had time to think over that?—It all depends how you conduct the winter school. I should like to have an increase in the number of short-course students.

6835. In a winter school I gather you do not intend to teach practical agriculture; it is to be a general course on the subjects which bear upon agriculture?—You could not in many cases teach the subjects as well as they do at the colleges. If they go to the college they have laboratories at hand which you could not have at the winter schools in many of the districts.

6836. Would you prefer a development of the short-course system or of the winter school system. Which do you think would be most likely to be of advantage?—I do not think I should care to choose between the two. I do not see why they should not both be developed. I think it would a great deal depend upon circumstances, but I know the good that the short course does. The other of course I have not had experience of, but I have no doubt whatever they would do a great deal of good.

6837. Coming to your farm, how do you use it for the purpose of teaching. In the case of a short-course student you take him there three days a week?—Yes.

6838. How do the long-course students do?—They come there practically every week, sometimes twice; but with the amount of work they have got to do at the College they have not much time for that sort of thing.

6839. What happens, I suppose, is that you take them over the farm and explain what is being done?—Yes.

6840. The college student, I suppose, does not do any

of the practical work during term?—No, not the ordinary student; the short-course students do a little.

6841. You expressed the opinion that Government ought to give you grants in aid of stockbreeding. On what grounds would you base a claim for that aid? The only instance we have got in this country is the Royal Commission on Horse Breeding, which gives premiums for the breeding of horses.

6842. Your argument is, is it not, that the number of breeders of pure-bred Welsh cattle is not sufficient for the requirements of the country?—I do not argue in favour of any particular breed.

6843. I understood your argument to be that the Welsh cattle-breeding was suffering because of the small number of good animals that was being produced?—Oh, dear, no. I have seen a map at the Board of Agriculture which shows the number of cattle kept in certain areas and in Anglesey, I believe, there are more animals than in any other county of the same area.

6844. Yes, per acre; but I understood you to say you were in need of more animals for breeding purposes?—What I say is this, it would be a very good thing for Wales, and I am speaking of Wales more particularly, if the same assistance were given towards stock breeding as is given in Ireland. I did not say for Wales alone, of course, I am not making any plea of that sort.

6845. Taking your farm for example as a farm where pure-bred stock is produced, I do not personally quite see how one could give a grant to that institution and refuse to make a grant to some person who was, perhaps, breeding better stock in the same neighbourhood?—I merely say an institution like ours might render very useful help.

6846. It can only do so if the number of pure-bred stock is insufficient for the requirements of the country. That is the case in Ireland, at least the Irish Government holds that the number of pure-bred stock in the country is insufficient for the requirements?—Of course the effect of what they are doing in Ireland is this, that instead of using the ordinary bulls they have in Ireland they are taking into the country very large numbers every year of animals from England.

6847. They are grading up?—Yes, animals they buy in this country at prices varying from £25 to £50 or £60 a head.

6848. My point is, do you feel you require to be graded up in that way in Wales. Is the supply of first-rate well-bred cattle for stud purposes for the local requirements sufficient?—I think it is not, and that does not apply to North Wales only.

6849. (*By Lord Moreton.*) Would you restrict it to Welsh breeding?—No, I would not restrict it to any breed.

6850. (*By Professor Middleton.*) My difficulty is this, that if a grant were to be made to you in respect of the pure bred stock which you breed on your farm at Bangor the same claim could be put forward by some other breeder in your neighbourhood, I should suppose, and that would really mean subsidising the stock breeding industry?—Well, I do not see why you should not.

6851. Then you admit that if we were to give grants to you we should have to subsidise the stock breeding industry?—Yes, I believe in subsidising the whole stock breeding industry. I am not asking merely for a grant for ourselves at all; I think the benefit to the country generally would be very great. We are suffering, and we will suffer more, on account of the subsidised cattle which come from Ireland.

6852. You mentioned the fact that when you first started the farm your initial heavy expense was the interest on overdrafts. Have you now sufficient capital?—We have a little overdraft, but I try to keep that down as far as possible.

6853. That difficulty has largely disappeared?—Yes. Last year, for several months, I had not an overdraft at all from the bank. When we first started it was all overdraft. We got a little money in before the end of the first year. We had collected about £4,000 at the end of the second year, but we have always had an overdraft; fortunately it has been getting steadily less, and is not now a great burden. We have generally been paying interest at the rate of five, and sometimes six per cent.

6854. May we take it that you are now running the

farm at a cost to you of £200—the amount of the grant you get?—We get a little from the students' fees. Practically the entire management of the farm is in my hands. We have got a committee, but they do not interfere much, and I have got to see that we do make things meet, because we have no fund on which we can fall back.

6855. That is what I wanted to get at? You are able to make ends meet with this £200 a year?—Yes but you must remember our work is limited—we have made ends meet, in fact I think we have probably done a little more because our bank overdraft has largely disappeared, and I think our capital as represented by our stock is probably worth more now than it ever was.

6856. I suppose you have an annual valuation of stock?—Yes, every November.

6857. (*By Mr. Davies.*) Has the capital which went to pay for the stock been contributed from private sources?—Yes, except that the Anglesey County Council gave us £100. With that exception, it is all private subscription. The overdraft disappeared as the subscriptions were paid in; but after all the subscriptions, the £4,000 we raised, had been paid, our stock at the commencement cost us £4,700, so that we had to begin with a considerable overdraft.

6858. It has disappeared little by little out of the profits you have made from the farm each year?—Yes; it has mostly disappeared now.

6859. To go back to the stock question for a minute, I gather your idea is that there should be some sort of allocation of grants in the same way as is rather done in the case of horse breeding—that there should be awards and premiums given in different parts of the country. That is the sort of system you would like to see?—Yes, something of that kind to encourage stock breeding. I suppose really the Government has in view remounts for the army in making the grants for horse breeding, but I do not see why the same thing should not be done in respect to cattle breeding; it would improve generally the cattle of the country to an enormous extent.

6860. I see in the report which has been issued by the Board of Agriculture that your staff consists of about nine persons altogether, including yourself?—I suppose there would be about that number, but those are appointed for agriculture alone. I have got two assistant lecturers; then there is the lecturer in agricultural chemistry, and the lecturer on forestry, and outside lecturers who take special subjects, like veterinary hygiene, and things of that kind. Of course, we utilise several members of the ordinary staff of the college for botany, and chemistry, and that sort of thing.

6861. Of the students attending the courses of instruction at the College during the past Session there was one in his fourth year, four in their third year, one in his second year, and one in his first year. For the diploma course there were four students in their second year and six in their first year. For the special courses there were three students and thirteen for the short courses for farmers' sons, and three students who attended the autumn and spring terms—altogether, sixteen in the short course?—Yes.

6862. So that altogether there are only about 37 students in the college?—Who were there for agriculture alone, yes.

6863. How are the staff employed when the short course comes to an end during the summer months. I mean to say that when the short course comes to an end there would only be about 10 students left in the college?—My assistants do not do very much of the in-college work. Most of the in-college work, lecturing on agriculture is done by me, and I also arrange the work and supervise it in all the different counties. The lecturers during the winter months give lectures and in the summer there are the experiments.

6864. So that the staff is fully occupied from one year's end to the other?—Well, we always try to let the assistants have two months' holiday clear. For myself I have not had a months' clear holiday for ten years, not since I have had the control of the farm.

6865. In your opinion is not the number of the students at the college far less than it really should be. You would expect a far greater number of students in proportion to the staff, would you not?—Yes, we could deal with a considerably larger number.

6866. Double?—Yes.

Prof. T.
Winter.
—
6 June, 1907.

Prof. T.
Winter.
6 June, 1907.

6867. For what reason or reasons is the number of students so small?—I have no doubt that in the near future the number will increase. It used to be a very difficult matter to get students. I am sure in my early days in connection with the college more than three-fourths of the students I had to get by canvassing, and that with some difficulty, but now they come willingly.

6868. Do you think the methods adopted by the County Councils in giving scholarships has anything to do with it; I refer to the fact that each county council in awarding a scholarship has no examination, and very often it is a question of influence, and the large farmer who can perfectly well afford to pay for his son to go to college is able to get a scholarship for his son, and the small farmers complain that whereas the large farmers who can afford to pay get scholarships for their sons, consequently the small farmers interest in the college diminishes?—I should not say their interest in the college diminishes, but there is something I think in that.

6869. They make no sacrifice to send their sons?—Of course if you give too many scholarships people do not appreciate the instruction sufficiently. There is always that danger in giving scholarships, but now the cost of education is coming more and more on the rates everywhere.

6870. Could you not devise some scheme to contribute the money awarded in scholarships to a common fund, and then allow representatives from each county and the college to distribute those scholarships after examination as they thought best. Do you think that would be a good thing. I understand now that the County Councils are quite prepared to give scholarships for students who go up for the short course, but they are not prepared to give scholarships for the advanced work so that your best students could go on from the short course to the diploma and to the degree course afterwards?—The County Council of Carnarvonshire do give scholarships for longer courses. We have these students for two years, and they always take the diploma or degree. We have also now a £50 scholarship from the Surveyors' Institution and a £30 scholarship given by Colonel Platt, but those are for long courses. The students must stay at the college for not less than two years. I should like to see more.

6871. Do you think it would be a great advantage if there were a committee of that sort to allocate the scholarships and hold an examination of the candidates?—When you get a number of applicants you must examine them, but up to the present the number of applicants has not been very great. Last year we had twice as many applicants for short-course scholarships as we have ever had before. When we first started there never was any competition for the scholarships, now the competition has been increasing year by year, and the plan the County Committees have adopted is to strike out the younger ones, but no examination has been held yet for these short-course scholarships. We will have to have a new plan as competition increases.

6872. Do not you think, in order to get hold of the young men it would be a good thing to have some sort of evening classes, or winter schools in the different counties so that you would be able to get at the young men and give them a short course there preparatory to the examination for the scholarships?—Anything in the way of a winter school would help very greatly.

6873. Could not you have it in the intermediate school by making the intermediate school the headquarters?—Yes, but then, you know, it would be difficult to get the pupils there. As it is now, the pupils have to come by train a good many miles to the county schools, and in the evenings the facilities for coming by train are not so great, and the county school area would probably not be the best area for them.

6874. But you think those winter schools would be practicable?—Yes.

6875. Supposing you had an increased grant, would you endeavour to have a lecturer for each county, a man who was on the college staff and responsible for the work carried on by the college in each county, that is each county affiliated to the college?—I do not know that we could arrange it in that way, but it might, of course, resolve itself into that.

6876. We hear a good deal about rural depopulation in these days. I suppose that still goes on in the purely agricultural counties which are attached to the college?—Yes, I think so.

6877. Do you think it would be a good thing, supposing a lecturer were appointed in each county who was responsible for each county, that they should also enquire into the economic problems in these counties in order to try and stimulate agriculture in the particular areas for which they were responsible?—I think there is no particular reason if you had the right men why that should not be done.

6878. I suppose the agricultural problems which you are engaged in trying to solve are much the same as those the staff at Aberystwyth have been engaged upon?—Yes, but perhaps we get a greater variety in North Wales than they do. We have all that part of Denbigh round the Wrexham country down into the Severn Valley. I suppose there is no part of the United Kingdom where there is more variety than in North Wales.

6879. Do you think it would be advisable to have more co-operation between the two departments at Aberystwyth and Bangor in the way of comparing notes, and arriving at some common plan of campaign so as to avoid overlapping as far as possible?—Yes, I think something might be done, not only at Aberystwyth and Bangor but at all the colleges. There is some danger of overlapping, but I should not like to say there actually is any now. With regard to experiments the great thing is demonstration, and to keep pegging away year after year. Somebody mentioned charlock spraying this morning. I may say that we have been spraying for the last 10 or 12 years in every quarter in North Wales and it is only within the last two or three years that the work is beginning to bear fruit and that farmers are beginning to spray for themselves. On that point I have a letter which came to me only this week from a lecturer in agriculture appointed by the Glamorgan-shire County Council. He says: "Your leaflet No. 4 on spraying charlock I find influences farmers here to give spraying a trial." That is one result of the distribution of these leaflets. That is many miles away from us. I have had inquiries from all over the country, and I think it is largely due to the fact that we distribute our reports in the form of leaflets. The number of inquiries on this and other subjects is increasing every year.

6880. With regard to the forestry department, most of the work of your lecturer is outside the college, is it not?—Yes, we have one in-college course of 100 lectures, but the principal part of his work is advisory.

6881. The advice is paid for?—Yes—particularly down in your own county of Montgomeryshire.

6882. If that part of the work increases will this particular department of the work become relegated to the college?—I do not think that is likely, but as a matter of fact if we had money we would spend it in developing the department. At the present time the fees for advisory work amount to £50 or £60 a year, but I have no doubt whatever that they will increase. Some of the largest estate owners in Wales are now acting entirely on the advice of our lecturer in forestry, and I have no doubt that still more will do so. When we started the forestry department we anticipated that giving advice to landowners would eventually be one of the most valuable parts of the work.

6883. If it was extended no doubt the fees would pay for it?—I do not know that you could get people to pay very large fees. The lecturer would go for two guineas a day and expenses.

6884. Have you done anything with reference to your old pupils. Have you got an association for keeping in touch with them, or any machinery for keeping them together after they leave you?—We have not an association.

6885. Some of the other colleges have?—Yes.

6886. Do you think that would be a good thing?—I think it would, but we are pretty much in touch with them, and large numbers of them come to the farm every year. We are constantly writing and sending them things, but we have not an association that brings them all together. I think an association would be a good thing.

6887. (Lord Moreton.) There was one point I was not quite clear about. You were talking about the clearing off of the overdraft on the farm. Is there a separate farm account at the bank, or is it the agricultural department account?—No, it is a separate account; we have a separate agricultural account too.

6879a

6888. It is a wheel within a wheel?—Yes. No money from the ordinary agricultural account goes to the farm, the farm has got to pay its own way.

6889. (*By Professor Middleton.*) In reply to one of Mr. Davies' questions you referred to the fact that there might possibly be overlapping of work in colleges. Have you yourself ever come across any case of overlapping?—No, I cannot say that I have.

6890. Have you heard of anyone else who has come across it?—No, but people say there might be; one often hears it mentioned.

6891. You have never personally come across a case?—No, I cannot say that I have.

6892. (*By Mr. Davies.*) Do you carry on any analysis work in the College?—Do you mean for individuals?

6893. Yes.—No, we do not, but I think in the course of the next year our agricultural chemist will probably be appointed analyst for the different counties.

6894. He has not been so up to the present?—No, not that there will be so very much done, because farmers do not send many samples in.

6895. (*By the Chairman.*) Is there a separate committee for the farm?—There was a farm committee which met periodically, but that committee has now been dissolved.

6896. You reside on the farm?—I reside on the farm.

6897. You are responsible, but the Agricultural Committee supervises the farm?—Exactly.

6898. As it does the Agricultural Department?—Yes.

6899. Would you be in favour of the Board of Agriculture having a staff of expert gentlemen who could be sent for throughout the country in case of the outbreak of an epidemic or any matter of that description which required investigation. We have been given instances of calamities of that kind having occurred, and we were told that the college that was near could not spare their best men for investigations of that kind. Has that come under your notice in North Wales?—There are the Board of Agriculture inspectors.

6900. I am not talking of the Board of Agriculture inspectors, I am talking of experts who would be able to do research work on the spot, and who would have time at their disposal in which to do that work. The duty of the Board of Agriculture inspectors, of course, is to inspect educational institutions, and they have no time for such work as I have mentioned?—Quite so.

6901. The men who I suggest would be high class experts?—Epidemics could not, of course, be dealt with by a college; they would have to be dealt with by people appointed by the Board of Agriculture.

6902. You think there would be scope for a staff of that kind, organised on a central basis, which would be available throughout the country for any emergency and urgency work of that kind?—Of course, that would apply largely to animals, would not it?

6903. Quite so, and diseases of plants and trees, for instance?—In cases like that, if we had the necessary funds and the necessary staff we should probably be better able to deal with them than the Board, or at least quite as well.

6904. I merely mean that the staff at all the colleges—it applies almost to all of them—is overworked as it is?—They have not time—certainly with us they would not have any time for such work.

6905. Therefore in case an emergency of the kind arose there ought to be some provision made, and it could only be made of course by a central agency, and it is clearly incumbent on the Board of Agriculture and on the Treasury to provide means for such?—Yes. The colleges at present are really unable to take that up.

6906. (*By Professor Middleton.*) We have at the Board of Agriculture a highly expert veterinary staff who deal with outbreaks of disease in animals?—Yes, that I was aware of, and for several years I have been repeatedly brought in contact with them. I might say that I think that staff might work more perhaps in connection with the colleges than it does at present—I frequently hear of inspectors coming down from the Board for various purposes, but many of them never come near us, although our local knowledge would frequently enable us to give them real assistance.

Prof. T. Winter.
6 June, 1907.

Mr. THOMAS HACKING called and examined.

6907. (*By the Chairman.*) You are the Principal of the Countess of Warwick's School, Bigod's Hall, Dunmow?—Yes.

6908. Will you tell the Committee how the School came into existence?—In the year 1897 the Countess of Warwick became deeply impressed with the idea that something should be done in the way of educating those who would eventually be engaged in rural occupations. The critical state of agriculture clearly showed the need of an attempt to infuse into agriculture something of the spirit which animates the industrial centres—to blend practice with science. Her ladyship firmly believed that much could be done to attain this end by giving a sound education, thoroughly adapted to rural requirements; and with this idea she founded the school now in existence at Bigod's Hall.

6909. It was founded by her—she gave the means to support it?—I should perhaps explain that at that time she had a country mansion at her disposal, which belonged to her, and she simply transformed that into a school, and also provided the means as well.

6910. What are the objects and aims of the school?—Upon that point I have made the following notes:—Those who have paid the slightest attention to rural education will agree that it is very difficult to carry out. This is due largely to the complex nature of the material to be dealt with. It is obvious upon the most superficial reflection that every boy and girl in our country districts cannot become farmers. All, however, have to be provided for in some way or another; and, if we may briefly review the varied interests of a rural community, there are, in addition to farmers and gardeners, the sons and daughters of village tradesmen, all more or less depend-

ing upon the welfare and prosperity of agriculture, but in no sense taking any active part in the practical cultivation of the soil. We have ever kept this complexity of the rural community before us in drafting the scheme of education now in operation, and it has had a most important bearing upon the instruction given. We contend that it is not desirable to carry out a purely secondary curriculum, and a few years ago we submitted this view to the Board of Education; but the result was disappointing, and ended in the Board withdrawing its grant from the school, on the ground that we did not fulfil all the requirements of a secondary school; but before the actual severance took place an attempt was made to carry out the regulations of the Board, and the results of that attempt soon became evident. Boys and girls began to drift townwards, and as the result of an analysis made three years ago we found that less than twenty per cent. of our students went into agriculture or some form of rural employment. The rest (over eighty per cent.) found their way into City offices, shops, railway offices, etc. From this it is clear the school was not fulfilling the object of its noble founders, so we cut ourselves adrift from the Board of Education and struck out to mould a curriculum of our own, and one entirely in accordance with our view of the requirements of the district; and as a result of this modification a notable alteration has been observed—something like forty per cent. of our pupils now pass into some branch of rural industry.

6911. Now, with regard to the area served by the school?—The school serves the immediate neighbourhood for a radius of five or six miles for day pupils, many of whom cycle or drive. The boarders are drawn from a very wide area, and during my connection with the school we have had pupils from the following counties:—Northumberland, Durham, Lancashire,

Mr. T. Hacking.

6910a

6910b

Mr. T. Hacking. Derbyshire, Cheshire, Suffolk, Sussex, Surrey, Buckinghamshire, Nottinghamshire, Yorkshire, Essex, and also one pupil from Ireland. The age of the pupils varies from 12 to 17 years, and of the present number 72 per cent. are boys and 28 per cent. girls.

6912. Are any of them resident in the school?—Yes, 12 at the present time are in residence.

6913. Twelve boys?—No, eight boys and four girls.

6914. They are resident in the school?—Yes, as boarders.

6915. Are there any scholarships at the school?—Yes, we have one or two scholarships—private scholarships really. At the present moment we have two from the Hertfordshire County Council, and Sir Walter Gilbey gives a scholarship, and Lady Warwick also gives two scholarships.

6916. You have no grants from any of the counties?—We are just being recognised now by the Board of Education under the secondary and technological branch, and possibly we shall earn a grant because of that.

6917. You have no grant from the Board of Agriculture?—No.

6918. And no grant from the County Council?—Not at present, but the Essex County Council are considering making a grant to the school of £100.

6919. What fees are paid by the students?—The fees for day scholars are six guineas a year and for boarders 30 guineas a year.

6920. Now, with regard to the curriculum?—I have briefly reviewed the curriculum and I will endeavour to point out some of its main features:—

During the first two years a general course of instruction is followed, for we believe whatever occupation a boy or girl may intend to follow there cannot be the slightest possible doubt that a good general education is necessary. It is, moreover, noteworthy whilst we recognise the necessity of this general education we endeavour as much as possible to make the instruction given possess a decided rural bias, as, for instance, in—

Mathematics.—Practical illustrations of the area of fields, the cubic contents of stacks and manure heaps, the principles involved in simple surveys and determining of area of enclosures by a chain survey and plotting same to scale upon plan. Numerous illustrations might be given, but the above will serve the purpose.

Chemistry is treated upon thoroughly practical lines, but instead of dealing with chemical theory or the preparation of useless gases and compounds, special attention is given to such parts of the subject as have a direct bearing upon the chemical compositions of soils, manures, feeding stuffs and the interpretation of their analysis. In this connection it is important to remember that our pupils are not intended to be chemists, and only need such information that can be of value to them in after life. I should have no difficulty in convincing this Committee—if they could visit the school—of the practical value of this work. Boys of 16 years of age can give a fair estimate of the commercial value of a manure or feeding cake from the analysis. Pupils also carry out a rough analysis of soil, manures and feeding stuffs in addition to carrying out actual experiments with a view to testing many problems connected with the chemistry of plant life. In this manner they become thoroughly familiar with the essential constituents of these substances, and consequently are able to bring greater intelligence to bear in their use upon the farm. A special feature is made of the examination of the soil from our garden and experimental plots.

6921. You have a garden attached to the school?—Yes.

6922. But no farm?—No farm.

6923. You visit farms in the neighbourhood?—Yes, we visit farms in the district.

6924. Now you have a very important subject, biology?—

Biology is treated in two distinct divisions. The first dealing with the life history of the common farm and garden plants. Weeds, their identification and eradication. Commercial samples of agricultural seeds are tested and examined, special attention being given to the identification of impurities and germinative power. The structure of roots, stems, leaves, etc., is practically dealt with, each student preparing and mounting sections of same and in this work they become skilled in the use of the microscope. Experiments upon the physiology of plants are carried out in order that the principles

underlying plant growth may be thoroughly understood. The second section of the subject deals with the physiology of farm animals, but no attempt is made to deal with complex details of physiological phenomena; interesting as these details may be to the expert they are of little assistance to the practical farmer, and consequently the subject is treated with a view to placing information of a simple character before the student.

Physics.—In the physical laboratory the construction of thermometers and barometers, their graduation and reading, is dealt with; also the main principles of heat and light are demonstrated. The physical properties of water, radiation, condensation, specific gravities, etc., form a great bulk of the practical work; the whole of the teaching being so directed as to enable the pupils to thoroughly understand natural phenomena as exemplified in the science of meteorology and this is very necessary, as every student eventually becomes an observer on the meteorological station.

Drawing includes freehand, geometry, geometrical construction and design. A strong feature is made of rapid sketching from nature. Simple plans and elevations also receive attention. All practical work done in the manual training shops is preceded by lessons in making working drawings. Principle of design is a very popular subject, and excellent results have been obtained. In all this training the pupils are encouraged to apply the principles taught in making sketches of wood and metal work as they occur in the every-day life of a farm.

6925. Are all these subjects that you have mentioned taught both to boys and girls?—Yes.

6926. What is the length of the course?—Three years.

6927. Then manual training?—

Manual Training is divided as follows:—

For Boys.—Two years are devoted to woodwork. The chief features of the more common timbers, their defects and general properties are first dealt with, actual specimens in all cases being examined in detail. Tools and their uses are next treated, and immediately following this, construction of the various joints, morticing, dovetailing, etc., are done practically. This work leads up to the making of dog-kennels, poultry-houses, beehives, etc. Each boy is provided with a special locker and a complete set of tools for which he is held responsible.

The third year is devoted to exercises in *Metal Work*, which includes special instruction in the chief features and properties of cast iron, wrought iron and steel. The course worked through includes filing, rivetting, soldering, and forge work, and at the present moment the more advanced boys are engaged in the making of a model steam-engine. The metal workshop is equipped with a 2½ horse-power steam engine and boiler, lathe for turning and screw cutting, drilling machine, grindstone, lathe for wood turning, forge and the necessary tools.

For Girls.—An excellent training in good plain cookery, domestic economy, and household management, needlework, including the cutting-out and making of simple garments. The cookery kitchen is well equipped, and affords ample practice in every-day cookery. A well-equipped laundry is also provided.

That is what is done in what you might call manual instruction; or, dividing it into two subjects, cookery for girls and metal work and wood work for boys.

6928. Then literature, I suppose, is for both boys and girls?—Yes.

Literature.—Systematic lessons in English composition are given in addition to the study of our best specimens of literature. History, geography and French are also taught. The latter subject we intend to drop as we are now well satisfied that the time devoted to the subject could be more advantageously utilised in other ways.

Hygiene.—Includes the consideration of the following items: sources and varieties of drinking water, storage of water, wells (deep and shallow), ventilation, nature and uses of food, principles of cooking, soils and sites, disposal of refuse, personal hygiene.

That is practically all that I have got to say upon the school curriculum as taught indoors; the remaining work is chiefly out of doors.

6929. What is the staff of the school giving this teaching?—At present we have the science instructor, a graduate of the London University, also a graduate for literature, and a City and Guilds man in manual

training for manual instruction, the instructor in domestic economy, and I myself do a considerable amount of teaching.

6930. What you have given us exhausts the theoretical part?—Yes.

6931a. You are now going to give us the practical part?—Yes. The garden plots for which each boy is responsible are 1 square rod in area, and each boy is made responsible for the entire cultivation of his plot. The instructor gives demonstrations as to the best method of cultivating the more common garden crops, and these demonstrations are followed by practical work on the students' plot. Trenching, double digging, hoeing, etc., are all done practically. I may say that no part of the school time table is devoted to this work, but spare time is utilised with great success. These plots always present a very practical and workmanlike appearance, and doubtless play a great part in interesting boys in the cultivation of garden crops. This interest is stimulated by the award of suitable prizes for the best managed plot, hence a healthy rivalry is created. The girls are also encouraged in the cultivating of flowers, and each girl is responsible for a border.

6931b. *Experimental Plots* are about one acre in extent and consist of about 70 plots, about 50 of these are sown down with the best varieties of grasses, clovers, and forage crops. The remainder being devoted to demonstrating the effects of manures upon the growth of garden and field crops.

The following crops are under manurial experiment at present:—

Field Crops.—Wheat, oats, barley, beans, maize, turnips, swedes, mangolds, potatoes, clover.

Garden Crops.—Cabbages, cauliflower, peas, beans, French beans, parsnips, beet, carrots, onions.

The *Manures* used include farmyard manure and various combinations of nitrate of soda, sulphate of ammonia, superphosphate, kainit, muriate of potash, and sulphate of potash.

Two special experiments upon potatoes are in progress, the object of which is to test the value of mature and immature seed, also a comparison is being made of Scotch, Irish and Essex grown seed.

We have also put down a series of inoculation experiments upon clover, lucerne, and sainfoin.

A rotation experiment is also in progress for demonstrating the chief features of the four-course or Norfolk system of cropping.

6931c. The educational value of these experiments cannot be over-rated when it is remembered that the pupils cultivate the ground, sow the seed, and weigh, mix, and apply the manures throughout the year, the pupils make periodical and systematic inspections of the experiments in progress, and note down their observations. These experiments have also proved of considerable interest to the farmers of the district, and were last year visited by a party of local farmers some 60 in number. This year they have been visited already by the Agricultural Sub-Committee of the Hertford County Council, and they expressed the opinion as to these experiments being of the greatest importance to both pupils and surrounding farmers. Arrangements are now in progress for demonstrations upon these experiments to be given to a party of farmers from the Easton Estates, and also the Members of the Hertfordshire Chamber of Agriculture.

6931d. Three years ago we conducted field experiments on eight neighbouring farms, but this work had to be abandoned on account of the development of the experimental work at the school. That is practically a very brief outline of the work in connection with plots. Then there is the Meteorological Station. I have brought here a copy of the work done during the last month by a girl 15 years of age and a boy of 13. Those observations and corrections were done by those observers. (*Handing in documents.*)

6932. The school is a second-order meteorological station?—Yes. All those observations and readings were taken by a girl of 15 and a boy of 13 working together. The Meteorological Station is situated in the midst of the experimental grounds, and is a second-order climatological station working in conjunction with the Meteorological Office. Special instruction is given in the reading of the various instruments, the measurement of rain, etc., and boys as well as girls are trained

as observers. The equipment includes the following instruments:—Barometer, anemometer, solar radiation thermometer, minimum radiation thermometer, dry and wet bulb thermometer, maximum and minimum thermometer, rain gauge, evaporimeter, sunshine recorder. The readings are taken at 9 a.m. and 9 p.m. The observers are responsible for the correction of all observations, filling in the necessary reports and forms for the Meteorological Office, etc. I have brought a specimen copy of last month's observations for your inspection. These readings, corrections and entries were made by a boy and girl. In addition to the foregoing, they issue each day a forecast in writing. This is not always correct, but it forms a most admirable part of the training. We attach considerable importance to the teaching of meteorology, dealing as it does with natural phenomena of the greatest importance to cultivators of the soil. The station is inspected annually by the Meteorological Office, and the work of the pupils most favourably commented upon.

With regard to poultry keeping, considerable attention is devoted to this department, the following breeds being kept:—Buff Orpingtons, Black Minorcas, Plymouth Rocks, White Wyandottes, Silver Wyandottes, White Leghorns, Orpington and Game Cross.

The instruction is practical, boys as well as girls being entrusted with the preparation of the food, feeding, cleaning, collection, and recording the number of eggs from the different pens.

Incubation.—A 50-egg Hearson incubator is worked by the pupils during the season, and large numbers of chickens are hatched under hens.

During the season many fowls are fattened and have secured first prizes at the local shows, thus clearly demonstrating the practical nature of the work done.

I have here particulars of each pen taken during last month by two girls, 12 and 15 years of age respectively, whose duty it was to attend to the poultry. These returns show the number of eggs received from each pen. Preservation of eggs in water-glass is a feature of the work during summer time when eggs are low in price.

6933. Do you have a special poultry instructor?—No.

6934. Who gives the instruction in poultry management?—I do.

6935. To boys and girls?—To boys and girls. Bee-keeping is also made a special feature. Fourteen stocks of bees are kept and worked for sections as well as run honey. During the working season the boys and girls take an active part in the general management, and to show that this is quite satisfactory, I might mention that last year we were highly commended in the competition held by the Essex and Suffolk Bee-keepers' Association for the best managed apiary. Apart from this we have harvested 786lbs. of honey from 12 hives, thus demonstrating to our pupils that bee-keeping when properly managed is really a most important item in the list of rural occupations. The greater part of this honey was taken from the hives by boys and girls. In connection with bee-keeping, we grow a collection of the best bee forage plants, numbering some 80 varieties. This is a feature of the greatest importance to bee-keepers.

Fruit Growing forms a most important part of the practical instruction given. The model orchard is planted with all the leading varieties of apples, pears, plums, cherries, gooseberries, red and black currants and raspberries. This orchard was especially planted for educational purposes.

6936. Does that orchard belong to the school?—Yes.

6937. It is the property of the school?—It is the property of the school; entirely under the management of the school. The work of cultivation, pruning, spraying, &c., is carried out by the pupils. The various methods of training are illustrated, whilst practical work in budding and grafting forms a part of the season's routine. The pupils also take part in the management of the fruit trees on the walls of the kitchen garden. These include peaches, apricots, nectarines, plums, apples and cherries. Whilst the foregoing provide ample instruction on modern lines, we have been fortunately situated in possessing one of the worst neglected orchards in the County of Essex, and this has furnished our pupils with a valuable series of practical object lessons on the renovation of old orchards. This

Mr. F.
Hacking.
6 June, 1907.

Mr. T.
Hacking.

June, 1907.

work is still continued during the winter months of the year.

Horticulture.—In general gardening there is ample facility for pupils gaining a very thorough and practical knowledge. The extensive kitchen garden, with greenhouse and numerous panes, afford ample demonstration of the successful culture of vegetables, etc. Last year 13 of our pupils were examined in this subject by the Royal Horticultural Society, each being awarded a certificate.

Dairy Work.—The dairy is equipped with separator, churns, workers, &c., and a training is given in the testing of milk, separation of cream, methods of ripening, churning and making up of butter. Several prizes have been secured by butter made in this dairy.

6937a The school is one of the recognised institutions for carrying out cheap tests for farmers. Since our recognition in January last 13 samples have been received. No cows are kept. The milk is purchased from neighbouring farms.

6938. By whom is the institution recognised?—By the Board of Agriculture.

6939a 6939. The Board of Agriculture has recognised you for carrying out these tests?—Yes, that is so, and since recognition we have done 13 samples for farmers in the district. With regard to drill and sports, we have military and physical drill, and I might say, briefly, that we find considerable benefit from them. Perhaps the most important part of my evidence is really with regard to the place of the school in a general and co-ordinated system of agricultural education. I have briefly reviewed the curriculum and the practical work done, and I think what recommendations I have to make will perhaps be found more fully in this portion:—Whilst we do not pretend to turn out practical farmers, carpenters or mechanics—this, of course, being impossible at school—we contend that they will return to their homes and farms well equipped and thus able to bring greater intelligence to bear upon their work, and, moreover, if they are so disposed, they are in an excellent position to take further advantage of the short courses held by the various County Councils, and may in some instances be able to proceed to agricultural colleges by the aid of scholarships, although there is no attempt to give instruction with this end in view, as we have no intention of preparing pupils for external examinations.

6939b 6939c The short courses for farmers' sons held at various centres suffer very much at the present time through the lack of suitably prepared material, and many of the staffs at our various agricultural institutes have pointed out that a considerable proportion of the students attending these courses have had a very limited elementary education, and, consequently, fail to reap any practical advantage from the instruction there given. In fact, it is nothing more than a waste of public money to keep these instructors employed in teaching simple arithmetic in order that the pupils may comprehend the meaning of an analysis of a manure or feeding-stuff. County councils should see to it that schools of the type of our own are liberally supported, in order that they may act as feeders to the higher institutes where instruction is given or where winter courses are held. Without such co-ordination they cannot hope to secure returns commensurate with the outlay. Our school supplies this deficiency, because the whole system of instruction given comes between the elementary school, on the one hand, and the places for higher instruction in agriculture on the other. If this state of things became general, there would be no waste of the expert's time and patience. His pupils would have nothing to unlearn, and moreover they are well grounded in the three R's, and the simple principles underlying the composition of soil, manures, and feeding-stuffs. And again, if a rural community can be educated on the lines we have outlined, then, and only then, can the peripatetic lectures given by our county councils be fully appreciated.

6939d Up to the present enormous sums have been squandered in giving useless lectures and so-called technical instruction to rural audiences, who are in no sense prepared to profit by the learned discourses held for their special benefit. Generally speaking, these lectures are only moderately attended, and in very many cases never reach the community for whom they are really intended. In our own district, the lectures are attended by grocers, tailors, shoemakers, etc., who go really to see the magic-lantern show. I attended one of these lectures a short time ago, and out of an audience of 33 only two farmers were present. There is only one

remedy for this state of things, and particular attention must be given to the education of the rising generation. We have already seen some effects from the instruction given, and many of our pupils are now engaged in practical work on farms—and these will doubtless form, in the future, part of the rural audiences of future county council lectures. In fact, they have been trained where to look for information. They are thoroughly interested, and from their ranks our most practical farmers of the future will arise, and moreover we shall then see beneficial results from a wise expenditure of public money. The county councils have the remedy entirely in their own hands. Up to the present large sums of money have gone to elaborate technical schools for the urban districts, which are in turn supported by a large number of scholarships, whilst the education of the rural community is literally starved. I could fill our school to-morrow with bright boys and girls if the parents possessed the means, and hard-working tenant farmers have told me they would willingly send their children if they could afford it. With them this is no mere matter of talk, as I know many of these farmers intimately, and believe their statement to be perfectly true. It is for the children of farmers of this type that I strenuously urge the creation of more scholarships. They are the real backbone of our English agriculture, and if our farming is to maintain a position, not to speak of supremacy, in these days of our ever-advancing competition, we must see that the future workers are suitably equipped for the struggle before them.

6940. How many boys and girls are there at the school at this moment?—31 on the books just at present.

6941. Are they mostly sons and daughters of farmers?—Not entirely so. As I pointed out before, the rural community is a very complex one, there are rural tradesmen, and one thing and another, that one has to consider, and as a result I should say about 40 per cent. at the present moment are sons and daughters of farmers, the rest of course are the sons and daughters of village tradesmen, the village blacksmith, or something of that kind, all more or less dependent upon agriculture, but yet cannot be called farmers in any sense of the word.

6942. (By Lord Barnard.) In some cases those village tradesmen may perhaps be occupiers of agricultural land?—They are to a certain extent. I have several instances in mind in our own county where they have small holdings, possibly of about three to five acres. In that connection, of course, the instruction given would be extremely valuable in their case.

6943. (By the Chairman.) Your main object, of course, is to recruit the sons and daughters of farmers of the country?—Yes.

6944. You do not exclude the other section of the rural community; but that is your main object?—That is our main object.

6945. Do I understand that you are hoping to get a grant from the Technological Branch of the Board of Education?—The Board of Education have just recently recognised us again under the Technological Branch, and, I should imagine, as a result of this year's working we shall receive in the way of grant possibly somewhere about £100, dependent entirely upon the way the work is appreciated I suppose.

6946. Do you expect to obtain any grant from the county?—Yes, we do. I suppose before another month or six weeks have elapsed we shall receive a grant from them.

6947. The boys and girls at the schools go back to the farms?—At the present moment we estimate that something like about 40 per cent. of them go back to farming.

6948. What becomes of the 60 per cent?—They go into the villages, and they in some instances follow various occupations in connection with village tradesmen—some of them become carpenters, and so on.

6949. They do not go into the town?—Not now, they did formerly. That was rather a curious feature of our experience, especially when we dealt more or less on a purely secondary line.

6950. Now the Board of Education will look upon this institution as a technological institution?—Yes, rather in that light.

6951. Of course you will not then come under the

6939c

6939f

inspection of the Secondary Branch?—We should come under the Technological Branch.

6952. Have you been inspected by the technological inspector?—Yes, and I have a copy of their report here. If I am in order in reading it I should be very pleased to do so.

6953. Yes.—This report only came about a fortnight or three weeks ago as the result of their inspection.

6954. Can you give us the substance of it, and leave the report with us?—Yes. They compliment us very highly on our teaching in all branches of the work, and especially do they compliment us upon the practical instruction, the management of our experimental plots and fruit growing. They say: "The care and intelligence with which this practical work is done by the pupils, and the general good order of the gardens, experimental plots and poultry runs, speak well for the agricultural and horticultural teaching." That is briefly the substance of it—they compliment us all the way through on the excellent character of the teaching given. They wish us to make one or two modifications.

6955. The report of the Inspector is very satisfactory?—Very satisfactory indeed.

6956. (*By Mr. Medd.*) I think you stated that Lady Warwick transformed Bigods Hall into a school. Did she convey it in any way to anyone?—No, she did not convey it to anyone.

6957. Then how is the school exactly held to-day? Is the school held at will upon her premises, or is there a lease?—It is just held at will upon Lady Warwick's premises.

6958. I suppose you have it practically on a yearly tenancy?—The place belongs to Lady Warwick, you see.

6959. I meant the school?—The school also belongs to the same estate.

6960. You have a governing body?—Yes.

6961. That is more or less of a representative character, is it not?—Yes, representative of the district, and there are also some county representatives upon that body.

6962. So that of course Lady Warwick could not close the school at a moment's notice?—No.

6963. Apart from that, it merely exists at present at her pleasure?—That is so.

6964. From your evidence, and from the last report to the Board of Education, it is obvious that the school is meeting a definite agricultural want?—Yes, they conclude their report by saying: "The school not only serves a district which is otherwise poorly provided with the means of higher education, but affords a type of education afforded by no other school in this part of the country, and on both grounds it is worthy of support."

6965. It is very desirable, is it not, that the school should be placed on a permanent basis?—Yes, it is desirable that something should be done in that way.

6966. I believe suggestions are now under consideration for incorporating it more closely into the Essex general scheme of education?—Yes, that is so; they have had it under consideration during the last two or three meetings of the County Council.

6967. You mentioned just now that the area served by the school comprised something like a five or six miles radius?—Yes—that is for day pupils.

6968. That would include Dunmow?—Yes.

6969. What is the actual distance from Dunmow?—Two miles.

6970. You are familiar with Professor Sadler's report on Essex?—Yes, I know it well.

6971. Professor Sadler suggested that a school of the higher elementary type might be provided at Dunmow?—He did.

6972. No steps have been taken yet to provide such a school, have they?—None, whatever, to my knowledge.

6973. You are probably familiar with such schools as exist in France, for instance?—Yes.

6974. There would, I imagine, be no difficulty in so organising Bigods, as to comply with the requirements of the English Boards and to supply that grade of education for Dunmow and the surrounding district?—No, there would be no difficulty at all, I think.

6975. It would probably tend to a large increase of pupils?—Yes, I think so, because once a definite scheme like that was put in operation, then, of course, there could be some systematic method of feeding the school from the surrounding elementary schools.

6976. What is the actual distance from Dunmow? Is it within walking distance? It is about three miles, is not it?—To Dunmow Station it is 2½, but really to Dunmow it is not more than 2½.

6977. Lady Warwick talked about getting a motor van. Has she one there now?—Not a motor van, but during the winter months—that is in the worst months of the year—we run a brake between Dunmow and the school.

6978. If your school were developed at all upon its present lines, or more in the nature of an *école primaire supérieure*, it would serve not only Essex, but possibly Hertfordshire?—Yes, I think it is very desirable that that view should be kept in mind. The school with its equipment, and so on, could easily serve two or three authorities round there.

6979. You referred just now to a visit from the Hertfordshire farmers?—Yes.

6980. Could you give the Committee their impressions of the visit?—Yes. I have a letter from their secretary. This is the letter I received from Mr. Dean the day after their visit. He says: "Dear Mr. Hacking,—You will be pleased to know that the gentlemen forming the deputation who visited your school yesterday were very favourably impressed with what they saw."

6981. That is very satisfactory. Have you any idea whether the Hertfordshire County Council propose to subsidise you in any way?—Only this: that seeing that the Hertfordshire County Council had given up their grant to Ridgmont, I suggested that the sub-committee should then visit Bigods with a possibility of making a grant to the school, and several members, the vice-chairman in particular, said he did not see any reason at all why they should not make the school a grant, and I think, after the very favourable expression which they have given voice to in this letter, that they will seriously consider the question of giving a grant to the school. I have already officially applied to the Committee for one, and I daresay it will come before them at their next meeting, or at any rate in the near future.

6982. I believe it is a fact that the more the farmers visit and see your school the more they appreciate it?—That is so.

6983. Lord Warwick personally interests himself in your work, does he not?—He does.

6984. And when at home is more or less in touch with it?—Yes. Speaking of the visits of farmers, I had a letter from a farmer the other day, a member of the Hertford Chamber of Agriculture. I, of course, had invited them, and I pointed out to him that it was desirable that more farmers should visit the school, especially the agricultural part of it and he says, "I shall be very pleased indeed to advise the members of our Chamber to visit your school. I think it a great pity that such excellent work as you are doing is not better known and more appreciated," so that he is endeavouring to influence the Hertford Chamber of Agriculture to visit the school, or at any rate to send a deputation. That is from Mr. Graham, he is a Councillor for a division near Bishops Stortford.

6985. There is no other school in England of this type?—Not that I am aware of. Of all the schools that I have visited, and I have visited all those that have any pretension to this kind of work, I do not know that there is any on exactly the same lines as ours.

6986. I do not think they claim to be. The whole of this is due to private initiative and private generosity?—That is so.

6987. (*Professor Middleton.*) Might we have just an idea of the cost of maintaining an institution like this?—At the present moment it is about £750 or £800 a year.

6988. I gather from what you said that you did not not approve altogether of the county lectures which you have heard?—No, I did not.

6989. Is your charge a general one against county lectures, or is it against one particular type of county lectures?—Very possibly it may be the particular type we get in Essex. Of course I would not for one

Mr. T.
Hacking.

6 June, 1907.

Mr. T.
Hacking.
6 June, 1907.

moment say that county lectures, generally speaking, are not valuable, but as we get them in our particular district I do not think they do much good.

6990. What is the trouble, do they deal too much with general principles and do not go for specific points?—My chief objection is that they rather deal with a too technical aspect of the thing. I do not think there is an attempt made to simplify it.

6991. So that they are above the heads of their audience?—Entirely above. I can give you a very humorous illustration which occurred to myself after attending this particular lecture which I referred to in my evidence. I was coming down the road, and evidently a very ordinary sort of man came along behind me—it had fallen to my lot to move a vote of thanks to the lecturer—this man walked along with me, and said, “Well, Sir, what do you think of these lectures?” I said, “Well, they seem all right, do they not,” and he said to me, “I do not know. That man must have been a clever man, but we practical men do not understand these ‘alblumenoid’ things that he has been talking about.” The lecturer had been talking about the composition of foods, so that it was entirely above them.

6992. Have you given any lectures on local experiments?—Yes, I have given some myself. For my own lectures I must say I have been very well satisfied with the way they have been appreciated, but they have been of rather a different type; they have been market day lectures principally.

6993. Have you had lectures given on the results of experiments?—Yes, and with very good results indeed.

6994. So that your remarks are applied to the type of lecture which deals with general principles?—Yes, rather than to special subjects.

6995. When there is a definite object chosen and put before the farmer there would not be the same lack of interest in the lecture you think?—No. I have found myself that very often when a lecture supposed to be an agricultural one has been given in Dunmow, all Dunmow has turned out and attended it, tailors, grocers, tradesmen, and all the rest of them, and you will find practically no farmers there, and yet that subject is supposed to be one which is specially interesting to agriculturists. As a result of that, of course, it is mere money wasted. Take the other case; I gave some time ago a special course of lectures to farmers on market days in connection with the Hertford County Council at Bishops Stortford, dealing with the practical side of many experiments, not only in the district, but also experiments carried out by investigators, and the average attendance at those lectures ran out at about 40, and they were thoroughly interested from beginning to end, and in fact since then I have really had more demand for lectures than I can fulfil.

6996. (*The Chairman.*) Who pays for the lectures?—The Hertford County Council in that case. I have not done any lecturing for the Essex County Council.

FIFTEENTH DAY.

Tuesday, 11th June, 1907.

PRESENT :

The Right Hon Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.
Lord MORETON.
Mr F. D. ACLAND, M.P.
Mr. THOMAS LATHAM.
Mr. J. C. MEDD.

Professor WILLIAM SOMERVILLE, D.Sc.
Professor T. H. MIDDLETON, M.A., M.Sc.
Mr. A. E. BROOKE-HUNT (*Secretary*).
Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. H. C. HOWARD, called and examined.

Mr. H. C.
Howard.
11 June, 1907.

6997. (*By the Chairman.*) You are a member of the Cumberland County Council?—I am.

6998. You are prepared to give the Committee some information as to what you have done in Cumberland with regard to agricultural education?—Yes; as regards the Newton Rigg Farm School more particularly.

6999. Please.—To begin at the beginning we endeavoured first of all to start a school with Northumberland and we had very nearly got that settled up, but unfortunately at the end they preferred to have their school nearer Newcastle, and so that threw us off. We therefore entered into negotiations with Westmorland, and in 1896 we took a lease of a farm of 116 acres about a mile and a half to two miles away from Penrith. In 1897 we bought the farm. The agreement with Westmorland was that they should pay, say, £100 a year towards the cost, and the net cost to Cumberland during the last five years of carrying on the farm has been on the average £658 a year. The highest was in 1893, when it was £694, and the lowest was in 1895, when it was £598. Of course, out of that we pay £250 for interest on the purchase and on the improvements that we have made. The capital that we have expended up to date is £9,582. Towards that Westmorland paid us £300, but we are paying them back at the rate of £50 a year, because they prefer not to own any part of the farm, but to pay us a certain sum of money a year. We have almost paid off that £300—I think we have got another

year or two, and then the whole of the place and all the stock and everything will belong to Cumberland. As regards the money that we have devoted to agriculture I do not know whether that would be interesting?

7000. Yes.—We have received from what is generally known as the “whisky money” on an average £6,500 every year, and very early in our proceedings we arranged to devote £2,000 a year to agriculture, but, as a matter of fact, we have never spent that £2,000—I think the average has been about £1,400 a year. This school has cost us £650 a year. I might say the dairy van was the first thing we started; before we thought of the farm we started the dairy van to go round the country and teach the people a better system of making butter. That has been very successful; it really was so successful that it induced us to embark on the larger undertaking—the farm. The dairy van costs us about £250 a year, experimental plots about £100, gardening £150, and in addition to that there is something towards poultry keeping, and a grant which we give to the Bee-keepers’ Association. I am sorry I have not got the totals for those, but the total amounts to about £1,400 a year. As regards the dairy van, we have had since we established it about 2,000 pupils who have passed through, and I think on the whole our dairy teaching has been very successful, and has done a considerable amount of good work. A number of our students at the farm get very good places as dairymaids, and I think everybody is

7000a

*Mr. H. C.
Howard.*

11 June, 1907.

agreed that the making of butter has certainly progressed very considerably in the right direction since we started the dairy van and the farm. We are very anxious in Cumberland about taking up the question of gardening in the elementary schools; we have not done a great deal so far in that. I do not know whether one should say anything about that before this Committee?

7001. Yes; give us the information by all means.—We are trying to push that as much as we can, and I should very much like to see myself steps taken so that all pupil teachers who go to secondary schools should have opportunities given them to learn at all events the elementary parts of agricultural work, especially gardening and botany, so that they might be qualified when they take village schools to teach the children all those things which are so essential to keeping the people on the land, which is the great cry nowadays. I hope that the Government may see their way to assisting this movement, as, I say, by making it compulsory in the secondary schools in the country that pupil teachers should be taught the elementary principles of botany and the principles of gardening, and so on. I do not want to go farther than that, but I want them to be qualified when they become teachers in elementary schools to teach the children there those subjects.

7002. You think an elementary school in a rural district ought to have a garden attached?—I think so certainly.

7003. You have several of these school gardens in operation?—Yes; I forget the exact number.

7004. They are under the superintendence of your horticultural instructor?—That is so. Then we give lectures on poultry keeping by the dairy teacher at the farm in the winter time when the girls are not there. The boys are there all the winter. She has more time then, and she goes round the country giving lectures on poultry keeping.

7005. That instruction in poultry rearing is given during the winter months?—Yes.

7006. To the boys?—It is given by lectures round the country, not at the farm itself. Of course it is given at the farm, but in addition to that the dairy teacher goes round the country and gives lectures at villages upon poultry keeping, and, as far as my own knowledge is concerned, it has done a considerable amount of good I am sure, because the amount of poultry which is kept now has enormously increased to what it was 10 or 12 years ago.

7007. Those lectures are well attended?—Yes, very well attended. I might perhaps say one or two words as regards the Government grants which are paid. I think it would be a great improvement if the Government Departments would agree to unite, and that we should not have to deal with so many departments. I must say that I think the Board of Agriculture's system of paying a lump sum is far preferable to the way in which the Board of Education pay by head or by a certain number of hours. If the grant was given in proportion to the good work which the inspectors of the Government thought was being done in a lump sum, it would materially help us in many ways, and I think it would save an enormous amount of time to the officials, and to the people in London as well as to our own, a great deal of whose time is now taken up in going through these absolutely unnecessary, and, I think, ridiculous details which are sent down, and which are of no service to anybody really, because, so long as the Government do not pay more than their inspectors vouch for as being a proper share which a school in which instruction of any kind which is given by the County Council is worth, I do not think that they need go into any other details. They might leave the rest to the local authority which, after all, is on the spot, and which knows the peculiar circumstances of the case a great deal better than any Government inspector can possibly know them, and I am sure it would be an enormous relief to our own officials and also to the Government if we could have a lump sum handed to us as I say calculated upon the amount of work which the inspector thought we did in the year in the subject.

7008. You are aware that the system of paying a lump grant is now adopted by the Board of Education?—Well, you see we are dealing with three separate Government Departments practically, the Board of Agriculture, the Board of Education, and the Local Government Board; they are all mixed up, and we never know which to apply to, and we are always afraid that if one pays a grant we shall not get it from the other. That is the opinion of our Secretary of Education as well, that we should do far better if we could deal with one Government Department only. You mentioned that the Board of Education pay a lump grant. In what way do you mean that they pay a

lump grant? They do not pay a lump grant as regards elementary schools and evening classes.

7009. I understand they pay a lump grant to institutions such as yours?—Yes, that is so.

7010. But your opinion is that there would be a great advantage in centralising the work in one department?—Yes, I think so.

7011. What is the attitude of the farmers towards your school?—I think I had better leave Mr. Tinniswood, who is a large farmer in the North and who is here, to give evidence on that point.

7012. Are there any scholarships at your school?—Yes; we give a scholarship every year. If a boy does sufficiently well he can take a scholarship at the Durham College of Science.

7013. Do you have many boys from the elementary schools?—Yes, a good proportion. Sometimes it may be a year or two before they come. They come at a good age, many of them—they have generally done a year's work on a farm meanwhile, and they come on to us for the winter.

7014. Your school is mainly a winter school?—Yes, for boys, and in the summer for girls.

7015. So that your staff is always busy?—Yes, they are always busy because if they are not engaged regularly at the farm, they give lectures. They are always kept fully employed the whole year round. The lecturer, Mr. Lawrence, is here to-day and he will be able to give you all the details as to the work.

7016. Lectures are given on agricultural subjects?—Yes; round the country. In fact throughout Cumberland and Westmorland now.

7017. Are they well attended?—Yes, as a whole, very well.

7018. I suppose the lectures are in connection with the experiments?—Not altogether—various subjects. Mr. Lawrence himself gives a number of the lectures, and he will be able to tell you all about that.

7019. Do the farmers come to the farm to watch the work that is being done at the farm?—Every year there is a certain number of farmers who always come to the farm and look round and see what is being done. I wish there were more. The numbers increase, I think. We had a visit the other day from a number of Essex dairy farmers who came up into the county and looked round; they also visited Mr. Tinniswood's farm at the same time.

7020. Dairying is the principal subject you take up at the farm?—Yes, in a way it is, but in the winter the boys are taught everything they can possibly want to know as far as we can give them instruction on the farm, that is to say, book-keeping and surveying, and all sorts of things.

7021. And farriery?—No, they do not learn that.

7022. Do you do any cattle breeding?—Yes.

7023. And sheep breeding?—Yes, we have experiments in sheep breeding.

7024. You also have fruit plots?—We have a fruit plot. That is more modern rather; I do not think we have had that more than five years.

7025. Have you an agricultural Committee?—That is a Sub-Committee. That is a Joint Committee of Westmorland—the two counties are joined together on the Agricultural Committee.

7026. (*By Lord Barnard.*) When you agreed to set apart £2,000 a year for agricultural education, did you go on any particular basis for arriving at that figure?—Yes. We took the amount that we received, say £6,500, and we thought that £2,000 was a fair proportion to devote to agriculture out of the money. Of course, we had other interests to attend to—mining, fishing, and so on, and we thought £2,000 a fair proportion for agriculture and that we could spend it usefully; but so far we have not spent as much, because we did not think we could spend it profitably, and we have not gone beyond what we thought we could properly do.

7027. I suppose Cumberland is mainly an agricultural county?—Yes. There is a good deal of mining, of course, in parts.

7028. I do not understand how it is you have not been able to spend more than £1,400 on agriculture, but you have practically given us the answer just now that you thought you could not spend it usefully?—No. I think we would have been very glad to have spent more on agriculture if we felt we could have done so with profit.

Mr. H. C.
Howard.
11 June, 1907.

7029. I was disappointed a day or two ago on reading the printed Minutes of Armstrong College, to see that you had intended to decrease the amount hitherto spent on experimental plots?—That is so. We have had those plots going for a considerable time, and it was the opinion of the Committee that with the exception of keeping on two it would be no more use to the county to keep them going, and, as you know, the question of secondary education has been forced very strongly to the front lately, and we are now about to build four or five secondary schools in various parts of the county. That is going to cost £30,000 or £40,000, and it was necessary to look round to see whether we could save money. We had a Committee sitting in the winter for that purpose. We had to try and save all round, and although, of course, we did not want to, we endeavoured to cut off as much as we could. Our object was to save £1,000 a year.

7030. Are you anxious to obtain further financial assistance from the Government?—Yes, I think we are entitled to it: and there is no doubt we could spend it usefully if we got it. Of course, it is merely a question whether we are to tax the ratepayers heavier, or get the money from the Government. I think we are hard enough on the ratepayers as it is.

7031. You think if you had more money you could usefully expend it?—Yes, I have no doubt we could.

7032. The Farm Committee, I think you told us, is a Joint Committee of the two County Councils?—Yes.

7033. It reports to both of them I suppose?—Yes, a report goes to both.

7034. Who keeps the accounts?—The accounts are kept by the manager.

7035. Do they pass through the County Council offices?—They pass through our office, not Westmorland, because Westmorland is merely a contributory Council. They appear every year in our financial statement.

7036. I do not know whether your school is full or not—perhaps Mr. Lawrence can tell us that?—Yes.

7037. Do you think it would be possible to induce students to come from the neighbouring counties—say the county of Durham?—We have outside students, not many. I should think in the last two or three years we have had perhaps half a dozen or more. We have had students from Scotland, and we have had them from the south of England.

7038. Supposing, for instance, your county were to communicate with the county of Durham, and say "Here we have got this institution and we are willing to take in students," and so advertise the advantages which you have got to other county councils, do you think that could be usefully done?—Of course, Northumberland has its own school in the same way as we have.

7039. Northumberland has no school, I think?—It has got a farm.

7040. They take no pupils?—I thought they did. Of course we are limited in amount; we have not room for more than eight or ten at a time, and it would necessitate considerable building if we were to go in for a scheme of that sort.

7041. I was putting the question rather from the view that if you had more national money could you make your school better for national purposes—of course on payment by the scholars?—We really take our own and Westmorland children at a mere nominal sum. The boys pay £4 for the winter, that is, for their keep and teaching and everything, and the girls pay nothing; so that we give them instruction very cheap. We should have to give it a good deal of consideration, and it would mean seeing where we were to get a large capital sum from.

7042. What I was suggesting would not apply to your school only but to all the schools in the country. The instruction at your school is not limited to teaching young men and women agricultural and dairying knowledge, because I see you give lectures to farmers and so on?—Yes.

7043. And probably information to farmers?—Yes.

7044. Should I be right if I considered an institution of this kind not only an institution for giving education but an institution for collecting and disseminating information?—I think so. You might describe it as such; we issue leaflets and so on.

7045. And work in connection to a certain extent with Armstrong College?—Yes, we do, and we have been very

grateful to them for the assistance which they have given us. Mr. Murray comes over to us from the Armstrong College.

7046. Do many of your boys go to Armstrong College?—I do not know that many of them have gone there, but the last three scholarships have gone there.

7047. (By Lord Moreton.) I do not think you have told us the average age of your boy pupils?—I think probably the manager would be better able to answer that, but I should say from 16 to 24.

7048. Do you find that the farmers' sons attend the lectures, and the younger people, or do you find that they leave it to their parents to come?—I think they do; certainly at first there was a difficulty in getting them to come, but they are much better than they used to be.

7049. That applies to the younger ones?—Yes.

7050. I suppose you would confine the instruction you have mentioned to teachers who intended to take up posts in rural schools?—Yes.

7051. They have a good many subjects to take up, have they not?—Yes, but a great many of them might be dropped to advantage to my mind.

7052. (By Mr. Latham.) What might be dropped with advantage?—I think I must leave that to people to form their own judgment upon, but my opinion is that there are a good many things which really might be dropped which are not nearly as necessary as instruction in botany and horticulture and agriculture. They are much too fond of science and art now. That is only my own opinion, but I think anybody going through the list might strike out a few things which are not so important to the life of the country as these agricultural pursuits.

7053. That applied rather to science?—Yes, all these things do for a limited number of people—French and German, and so on, and Latin and Greek. I think the great majority in the country would be far better if they were taught to understand the things which really belong to the country, and which really should form part of their life when they grow up, instead of being taught a lot of outside things which are probably no use to them whatever.

7054. You think a highly practical knowledge is of more value to the agriculturist than the scientific knowledge?—I think both are of value, you cannot take one and say this is the most valuable. I think they are both valuable. I do not think scientific knowledge is of any use without practical knowledge.

7055. Could you give us a little more evidence about your dairy teaching, or would you rather leave that to another witness?—I have not got up the statistics, and I should not like to speak just from memory; I would rather leave that to the manager.

7056. With regard to your lectures, who were the principal people that attended them?—People in the villages. It depends a great deal, of course, on what subject is taken up. For instance, if you have gardening, everybody in the village would come who was interested, because they all have their little gardens, and they want to know what they can about it. We have had lectures of all sorts. I think Mr. Lawrence, who gives a great many of our lectures, could tell you what his audiences are like better than I can.

7057. What is the class of pupils you get?—A good many of them are farmers' sons, but a certain number come out of towns who wish to take up agricultural pursuits.

7058. What are those people who come out of the towns; whom do they represent?—The small shopkeepers and that sort of person.

7059. Do you have any men that are likely to go on as surveyors and land agents and that sort of thing?—I think so. If they choose to go on they would get a foundation there which would carry them on, but I do not think many would, because most of them come from farms and go back on farms.

7060. You made a remark just now about taxing the ratepayers. Provided all this money goes to secondary education which used to be used for agricultural purposes, it will be very difficult to keep up any agricultural education at all I suppose?—I hope we shall keep it up as much as we have done.

7061. Do you find your County Council are inclined to limit their expenditure on agriculture in consequence of the demands for secondary education?—No, I do not think so. They are anxious to limit the expenditure all round as far as they can, and agriculture has to suffer as well as everything else.

Mr. H. C.
Howard.

11 June, 1907.

7062. With regard to these new schools that you spoke of building, and which will cost you £30,000 to £40,000, if that is to come out of the money that formerly was used for agricultural purposes, will not that lessen the amount of money that you have at your disposal?—It will take some of it away. For instance, as Lord Barnard was asking about these plots, that was one of the things we thought must disappear, because we wanted to limit the expenditure on agriculture, and those things which we thought were less important we have struck off, so as to enable us to have more money for the secondary school work.

7063. Is it fair to ask you what you have struck off, or had I better ask another witness that?—I am afraid I ought probably to have refreshed my memory on that point. We have made a saving, as we hope, of about £1,000 a year in what we have been spending out of this "whisky money." We have struck off a considerable amount from a different number of things. Evening schools, I think, have to suffer more than anything else.

7064. Do you carry out many experiments at the farm?—Yes, we always have some experiments going on.

7065. Do you carry the experiments out over the county as well as at the farm?—We have had these plots of land in various parts of the county which have been going on now for a considerable number of years, and I think we have learnt about as much as we possibly can learn from them, and that is the reason that we were only going to keep one or two going.

7066. In consequence of your spending less money the experiments will suffer?—Everything has to suffer. We have less money to spend on everything, and we have to strike out those which we think are least important.

7067. That is a good reason for your asking for more?—Yes, I should say so myself.

7068. Although you have struck off all those different things, you have not lost any idea that they are of value to the country?—I do not say they are not of value, but I say we have struck off those things that we consider are less valuable to the country.

7069. That is not what I wanted to know. If you had had money to spend would you go on again very much on the same lines that you went on before?—Yes, we might alter them a little as it appeared to us was better.

7070. Have you ever done anything else besides experiments? Have you ever done anything in the farriery line?—No, except that we have had lectures given round the country.

7071. Who has given those lectures?—They have been given by people selected in the different districts who understand the subject, but we certainly have not done much in that way for some years. I think we did a lot of that kind of work at first.

7072. Were the lectures well received?—Fairly well, I do not think they took extremely well, because they did not appeal to a great many. You want to have them more in big centres and get people from the various villages all round to come in. In a village you would hardly get a big enough audience to justify giving a lecture.

7073. Possibly you would if you held them in the market towns?—Possibly. If you held them there no doubt it would be a very useful thing.

7074. Do you consider the agricultural community of the district value this education?—I do.

7075. Is that the younger or the older men?—I think they both do. There has been a great change of feeling amongst the older members: they were very much against this at first, but most that I speak to now are in favour of it, and think it is doing their sons a great deal of good. All the young boys who are there appear to like the work and take a great deal of interest in it, and I have no doubt in my mind they are a good deal improved by the training they receive.

7076. You can see a much larger field of work, provided you had funds at your disposal?—Yes, of course we could extend no doubt.

7077. (By Professor Middleton.) What did you say was the total amount of capital expended on the farm by the county?—£9,582.

7078. You have purchased the land and buildings?—Yes; a good deal of that was improvements of buildings.

7079. What is the area of the land?—116 acres.

7080. The cost of the school is about £600 per annum?—Yes.

7081. That is exclusive of any interest on the capital outlay?—No, that is inclusive of everything.

7082. The total cost of the school inclusive of everything is £658 per annum?—Yes.

7083. (By Mr. Medd.) What is your exact relationship to the Armstrong College?—We agreed to pay them so much for the work they did for us; for instance, they examined the students at the farm and then they assisted us with these experimental plots, and now we are paying them so much towards Mr. Murray's work as the teacher of gardening.

7084. Do any large proportion of your pupils go on to the Armstrong College after they have left you?—We have had several—not more than the one who gets the scholarship. He goes on as a rule. I do not think any of the others have gone, so that would be one a year, although I do not think we have each year had one.

7085. Have you ever considered how far your farm school might be made a permanent institution in connection with the Armstrong College?—No, I do not think that has ever been considered.

7086. It is desirable in each area to have varying grades of institutions, that is to say, the higher grade at the Armstrong College, and possibly an intermediate grade elsewhere?—Yes.

7087. Possibly your school here might fulfil that function if it were developed?—Yes, it might. Of course it would be better really if other counties had schools similar to ours, which might feed the Armstrong College. There is no doubt that each locality would be far better with a school of this sort in which to train their own people.

7088. One feels that each county cannot afford the expense of maintaining an institution of this kind, and that probably one or two counties must combine, as you do?—Yes.

7089. Unfortunately we have not got the *precis* of your evidence and that of the other witnesses before us?—No.

7090. They have gone astray?—Yes, I am very sorry.

7091. How much land have you connected with your institution?—116 acres.

7092. How many pupils have you as a rule?—We take about eight boys in the winter. We have four courses of girls in the summer—about eight or ten at a time.

7093. Could you accommodate more?—No, we could not, we are full up with that.

7094. Do the two counties, Westmorland and Cumberland, jointly support the institution?—Westmorland pays a contribution to Cumberland of £100 a year.

7095. I see £125 is put down here?—They gave us £300 when we purchased the farm and bought the stock and made the improvements, and we are paying that £300 back at the rate of £50 a year.

7096. Then it costs Cumberland about £500 a year?—About £658.

7097. Is there any complaint in Cumberland as to the expenditure of this money?—You find certain people certainly who complain, but they get fewer and fewer I think.

7098. Of course, the number of students, eight or ten, is a comparatively small number, is it not?—That is so.

7099. You do not think you could attract more?—I think that probably we could now if we built, but we should have to make an extension; we have not the room; we have already built four new bedrooms, and we should have to build any more that would be required.

7100. That, of course, could all be done if some such idea as I have in my mind could be carried out, namely, that your institution should become the intermediate institution for the northern group of counties?—Yes.

7101. Not merely being confined to Cumberland and Westmorland, but providing equally for Durham and Northumberland?—Yes. That would mean, of course, a complete change of everything; we should have to have fresh governors—governors drawn from all quarters.

7102. Yes. There is a great absence of facilities for the sons of small farmers, is there not? As a rule we cater for the advanced man at the collegiate centre, and there is very little done for the lad of 15, 16, or 17?—Yes.

7103. Do you cater for him here?—We do.

7104. Of course such an institution as yours is capable of development?—Yes.

Mr. H. C.
Howard.

7105. Do you do anything for the training of elementary teachers?—No, nothing.

11 June, 1907

7106. Do not you think it would be possible to hold courses on Saturday afternoons for elementary teachers?—I think our employees' time is all filled up, and that they could not possibly do anything more as it is. With regard to what you said about our serving the four northern counties, I still think it would be far better if they were more scattered—I mean if you had one of these schools in Northumberland; ours to serve Cumberland and Westmorland, and perhaps one for Northumberland and Durham. I do not think it would be an advantage to have one large school in one county.

7107. What is your capital expenditure so far?—About £9,500.

7108. That is a large sum to raise to-day?—Yes.

7109. It is becoming increasingly difficult to raise money?—It is, but, of course, if Northumberland and Durham wished to join us we should expect them to pay.

7110. They would pay you an annual sum?—I do not know that we should do that for another county. We did do it for Westmorland, but I am not sure that we should do it again.

7111. Perhaps not, but, however, it is a matter that might be considered?—I quite agree, it might be considered.

Mr. ROBERT TINNISWOOD, called and examined.

Mr. R.
Tinniswood.

7112. (By the Chairman.) You are an Alderman of the Cumberland County Council?—I am.

7113. Chairman of the Cumberland and Westmorland Joint Agricultural Committee, and a member of the Committee of Management of the Newton Rigg Farm School?—I am.

7114. You are a representative of the Cumberland County Council upon the Agricultural Committee of the Armstrong College?—I am.

7115. And a member of the Council of the Cumberland and Westmorland Chamber of Agriculture?—That is so.

7116. Perhaps you will explain to the Committee what the relationship is between the Newton Rigg School and the Armstrong College?—The relationship consists very much of the grant made to the College and the services we get in return—lectures in forestry and so on, and the oversight of the experimental plots that we have had. Then we give scholarships to the Armstrong College for the most suitable pupils. Of course it is by examination that they are qualified to go there. I think those scholarships run for one year each and are renewable for 3 years. I believe we are running one now for the third year, and I think for the second as well, so that we may have three running concurrently in that way.

7117. Some of the boys from the Newton Rigg School go to the Armstrong College?—Yes.

7118. Straight from your school to the Armstrong College?—Yes, after they have passed the necessary qualifications. Formerly we contributed £200 a year to them, and in return we got lectures from them, and they also superintended the experimental plots. I think they consisted at one time of 20 hay stations, 6 rotation experiments and some turnip and potato plots. We have now largely reduced the number of plots, and consequently have reduced the grant that we made to £70. We thought that the time had come when there might be a fewer number of these experiments and that the publication of the experiments that had been carried out in the past was all that was required to be done; and because the farmers themselves had taken considerable advantage of those experiments and had learnt practically all that was to be gained by them, and also because the farmers upon whose farms the plots were were getting somewhat tired of it. The consequence is that we thought four central plots would perhaps be sufficient in addition to the one that we have at the Newton Rigg Farm. My own opinion is that more might be done at Newton Rigg Farm, because it is there done not under so much what I call sufferance, as it is under the control of the farm governors; and it is also an interesting matter to the pupils who go there to see these experiments carried out, and to have the results of them demonstrated clearly to them.

7119. You consider that the work done by the school may justly be described as pioneer work?—Yes, so far as the students go it is. Of course, with regard to the teaching of the young men and young women, and to all sorts of lectures that are given by our manager there and his staff, I think they appeal very much to the farmers and to the practical farmers, and I would say to the best of the farmers too, and the prejudice that existed at first, when the school was established and the lectures were given, has very much died down, and the advantages I believe have been very very great indeed to the farmers of Cumberland. I know from experience and from information, and I would say that the most successful farmers have taken advantage of the results of these experiments, and have applied them to their own practical farming, and I believe the results

have been very beneficial both from the agricultural point of view generally and to the farmers themselves; so much so that I would say with regard to the results of the experiments that no farmer now need make a mistake with regard to the purchase and to the use of his manures for the different crops that they are required for; neither need he be imposed upon by dealers and merchants when buying these articles. The benefit to agriculture in that sense, I am sure, has been very great indeed.

7120. Is there any co-operative association in Cumberland among the farmers?—There is not so much. We only have one farming co-operative society that I know of at present. There was one, I believe, in the eastern part of the county, and there is one now which in the earlier years of its existence I think was a great deal of benefit to the county because it was controlled and managed by men of experience or an expert who took upon himself to know the price and the value of manures and seeds and feeding stuffs and also laid down a basis upon which the farmers were able to purchase their manures much cheaper than they had done before, and also to take action in case of any grievance or any article of manure or feeding stuffs not being up to their value. It has had a most extraordinary effect upon what I will call the commercial aspect of farming in Cumberland. I believe it was the means of making merchants and dealers more careful and of the farmers being able to purchase manures at a reasonable price, but I do not think that it is spreading in its influence as much now as it was at the time it was formed. Still, it is a very popular and deserving society by which a great deal of good has been done.

7121. You yourself would be in favour of extending the number of co-operative associations amongst farmers?—I would rather be wary in saying that I should be much in favour of it. Like all other co-operative bodies it gets into the hands of what I would consider managers and people who want to be well paid for the work they do, and I would rather that a really good knowledge of commercial life and business was circulated and that the farmers should become their own purchasers, because I am sure now if they are taken in by the purchase of any manures or feeding stuffs it is their own fault; they do it with their eyes open because the education with regard to the value of the ingredients of manures and feeding stuffs has been made so well known throughout the county by our own experiments and by those of the Armstrong College. The education that has been spread among the farmers has been so beneficial that we are now, I think, dealing with a different class of men from what we had 50 years ago, and that they are now beginning to be able to conduct that business for themselves. I think agricultural societies should take up more the educational part in connection with their exhibitions, and if Chambers of Agriculture were to have papers or essays read upon modern farming compared with farming 50 or 100 years ago, and bring up the requirements of both landlords and land agents and others as well as farmers to the present-day times, it would do a great deal more good in my opinion and be very beneficial and for the good of the country and for agricultural purposes generally.

7122. Are there any butter factories or creameries in Cumberland?—There have been, I think, one or two, but not in Cumberland so much. There is one in Westmorland, and we have still a very large one in Cumberland, but one or two have not been successful.

7123. Why have they not been successful?—I think

7121c

7119a

very much on the ground that for creameries to make cream into butter was not really a profitable investment. The distribution of milk itself and cream has been more successful, and the one creamery that I had in mind failed because it was not in a district where it could distribute its milk as it is done by the Cumberland Dairy Company, for instance. There is now a system in the market towns of Cumberland, at Penrith and some others, whereby farmers take in their butter in the bulk and the dealers grade it up together. That has reduced the loss to the farmers, I believe, considerably because we have not all learnt yet to be good butter makers, and this undoubtedly helps to send the butter away in a very much better condition, and the consequence is that they themselves have rather disestablished the creameries. But in connection with the other large creamery at Low Row, the profitable part is in the distribution of cream and milk; the making of butter is not so profitable a thing—a certain quantity of it is, but not to depend upon it so much as the distribution of the milk and cream. It is growing to be a very large business the distribution of milk and cream, and I think much more profitable than butter-making, but still the making of butter is successful now in connection with it.

7124. If butter-making could be done in that district, then you would be in favour of the establishment of butter factories?—Certainly. We have some large co-operative societies and others have held meetings in the villages with a view to establishing such-like creameries or butter factories, but as yet they have not come to maturity. Nothing has really been done. Farmers attend in large numbers, expecting that some benefit was going to come to them, but when all was explained and laid down, they did not see that there was much benefit and the great tendency now is to sell your milk if possible right away from the farm wholesale, even at a lower price than to make it into butter for the creameries. It is a drawback with regard to the rearing of young stock, but there are substitutes now and instead of giving the young stock all skim milk, as they used to do formerly, they now just add a little new milk to the other ingredients and they are mixed together and this is the way now that a good many farmers rear their young stock where they sell their milk wholesale. The wholesale price of milk even is much more profitable and certain than the making of it into butter.

7125. With you the sale of milk and cream is a profitable business?—Yes, it has been the most profitable of any business as connected with farming. I remember beginning myself to sell milk well on to 30 years ago, and at that time my farming friends looked upon it with a very great suspicion and said that they thought it was on the road to ruin to sell your milk, but now they have all come to it very much and think it is the most profitable way of contending with the times. I think the milk industry in England at present has still a splendid future before it if landlords and land agents and authorities would see that everything in connection with the occupation of land were put into proper order and condition. We are now meeting, as you know, some very strict regulations, and farmers are obliged not only to have their animals healthy but to see that all the surroundings in connection with the production of milk and its distribution are in proper condition.

7126. The farmer is careful in the selection of his cows—he pays great attention to the milk-giving capacity of the animals he breeds and buys?—The real dairy farmers do so, but as a farmer of large experience my own opinion is that I do not think there is such a great advantage to be gained from a farmer being set entirely on what I might call producing the greatest quantity of milk. If you go into the entire production of milk you introduce into your herds, to some extent, animals that will milk themselves almost to death. You have nothing realised at the end of their service to you. I like in this matter, cows which are both flesh-formers and milk-givers, and which produce a good stock. That is what I have been thinking is really the cause of the success of Cumberland farmers at least. They keep a very fine herd of Shorthorn cattle as a rule—not a large one. They milk their cows for about four years, and then they are sent to Edinburgh, and they have a very good stock coming into the place. They make from £18 to £25 a head on the cows that go out after they have been served for four or six years.

7127. What is the average size of a farm in Cumberland?—I believe the average size would come down to about 50 acres. I should think so, but I would not like to speak on that. The ordinary farm is from about 150 to 200 acres.

7128. Are there any small holdings in Cumberland?—There are some very small farms from about 30 to 50 acres. You must understand that in speaking of farming in Cumberland the whole of the farmers are working farmers almost, and even the large farmers as a rule mostly manage their own farms. I almost do not know of a farmer who keeps a manager.

7129. Have you any difficulty in obtaining labour?—I never had any difficulty, though I think the country is very short of labour, that is, it is not the fault of the men. It is the fault of the farmers, who do not employ them. I think a great deal more could be got out of the land than is done if they would employ more labour. I have a sort of opinion that as to every man who is worth his wage and can work for a reasonable wage, if a farmer has need for that man, and he can help on his farm, it will always pay him to employ him. The more men he can profitably employ on a farm the better. The great want with us is not having suitable accommodation to put them in. The system in Cumberland is now changed from what it used to be, that is, boarding all the men nearly in the houses. They want to keep them outside and have cottages provided. I do not think myself there would be any strong wish for small holdings in Cumberland, but there is a very strong wish to have better accommodation upon farms.

7130. You think that is the principal want?—That is the principal want.

7131. That is, better houses for the farm labourers?—Better houses for the farm labourer. I think it is the principal want. Of course I must not complain of my people when they provide me with five cottages, but I have to engage other eight or nine as best I can, and some of them are two miles away from my holding.

7132. You think it is very important that the labourer should have his cottage near the farm?—Certainly, and it should be a comfortable cottage. Most of the cottages are very bad. People say labourers are leaving the land, but I do not think they would leave the land at all if they had a suitable house to live in and were paid a reasonable wage.

7133. Do you think it is more important to provide cottages for labourers, and that there is a greater demand for them than for small holdings?—Yes. Speaking for my own men, I do not think they would be as well off as they are at present under my service. I do not think they want small holdings at all.

7134. (By Lord Barnard.) While on the subject of milk, I think I am right in saying that the fresh milk trade is extending very considerably, is it not?—Very considerably.

7135. A great deal of it, I suppose, goes to the east coast?—Yes.

7136. I say that because I was in Newcastle Station, waiting for a train, 10 days ago, and while there I read the names on an enormous quantity of milk cans, and saw that many of them came from Cumberland and Westmorland?—Yes, that is so.

7137. That is increasing?—Yes.

7138. Do you think I should be right in saying that probably one cause why the price of butter is bad in the district is in consequence of the enormous importation of Danish butter on the north-east coast?—I do not know that. It has always been the case about the month of May or June that the butter has been at a very low price, but I think that it is more regular now than it used to be in former years. Then that butter, which is not manipulated by butter blenders, is not as a rule so good, notwithstanding that it is very much improved. But you will find that some of the local butter-makers, the farmers I mean, are not able to compete with what I would call fine quality and things of that kind, and especially in the change from summer to winter feeding. That is the most critical time in connection with the making of butter. It is very seldom that you can get butter to keep more than two or three days that is made in the old conditions in a time of the year like that. In consequence of that they must take a bad price for it now, because the public taste has got up to such a point that they will not have it if they can help it in any way.

7139. You are well aware, of course, that the manufacture of butter in Denmark is largely carried on on scientific lines and is assisted by public instruction?—Yes.

7140. Then would you agree that there is scope for similar instruction now in England?—There is no doubt there is, very much so. It appears to me that the Danes have been able to make their butter so steadily that there never seems to be a mistake with them.

Mr. R.
Tinniswood.
11 June, 1907

Mr. R.
Tinniswood.
11 June, 1907

7141. Do you go to Offerton Farm at all?—No, I have not been to it, but I have been to Cockle Park.

7142. I will not trouble about that?—I have been to the Lancashire Dairy Farm.

7143. You have a very good class of stock, I know, in Cumberland and Westmorland?—We think so.

7144. Shorthorn stock?—Yes.

7145. And you consider that your farmers understand the breeding of stock pretty well?—I believe they do.

7146. I know they do as a matter of fact, but at the same time that is no reason why they should not try to go still one better?—No, by no means.

7147. There is always scope for more information?—Yes.

7148. I know you yourself are famed for the excellence of your farm. How many acres do you farm?—I have about 1,500 acres at present. The farm I live on, as to which I rather pride myself in keeping it in order, is Rosebank, the other is Inglewood Edge Farm, and is all grass. Then I have four gentlemen's parks of about 500 acres or more.

7149. But you are yourself a great believer in applying science to practice?—Yes.

7150. And improving your knowledge generally?—Yes.

7151. I know as a fact you have done it yourself with great success.—If I had had an opportunity when I was a young man I think I should have succeeded better than I have done. You must have knowledge first, I mean, to be able to apply improvements to your practice in farming. I had to learn a good deal of my knowledge in everything when I was a ploughboy.

7152. What I should like to ask you now is, are your neighbours and fellow farmers beginning to have the same opinion of this that you hold? Have you converted them to your views?—I think they were as good as I am, many of them, in point of management to the best of their knowledge but they did not adapt themselves to new methods, and I cannot see that any farmer farms to much good unless he makes a profit.

7153. Do the farmers in Cumberland begin to appreciate the value of improved scientific knowledge?—Yes, certainly they do.

7154. Then in fact your County Council ought not to stand still?—No, by no means.

7155. They ought to go on trying to give you increased knowledge, and you think that to do that, from your knowledge obtained as Chairman of the Farm Committee and as a member of the County Council, you ought to have more funds?—Yes, we ought to have more funds.

7156. In what way do you propose to extend the operations of the Farm School if you had more funds? Are you prepared to do anything in that way?—We could do more good to our own county if we had a larger school even. I admit, however, that I think we could do more still by having to some extent experiments more up to date. I am sure our manager is a very hard-worked man in his position, and if we could have some assistance for work in the same direction that Mr. Lawrence carries on I believe that we could do much more good. I would be much more inclined to make the farm still more experimental. You have to have gentlemen who are correct in their figures and everything in dealing with experiments. You must have that, and while it may be carried out on farms it cannot be carried out so exactly as it is under what I would call the manager's direct supervision.

7157. You want an increased staff, in fact?—Yes.

7158. Your staff is not sufficient?—No. I would be very much inclined to recommend what was asked Mr. Howard with regard to something being done for the sake of giving to elementary school teachers some knowledge of farming and gardening and horticulture in connection with their schools. I think that having school gardens would be very desirable for the purpose of inducing the young elementary boys to begin to have a knowledge of this work. A great want, I think, in connection with youths is that they do not seem to value the education, or at least they do not think what they are going to do, and in consequence they do not apply themselves as they ought to do. They want to take an interest, I think, in this, and I think a certain number would take an interest in it if there were school gardens attached to the elementary schools.

7159. Do you know any boys or their fathers who have

been through the Farm School? Do you know them personally?—Yes; and I have the pleasure of hearing from more than one that their son has got more good from being six months at Newton Rigg School than for two years at the elementary school in regard to applying the knowledge they have learned to what they were going to be and their calling and practice afterwards.

7160. I do not know whether it is your opinion that a boy ought to work on a farm before going to one of these schools?—Yes, I think that would be a very great help to him. I think it would not be wise to go before working on a farm for at least a couple of years.

7161. I suppose most of the farmers' sons in Cumberland and the sons of these small men only go to an elementary school, or do they go to secondary schools?—They only go to an elementary school; they begin to work very early, as to some, I think.

7162. I am sorry you have given up your additional experimental plots, but when you did so I am surprised you did not take up some other work of some kind in the county. However, you agree with what Mr. Howard said on the subject, do you?—Yes, I do generally with regard to that. As I said, I would rather concentrate more of our work on the farm and send an increased number of pupils there if we could do it.

7163. But you have dropped the one and not taken up the other, unfortunately?—I think Mr. Howard feels like us all. He is responsible for a good part of the educational work of the county, and we all, as being those who have to do with education, have been blamed for spending a great deal of money unnecessarily. I think it is most desirable that the secondary schools, or at least the higher elementary education, should be extended in the county, so that those who are brought up in connection with their homes and families should not go into a town or to large centres for schooling. I think what they gain they lose by losing their attachment to and interest in home life and farm work. If they could have a little higher elementary education in connection with agriculture, and have that brought home to them or brought near to their homes, that would be a great help to them in regard to their staying at home and becoming attached to the country.

7164. It would improve their intelligence, in fact?—Yes.

7165. (By Mr. Latham.) You spoke of your farm governors. What are they?—The farm governors are members, I think, all elected by the County Council. They are upon that body and generally they are elected because they have some connection with agriculture, or at least are willing to attend the meetings. The meeting is held at the Farm School. Some gentlemen might wish to attend, but find it very inconvenient, and consequently you elect gentlemen who are interested in farming and who are perhaps not living more than 20 or 30 miles away.

7166. Are they simply visitors, or have they anything to do with the management?—The governors have all to do with the management. They are the managers.

7167. They are responsible for both the working and the finance?—Yes.

7168. You were speaking just now of co-operative societies. To what extent are there co-operative societies in your district?—The only one I know of at present is the one I spoke of. There was one at Brampton, in the east, and one at Aspatria, in the west of Cumberland. I am a member of this one, and it does a very considerable business, at any rate in the way of buying manures and feeding stuffs and seeds, and other requirements such as sheep dips, &c. They buy them from the best sources, and also have a guarantee that there will be no mistake with regard to their purity. It has done a very great deal of good, formerly at least.

7169. What is the society composed of?—I think they are all farmers. It is a very large society. I know it is managed by a farmer as the Chairman. The secretary or treasurer is a veterinary surgeon, a very able man, and a great enthusiast in agricultural matters.

7170. I suppose these men who are members are shareholders?—They are all shareholders. They have to be shareholders, I think. I do not think you could buy these manures and stuffs unless you were a shareholder or unless you paid a higher price. I think it is in shares of £1, or it may be 5s. each; I do not know which. But I know that I hold a few shares in it. I believe they are £1 shares.

7171. It is carried on with great enthusiasm, is it?—It is, and I believe with very great care, and upon good business principles. I think they have undoubtedly

reduced the price of manures and also the cost of feeding stuffs, but in manures, especially when it was established.

7172. I understood you to say just now that you thought the farmers of the day were different men from what they used to be, through this farm education. Is that what you said?—I mean that they have as a rule a better education, and they can, I think, apply the improvements and the results of those experiments that have been carried out much better than was done formerly. The old farmers are very much prejudiced against being instructed by anyone who was not considered a practical farmer. The consequence was that the farmers formerly, I think, generally took their way of farming from custom and from observation; but now I think the farmers go upon more independent lines, and they know a great deal more about their business than they used to do.

7173. This Committee may take it that you consider the land of Cumberland is so much better farmed as the result of the scientific knowledge that the present race are getting. may it?—Yes, I think so. I think it is very much better farmed as to the major part of it.

7174. Now with regard to your butter-making not being a profitable occupation, is it good butter which is not profitable, or is it that the butter is made so badly that you cannot sell it?—I think it is always unfortunate for even the good butter-makers if they are in company with those who make bad butter. Very often if they go to market and they have both good and bad butter there is no doubt that, seeing there is no grading, as you might call it, and that it is not graded, you have to sell perhaps your better butter at a lower price than you would do if it had been all good butter.

7175. If all the butter of England at the present time was high class butter, and of high quality. do you not think there would be a good trade for it?—Yes, I think there would.

7176. We import an enormous quantity of butter at the present day, which is worse than our own in my opinion. I consider our English butter is very much preferable, and do not you think that since you have had the dairy schools and better dairy teaching your butter has improved in quality, and that the trade is very much better?—Yes.

7177. And that our own butter is better?—Yes.

7178. I am speaking of the English butter?—It is very much improved, but seeing that there is nothing in the way of what you might call inspection, and no grading of butter, and that there are no regulations applied to the making of butter, such as there are in Denmark, of course it is all left to the individual farmer and his wife, and it is not everyone that complies with the best way of making butter yet. I think that has a great tendency to keep the price of butter low, as well as the character of it.

7179. That answers my question to some extent. If this butter could all be made on new scientific principles, you consider there would be a fair trade for it?—Yes.

7180. Your County Council, in common with all the County Councils of England, is in putting the improvement of the butter industry in the very first rank, is it not?—Yes.

7181. It was virtually a lost industry, but there has been a marked improvement in the butter trade?—Yes, perhaps there has not been the improvement you would expect in the butter trade, but there is an improvement undoubtedly in it, though not to the extent you would like to see.

7182. You were speaking just now of good milk. Is not there almost as much bad milk as there is bad butter?—I do not understand what you mean when you say that.

7183. We know as well as possible there has been a very great complaint, and I think great feeling against the milk standard. Most people think that the milk standard has been too high?—I do not think that it is too high at 3 per cent. of butter fat.

7184. Nor do I, but some people do?—But I do think that the better way would be, as is done now I think by some corporations and others, to issue leaflets, or anything you can, to instruct farmers as to the best way of keeping up the quality of the milk.

7185. That leads me to the next question now, that there is as much education required in the keeping up of good milk as there is in regard to good butter?—Yes.

7186. And that might be done at very much the sort of place you are advocating at the present time?—Yes; it is very important that it should be kept up. When it

gets below that it is bad, but I am glad to say that at the present time the Board of Agriculture have recognised the fact that farmers were formerly liable to be proceeded against, and I am sure many innocent farmers in former times have suffered innocently. The milk was pure but of poor quality. I think the Board of Agriculture have done a very great service in seeing that the test was even applied to the cow, so that the man might not be punished when he was quite innocent and had no intention of supplying poor milk; and on the other hand I think everything ought to be done to bring up the quality of the milk to the standard.

7187. I think you told Lord Barnard a few moments ago that you considered that this scientific or better education of the farmer tended to a much larger yield from the land. Was that so? Did you say that a man who was thoroughly well educated in his business could produce a greater return from the land?—Yes, I do say so.

7188. That is one of the most important questions we have ever had answered in this room, I consider?—I think that that is so. I think you cannot educate the farmer too much, and seeing that his means are so small, speaking merely of Cumberland and of working farmers, you cannot educate them too much. He must have knowledge in the first place to apply to his business, and he will do his business a great deal better if you do not spoil him with what I will call too much of town life, or ideas about going to where there is more to be seen and spent than is to be either done or made.

7189. Still on this particular question, seeing that I am a farmer myself I suppose you mean that the means of producing this greater yield are not too large, but you would not encourage a man to go to too great an outlay in producing this extra yield. It must all be done for a profit?—Yes, certainly.

7190. I suppose you will agree with me there is a vast deal of money thrown away often through ignorance in applying wrong manures to the right place and right manures to the wrong place?—Yes.

7191. That sort of education is likely to be very much better if such education could be procured from farms, and it is better if it is obtained from educational bodies similar to those that you represent?—Yes. There is nothing better for farmers than to distribute information bearing upon what I would consider practical successful farming. Speaking from what I have felt in connection with the history of the Royal Agricultural Society, the former practice of giving prizes to farmers was in my opinion one of the best kinds of work they did in the country, because of the information it spread amongst the farmers. I may say I have heard myself that it was of more value to read the reports on those farms than all the rest that was published in the Society's *Journal*, and I hold to that principle yet. Speaking for myself, in connection with my own farm, I have an experimental plot, and Professor Gilchrist came over and gave a lecture on the result of it on my farm, which was very largely attended—by about 100 farmers, I think, and gentlemen. The interest in that was very great. Last week, or the week before, I had a visit from the Essex Dairy Farmers, and the interchange of thought and ideas about farming and farm management I believe to have been very beneficial, and that visit has been very much commented on with regard to its usefulness to agriculture for both counties.

7192. Now with regard to the small holdings that you have given us some very good evidence on, do you think that there is any anxiety in your county amongst the small men to get land?—I do not think there is. You see, there is a considerable number of small farms already, and there is no difficulty with regard to that for a man who has got any means I think. But there seem to be more people who can take a 50-acre or an 80-acre farm than any other farm in Cumberland. These small farmers come very much from the farm labourers. We pay them fairly good wages, and many of them become small farmers. I was told just on Saturday by a neighbouring farmer of a case of a farm servant which shows that these men can manage to get a small farm. He said his boy farm servant came to him seven years ago. He engaged him and gave him his board and £14 a year for the first year. That went on for seven years, and in the seventh year he had £34 a year with his board. He asked him this very Whitsuntide what amount of money he had saved, and he said he had now £200 in the bank, and that was due to the example of his master and the interest he took in him. He told him when he paid him his first half-year's wage, "After you have got your clothes, if you put the rest in the bank it will be a good thing for you"; and that was the result. He told me that just the other day.

Mr. R.
Tinniswood
11 June, 1907

Mr. R.
Tinniswood.
—
11 June, 1907
—

7193. And he is not a small holder?—When he marries and gets a wife like himself, he can now become, no doubt a very successful farmer.

7194. But he did not get that as a small farmer?—No.

7195. You stated just now that you thought the majority of the farmers get their education from the elementary schools?—Yes, they do.

7196. If they move from them, where do they move to?—After they are moved from the elementary schools do you mean?

7197. Yes.—Of course what Newton Rigg supplies is very small, but the majority of the farmers do send their sons to secondary schools in Carlisle and the other towns in the county. But I am speaking now of the really hard working small farmer with a large family. He very seldom sends his boys to any other school than the elementary school.

7198. Then with regard to the secondary schools, you made the remark, I think, that they could get more information from your school than they could get from the secondary schools?—I have said that was what I had been told by a farmer or two.

7199. Would it not be knowledge of a very different character?—I think the knowledge is supplied in a different way, and the same with regard to observation. Then I may say that they see the benefit of discipline and method in applying their knowledge to the work they were doing. There is not so much method, perhaps, about the farm as there might be, but I think they were very much improved by seeing that things had to be done punctually and methodically, and then of course having the benefit of lectures by the manager upon animals, and the application of manures to soils, and with regard to their handling of the cows and the sheep upon the farm, I think it was demonstrated to them very much better than it could have been done to them in any secondary school. No doubt the education they had got before they came there was a very great help to them in enabling them to profit by this sort of work.

7200. You think that the two teachings are separate necessarily?—Yes, in a sense they are. But how you could link on the agricultural education to the secondary schools, it would be difficult to say.

7201. You would not advocate an agricultural side to these secondary schools, would you?—No; I would only in a very elementary fashion do so. I think that a knowledge of agricultural chemistry and also of practical engineering is very desirable in connection with farm labourers and men at present.

7202. At what age do you expect to get these young men to come to your school?—I should think they very seldom come under 16—I should think from 16 to 28. There are some of them, not many, I think, of 16 to 18 years of age.

7203. How long do you generally keep them—how long is your course?—Only six months.

7204. Provided you get a young man who wishes to have a longer course, can he have it. I mean if he takes an interest in what he is doing and wishes to stay a longer time, would you keep him?—I do not think we should unless he was prepared to pay an extra fee, and take the course the following year.

7205. Of course six months is very little time to get much science in, is it not?—It is not long, but I suppose

it is perhaps long enough for an ordinary farmer. He ought to get, what I think for an ordinary farm, is enough. If he is going to be a land agent, it is different perhaps.

7206. You consider that the ordinary farmer, if he is going to make a living by his business, will get as much as will do him any good in the six months' training?—I think if he is to be a successful farmer he ought to get it in six months.

7207. (By Professor Middleton.) Just to continue that question; you would agree that it would be only possible to give him what he required in six months if he already knew something about farming and had been on a farm?—Yes, that is so.

7208. You could not take a schoolboy therefore from school, and in six months give him the sort of knowledge that a farmer wants to have?—He could get what I should consider just the elementary part of it. His business would give him the rest of the education.

7209. But if he had had no previous knowledge of the business, and had seen nothing of a farm, you do not think that he could possibly learn much that would be of great use to him in farming in six months' time?—No, indeed I should not think so. He would learn, it might be, a great deal. It depends very much on the kind of man. All our Newton Rigg pupils have had practical experience on a farm before coming.

7210. Have you had experimental plots at your farm for a number of years?—Yes.

7211. You just now alluded to the fact that you had some neighbouring farmers to see them?—Yes.

7212. Have your neighbours been taking an interest generally in this experimental work?—Only through the publication of our reports, and on the occasion when Professor Gilchrist came and gave a lecture of course that brought them there. But they do not come to see the plots excepting occasionally.

7213. There is nobody to show them round, I suppose?—No; and there is no time fixed for that. But I have farmer friends coming to see me, and I naturally take them round; but they read the reports, and of course they get their information from them.

7214. What is it in the experiments that has been most interesting to these men. Do you remember what subject it was that was most interesting them?—I think what has interested them most in regard to the plots, has been the application of manures to the different crops. They had been able to see how they could grow the best swedes especially. I think they take perhaps most interest in the result of growing swedes and the manures that are applied to them; and then of course that has been followed up by the crops that come after them. But Mr. Lawrence perhaps could speak more correctly as to the results of these plots. I believe that the greatest interest has been taken in the application of the manures to the swede crops.

7215. There are two sorts of manuring. There is direct manuring, and also sheep feeding on your land?—Yes.

7216. Are Cumberland farmers more interested in sheep feeding or manures?—A great deal more in the manures because they would take their own way in feeding sheep and pasturing them. That was interesting to a certain number, but the manure was the principal thing.

Mr. W. T. LAWRENCE, called and examined.

Mr. W. T.
Lawrence.

7217. You are the manager of the Newton Rigg Farm School?—Yes.

7218. Would you give the Committee an account of what work is done at the school during the summer and during the winter?—Our dairy has accommodation for eight pupils to work separately—that is, there are eight churrs and the other appliances that go with the churns. So that we have eight pupils during the spring for two months, and then again during the summer, and then again during the autumn. We have three courses in the year for girls. Eight pupils attend and go through their dairy course, which comprises the ordinary work that is carried on in Cumberland and a little beyond that, with a view to encouraging them to extend their dairy work

in lines a little more profitable than merely butter making, such as cream cheese making, and clotted cream making, and cheddar cheese making, with a view to encouraging them during this time of the year, for instance, when there is a glut of milk, to direct the milk into a more profitable channel than merely making it into butter. Then there is poultry, and the rearing of poultry, and milk testing, and we even go to the extent of teaching them something about the feeding of dairy cows in winter time as well as summer. Of course they practice milking and calf rearing, and, speaking generally, we may say that one tries to teach them that which a woman engages in in north country farming, because in the small farms of Cumberland the woman is a very important factor in the

Mr. W. T.
Lawrence.

11 June, 1907

work of the farm. She practically undertakes the whole of the dairy work and the whole of the calf rearing, and the rearing of very young stock up to six months old at any rate. Frequently, of course, she does other work besides, and she does the whole of the poultry work and marketing, and so forth. We just try to equip them for the work they would have to do so that it may not be done in a sort of slipshod, anyhow sort of way. We try to let them see the way of doing the work and the necessity for doing it in such a way that it will realise the best market price. That is really our work with the girls.

7219. What age are they?—We do not take girls below 15. Fifteen is the minimum limit for girls, but then we take them up to any age beyond that.

7220. What is the average age?—I should think the average age is about 17, or from 17 to 18.

7221. Are they the daughters of farmers?—Yes, and of farm labourers, and the better class of cowmen. They frequently send their daughters, and they are very suitable girls for making good dairy maids. They have been used to hard work generally, for that is the work that they have to do. Among the small farmers in Westmorland and Cumberland many of them are blest with very large families, as many as 12 or 13, and, of course, they cannot all find occupation at home, and they are glad to go out as dairy maids. We try to equip them for their work, and we have got our dairy maids scattered all over England and some parts of Scotland, and it is rather pleasant to feel that where we have sent one girl we almost always have applications for others when she gets married or leaves.

7222. You say the daughter of a small farmer becomes a dairy maid?—Yes, often.

7223. Are the girls taught any cooking?—No.

7224. Nothing but their farm work?—No; nothing but their farm work.

7225. And all practical work?—All practical work. They have oral lessons in the principals of dairy work every afternoon except on the cheese making days—that is, on butter-making days, the morning being sufficient for the making of butter.

7226. But no chemistry?—No.

7227. No science?—No; but I should not say no science, really, because these afternoon lessons are really in dairy science.

7228. But all bearing directly upon their work?—Yes.

7229. You say that you have three courses for girls, each of eight weeks?—Yes.

7230. One course is sufficient?—In the case of a girl of 15 or just over 15, if we think that she is hardly showing up at the end of her course as well as we might have expected, I frequently write a private letter to the parents, and say, "I would advise you to apply to the Governors for another course for your daughter, because she would benefit by it."

7231. And she gets another course?—Yes.

7232. Are these pupils all resident?—Yes.

7233. You have no outsiders, have you?—Yes, we have occasionally day pupils. For instance, we have numbers of young women coming just for cheese making. A young woman will come twice a week for cheddar cheese making, or for butter making. If they live close at hand and can cycle over they can come as day pupils and have a course in butter or cheese making, and so on.

7234. Do they get the same course as the resident students?—Not quite. They come for a special purpose and the course is useful for giving them what they want.

7235. They are intermittent?—Yes.

7236. They do not attend regularly?—They attend their lessons regularly, those particular lessons, that is, but they do not take the whole curriculum of the class.

7237. Whereas the resident students take the whole course?—Yes.

7238. And for the resident students the course is eight weeks?—Yes.

7239. Would you like to increase the number that you could take, and would it be more for the benefit of the counties, both Cumberland and Westmorland?—It is not often we have to refuse pupils on account of lack of accommodation, but I believe it is getting a little more that way now. For instance, in the last two years we have never had a vacant place, and occasionally we have had to say we have not room, but that does not very often happen, and

if one judged by that one would say the accommodation is nearly what is demanded at the present time.

7240. The demand might increase, of course?—Yes, that might be so, and of course that shuts us out from taking outsiders from other counties. We were able occasionally to take one or two from other counties, but that is practically not so now.

7241. It is limited to the two counties of Westmorland and Cumberland?—Yes.

7242. Have you anything to add about the girls?—I do not think so.

7243. Do you give them a certificate at the end of the course?—If they merit it. That is left entirely to the examiner. The examiner is the Professor of Agriculture at the Armstrong College.

7244. He comes down regularly to examine, does he?—Not the girls always, but occasionally. Sometimes he comes for them, but with the boys he always comes.

7245. For the girls there is no regular examination, is there?—Yes, it is regular. But there is a paper examination at the end of each course, and one of the governors superintends the examination. The examiner awards the marks, and whatever he fixes as his standard mark, then all above that he would recommend for having merit certificates, and those who fall below that do not get the merit certificate. It is not a certificate merely of attendance.

7246. It is a merit certificate?—Yes. Their teachers' daily register is sent up to enable him to judge of the practical work. I may say that after the first fortnight, which one may call the initiatory period, when they are feeling their way, the dairy teacher gives marks for the pupils, lesson by lesson, for the work that they have done, just the same as if it were a practical examination; and that register is sent up with the marks for each pupil, and so the examiner is able at the end to combine the practical marks that they obtain in the school and the marks obtained in the written examination that he puts, and he takes the whole work as much as possible in that way.

7247. That is at the end of the eight weeks' course?—Yes.

7248. Is there a staff of instructors for this dairy teaching?—Practically with the girls it is just a dairy teacher.

7249. One dairy teacher?—Yes. I give each class of girls about half a dozen lessons myself. That is all. That is teaching bearing upon the feeding of cattle, and the work generally in connection with the cows and calf feeding. But I may say that every day, twice a day, the pupils have to attend to the cows, and rearing and feeding the calves, and so forth. That is a department of work that never enters into the hands of any of the farm hands at all. The whole of our calves are reared entirely by myself and the pupils, because we think it is an important thing, and the foundation of our stock. We think that those who are engaged in that work should be the ones that should do the work when they are taken in.

7250. It is all done under the direction of the dairy teacher, is it?—No; the calf rearing lessons I give them, and the lessons on the feeding of stock. With the exception of that, all the other work falls to the day teacher.

7251. But who gives the teaching in the feeding of the calves?—I give that.

7252. Then the work is distributed between you and the dairy teacher?—Yes, a very small part of it falls to me.

7253. The main part of it falls on the teacher?—Yes.

7254. Now we can go to the boys?—As to the lads the limit of age for them is 16. We take no lad under 16, and we do not care to have a boy straight from school. We have occasionally had them straight from school, but we do not care about it. We like a boy to have had, if possible, two years on a farm. It is quite true he has forgotten some arithmetic and has become more clumsy in his composition, but he soon picks that up again. But that disadvantage is far outweighed by the keenness that he shows with regard to the work we are doing, and in regard to the actual farming, and our course is so arranged that we try to give science lessons as thoroughly as possible, but at the same time we do not wander one single inch one way or the other out of the line of direct application to the actual farm work. For instance, in chemistry lessons we should not think of teaching anything but concerning the elements that enter into agriculture, and only the compounds of those elements that directly bear upon soils and manures, and so forth, on the farm, and in that way

7254a

7254b

Mr. W. T.
Lawrence.
11 June, 1907

we are able to narrow it down and make the best of the time. In botany, for instance—if one may give it so good a name as that—they have a course of lessons on how plants live and grow, and then they take the characteristics of the different crops and they just learn the natural orders to which the crops belong, and the weeds probably belonging to the same class. I mean to say that although the foundation of their knowledge of plant life and the growth of crops is based upon sound botanical principles and knowledge, yet we do not go a bit beyond what is directly applicable to the farm itself. I do not know whether you are interested in the course they follow, but it practically comes to this: that for the first month we are doing nothing but chemistry and mensuration. That is our day. Our day is cut up something in this way: the boys are up at half past five in the morning, and the girls the same in

7254c fact. The first work is the milking. The boys engage in the milking. We have more boys than girls—we have 10 boys. We are limited as to the girls by the accommodation of our dairy, and in regard to our boys we are limited by our bedroom accommodation. We could accommodate 10 boys in the bedrooms. Five of the boys would be milking, and five of them would be helping the cowman foddering the cattle. Those at the milking would attend to the separating, and also would attend to the feeding of the calves. Then that takes the work up to breakfast time. After breakfast, from 9 till 12, it is class-room work entirely. There it is that they get the chemistry lessons, or whatever the lesson may be, in farm science for two hours. Then the third hour is given to figures. That is they take up farm mensuration, and, alluding to a remark I heard just now made by Mr. Tinniswood, they told him that the boy had learnt more in the six months at Newton Rigg School than he learnt elsewhere in a much longer time. That meant that the boy showed more improvement in composition and in expressing himself, and in accuracy of figures, and in the application of figures. He did that better, and no doubt that may be the case, because the boy is keen to see the bearing of the thing. It is astonishing how in the six months they do rub up in their ordinary elementary education, and improve in their writing and spelling and composition and figuring. I think they improve immensely. They get a good deal of practice, of course. But that is not the object of the place. It is to give them scientific knowledge such as will help them in farming. That is, roughly speaking, one may say, what we try to give them, and it is what they cannot learn at home. We do not pretend to teach them ploughing, or to teach them what they can learn better at home, and we do not wish to make them break their connection with the farm. Therefore we take them in in the winter time, and they can employ on the farm at home the science that will help them. We endeavour to give to those who would never get it in any other way farm science—we simply get the boy and give him such knowledge as that.

7255. Your object is to prepare him for the farm?—The boy has to go back again to the farm and make use of the education that he has got with us. Then every afternoon they are out on the fields. There are class room lessons in the morning and field lessons in the afternoon. The majority of the boys go back and work on the farms.

7256. What is the staff of teachers for the boys besides yourself?—There is no one else, except twice a week when making butter, and then the dairy teacher looks after them.

7257. Are the boys doing dairying too?—Yes, they do it twice a week. They do it in winter.

7258. Do they get that training from the dairy teacher?—Yes.

7259. From the woman?—Yes.

7260. I see you have given in your proof their curriculum in detail?—Yes.

7261. Therefore I shall not ask you to go into that. Then the Professor of Agriculture from Armstrong College also holds an examination for the boys?—Yes, and he visits. He not only holds the written examination at the end of the course, but he comes before the end of the course and gives them a *vis à voce* examination, and takes them one at a time through the stock, and so on.

7262. He always attends?—Yes, that has been the practice.

7263. And also sets the papers?—Yes.

7264. What is your explanation with regard to the way in which the boys come to you, as to their having been

turned out before?—We may get a boy who has done chemistry in a secondary school, going from an elementary school to the secondary school, and if he has done some chemistry, not necessarily having specialised for agricultural work, but general inorganic chemistry, it is a very great help to him, and I might say that that is the direction in which, I think, education could be of benefit to agriculture in the secondary schools—not teaching the principles of agriculture so much, but teaching mensuration and occasionally the sound practical basis of chemistry and elementary botany. That is elementary science pure and simple without any direct application of it to agriculture. That would very much enable him to understand what we are doing when he comes to Newton Rigg. The majority of the boys come straight from the elementary schools—they have passed standard vii. and that is quite enough for our purpose so far as actual elementary attainments are concerned.

7265. Have you a school garden?—Yes.

7266. I see you pay a good deal of attention to book-keeping?—Yes. That has turned out to be of use to many too. Several of our pupils have been farm servants, young men of 25, or from that to 30, and they have come up for the six months in winter. In Cumberland that means from the 11th November—that is hiring time. On several occasions such young fellows have come up for the winter course to Newton Rigg, and I have now in my mind four who are managers of home farms—one in Northamptonshire, one in Somersetshire, another one in Ireland, and another one in Staffordshire or Cheshire. They are managing farms and doing it very successfully, and they could not have taken those places if they had not had some lessons in book-keeping, because they have to keep the books and keep them properly.

7267. Do the sons of farm labourers also come to your schools?—No, not often.

7268. They are mostly the sons of farmers, are they?—Yes; the sons of farm labourers would be those few young fellows who have grown up, and perhaps they see the value of it themselves and have come on their own initiative. They have not been sent by their fathers, I mean. We occasionally get them in that way, and very many of the farmers in Cumberland send out their sons as farm servants. For instance, when a boy attains the age of 16 he goes to the ploughing on his father's farm, and works till he is worth a pretty fair wage, and then another son has come up to take his place, and he is hired. He goes and hires himself as a farm servant. Now that boy is the best class of boy and has more of the farmer style about him; he has gathered more from his parents in their own farm than might be the case otherwise. That is the sort of boy who at the age of 22 or 25 thinks "I will go to Newton Rigg and pick up what I can there—it may be of use to me," and probably he does find it of use to him.

7269. That is the boy who comes on his own initiative to you?—Yes.

7270. I suppose you are of the opinion that it would be desirable to have an institution like yours in every county?—Or in every two counties. It just depends. Of course our two counties of Westmorland and Cumberland are sparsely populated. You might take together Herefordshire and Monmouthshire, or Hereford and Brecon, or Hereford and Worcester, or Shropshire, or any two counties at a time. It would be ample with one.

7271. There are many counties which would be locally benefited by such schools as this?—Yes. It seems to me the only way of actually benefiting the working farmer is to give him the benefit of information that may be useful to him, and to do that in the way that we are doing it. We have pupils now and then who have come in with the intention of going on further, to an agricultural college, to the Armstrong College, or some other one, with a view of completing their education and preparing for their examination as land agents or surveyors, and who will probably go into a land agent's office or that sort of thing. We cannot exclude them, and they pay their full fees as a rule. They do not come merely on the £4 charged the ordinary Cumberland boy for the time he is there. They will probably pay their 10s. a week.

7272. Those boys come with the object of becoming land agents as a rule?—Yes. We do not get more, perhaps, than one in a term of that kind—that is, one out of ten may be coming with that intention.

7273. And I suppose as a rule he is better educated?—Yes, he is almost sure to have come from a grammar school. Of course as a rule he knows less of the practical

work of the farm at the same time, but he probably picks it up more quickly than he would in an ordinary way from association with the other boys.

7274. Your boys as a rule are, I suppose, hard-working boys?—Yes.

7275. We know in Cumberland they are diligent?—Yes, generally speaking they are diligent. We look after them. We do not give them much opportunity for being idle. They actually live on the premises, and that is the whole secret of success—that I have got the whole control of them there during preparation time in the evening. I have a great deal of correspondence with the farmers in the two counties—perhaps a larger correspondence than most people would imagine falls to my lot, and I can very well engage in that and sit with the boys while they are at preparation work. That is the secret of the whole thing. They get an hour and a half's preparation every evening, and the boys have the master with them that they had in the course of the day for their lessons. We drive them hard, but they increase in weight during the time they are there, and in growth, so that it does not seem to hurt them, and I have no doubt they put in more time than they would in the ordinary way in an agricultural college; I do not see how it could be done there very well, and for that reason the most is made of their time.

7276. I suppose you regret that those field experiments were given up?—I cannot say that I do very much, for the reason that the whole superintendence devolved on me, and the majority of the farmers on whose land they occurred were getting rather tired of them. The farmers were keen on them at first and while the plots showed a good deal of difference and seemed to be showing more and more to be learned from them. Then there is the change of tenants. If we have plots on a farm and it changes hands, the next tenant may not care to continue them. Then one difficulty may be the wife, who cannot see that it is putting a penny into the husband's pocket, and she gives you the length of her tongue, and that is not always pleasant. Therefore altogether I cannot say that I regret it very much. But I may say that the plots really are still giving us results that seem to be of real educational value. They are meadow-land plots on many kinds of soil. They have been carried on continuously for fourteen years and practically it has come to this now as to what can be done with those plots. The longer the experimental plots are carried on with the same treatment, such as the Rothamsted ones, the more beneficial is the teaching that they give and the lessons that you learn from them. But still at the same time for all practical purposes I think that meadow manuring as taught us by these plots would give us very little more to learn if they were carried on another 14 years than they have taught us in the past 14 years. Therefore, considering the difficulty of working them now with those obstacles in the way, and considering that they have been carried on now for so long a time, I cannot say that I feel very seriously the loss of it. But on the peaty soils we continue them because they continue to show still a great deal of unsuspected results. Those are continued: I do not think the Committee have given up those plots that are still of most educational value.

7277. But you will admit that, well conducted, they have great educational value?—Yes, I think so.

7278. It is only a question, of course, of having the means for carrying them on properly?—Yes. One thing that influenced the Committee was the fact that now they have a farm in their own hands at Newton Rigg and experiments can be carried on there. That they had not in their possession when they first commenced experiments. The experiments were devised by the Professor of Agriculture of the Durham College of Science then, Dr. Somerville, and they have been modified since by Professors Middleton and Gilchrist, who succeeded Dr. Somerville. They were devised and then modified by those gentlemen. They come, of course, from time to time to inspect them and so forth, and they are made to fit in with similar experiments originating in and carried out in Northumberland and Durham. If the same experiments were continued out, the more definite would be their teaching, and if anything is to be regretted in giving them up it is more the fact that you have taken away one of the links and have reduced, to some extent, all its operations.

7279. It is the same experiment?—Yes, exactly; because we have in Cumberland probably a greater variety of soils than in any other county in England, but because of the large number of geological formations that crop up, and because of the ups and downs of the county, a great variety is given in that way.

7280. (By Lord Barnard.) You have ten lads every year pass through the school, I understand?—Yes.

7281. Who selects those lads?—The Committee and Governors. They apply to the Secretary. He is also the Secretary to the Governors. An application form is sent to them, on which questions are asked as to the age and what he intends to be, and whether he is an applicant for an assisted studentship. Possibly he may say no, and then of course he has to pay his ten shillings a week. If he says yes, then his case is taken into consideration at the next Governors' meeting, which is once a month at Newton Rigg, and if he is the son of a tenant farmer, or a working farmer, there is no hesitation in awarding him an assisted scholarship. The grant is £4. The Governors actually select the candidates.

7282. Are there at present more candidates than vacancies?—There are rather more, but there is not much excess in that way. But we are always full now.

7283. Do you think there is any probability or any possibility of an increased number being accommodated?—I do not think so.

7284. Or requiring accommodation, perhaps I should say?—There is that possibility. But we seem very nearly to have the accommodation that is really demanded by the two counties at present. If you put the number down that we have every year, in a few years that makes a good sprinkling throughout the counties. For instance, there are 223 girls, pupils who have passed through the schools in eleven years, and 110 boys. Scattered through the two counties, that is a fair sprinkling of Newton Rigg trained pupils.

7285. You think, then, that there is no likelihood of a demand for increasing the number of lads—I am talking of boys now?—I think the tendency is in that direction. There seems to be no great rush at present.

7286. Are girls selected in the same way?—Yes.

7287. Are you always full now?—We have for the past two years been full.

7288. Previously you were not always full, were you?—We were with boys. Every winter we have been full of boys except once. So that, practically, we may say we have always been full of boys. But in the matter of girls, in the present course that began yesterday, for instance, that is our summer course, there has been some difficulty, up till two years ago, because, of course, it is the time of the year when the girls are useful at home in haywork and such-like.

7889. Then on the subject of finance. What is the cost, taking a lad first? What is he out of pocket, not counting, of course, what he is out of wages, but what does it cost him? Did I understand you to say £4?—£4 and his travelling expenses and a little for incidental expenses, such as half a crown for note books, and something like, we will say, ten shillings for his laundry work. That is all.

7890. Do you ever hear of lads going away because they find any difficulties in that way?—No, we have never heard of that.

7891. Without suggesting that they are wealthy, the agricultural classes are not badly off, in fact, are they, in Cumberland and Westmorland?—I do not think so. They are not badly off.

7892. They are not poor?—No.

7293. Then, I think, you stated that the half fee was £4?—That is so.

7294. Then does the county pay the other half?—The county has a scholarship fund, which is divided into scholarships for lads going from a secondary school to a college of university rank and scholarships from elementary schools to grammar schools; and then there is a sum of money, which must not exceed £100, from which the scholarship may be drawn for paying the fees of girls and boys coming to Newton Rigg.

7295. What you have said as to numbers of boys and vacancies and so on, as well as the fees, applies equally to the girls, does it?—The girls that have applied for a studentship have always obtained it. The £4 is the price, and the £4 for them pays the whole.

7296. It costs them less then?—It costs actually nothing except these little incidentals.

7297. What are the day pupils paying?—They pay 2s. 6d. a week. There is no grant ever given to them.

7298. Is there any limit to the number that you take?—Yes. We cannot take a day pupil if we have our full

Mr. W. T.
Laurence.

11 June, 1907

Mr. W. T. Lawrence. accommodation of resident pupils. We cannot take more than two or three day pupils at a time.

11 June, 1907 7299. Who does the housework?—We have two maid servants.

7300. The students do not do it?—No. The girls are supposed to keep their bedrooms tidy and make their beds, but beyond that they do nothing.

7301. Do you ever have any question, or have you ever had any difficulties as to discipline?—No, with the girls there is never a shadow of difficulty at all.

7302. But with young men of twenty-four, I should have thought it would be different?—One has to read the "Riot Act" now and then, but they have always succumbed to moral suasion. There is only one case on record of a lad using bad language, and I expelled him there and then on the spot on my own responsibility, because I thought it was one of those cases that might give the place a bad name, but beyond that we have never had any difficulty.

7303. Then with regard to the results of the teaching. I will test it by a question which has been put to other witnesses here. When a lad leaves school would he have sufficient chemical knowledge to understand and appreciate an analysis of manure?—Yes, quite that.

7304. Am I right in thinking that is the sort of information you wish to give him?—That is the endeavour.

7305. So that he should understand an analysis better than a lad who had not been to school, and had not had the teaching?—Quite so.

7306. What proportion of the pupils, both male and female, come from the two counties—are they mostly from Cumberland?—Three-fourths come from Cumberland and one-fourth from Westmorland, and that is the proportion in which the Governors are represented, and the £100 that you heard of from Mr. Howard, that Westmorland contributes, was supposed to be a fourth of the expenses, but it is not quite that.

7307. I should have thought that the agricultural population of the two counties was more nearly half and half, or more nearly equal?—No. Westmorland was not prepared to go beyond that.

7308. But the population. I say?—No, because in the matter of what was called "whisky money," it was something like £2,000 for Westmorland and over £6,000 for Cumberland.

7309. But I should have thought that the agricultural populations of Cumberland and Westmorland were very nearly equal?—No, nothing like it. I should think the agricultural population of Cumberland is three times what it is in Westmorland.

7310. But there seems to be a great number of small farmers in the Kirkby Stephen district?—Yes, but still the area of Cumberland is so great in comparison.

7311. But a great part of that area is devoted to mining, is it not?—No, not when you come to area. You do not get it so much in that.

7312. What I was trying to arrive at was this, whether you think there is sufficient accommodation for the small farmer, for what we call, and what I daresay you call, too, the dale farmer who lives in the dales and sells stock and milk. Is there sufficient accommodation for that class of men from Westmorland?—The only way we get at that is by application or demand. There is no necessity for refusing.

7313. Do you think it is possible if the existence of facilities at Newton Rigg were better known there would be greater advantage taken of the school, particularly if the results were more known?—I do not think so amongst the class of farmers that you refer to, because it passes through my mind now that the pupils we have had from Westmorland have been for the most part from the lower lying districts, where there are tillage farms more or less mixed.

7314. Would you then agree with me in saying that the present college facilities which already exist are not extended up into the dales?—I should think it lies more in this, that in simple sheep farming they feel less ignorance—they feel that there is less for them to learn, applying to their work. For instance, in the matter of food stuffs and in the matter of artificial manures and such things as that they are not bothered so much in the fell farming, and so they do not see the necessity so much for sending their boys to the school.

7315. Take the district of Alston, that is in your county, is it not?—Yes,

7316. There again you have a large number of fell farmers?—Yes.

7317. Surely there is scope for extending your attentions in that district?—We have only had two lads from the Alston district during the whole time.

7318. That, I think, confirms my suspicion, and I will tell you why I ask these questions. It is because it strikes me that in two agricultural counties like Westmorland and Cumberland to only put 10 pupils through a simple course like this is not doing all that might be done?—It seems little, but in the course of a few years it permeates into a very large proportion of them.

7319. What proportion of your farm is arable—how many acres are arable?—Fifty.

7320. And the rest is all grass, is it, or is it mostly meadow?—Meadow and pasture. But, of course, that does not really represent the grazing ground, because being farmed on a five-course rotation, we have always got 20 acres in first and second year seeds.

7321. Supposing you have a clever boy coming to your school, the son of one of the small farmers or labourers or hinds (I know the class of man coming to the school and meet them occasionally), the man who, when he wants to marry, saves money to set up a farm for himself—supposing you have an exceptionally clever boy at your school, I rather gather you do not encourage him to go on and get further education?—It all depends on how he stands in the examination. If, at the examination held by the Armstrong College Professor of Agriculture, the lad stands at the top of the Cumberland boys and another lad stands at the top of the Westmorland boys that come in, he has the first offer of the scholarship that is available at Armstrong's College.

7322. But supposing there are two?—The second one has to go without.

7323. Do you think that is a good system from a national point of view?—I am rather opposed to the majority of people who urge that point about sending the boys beyond that. My own personal feeling is that the best results that can accrue from teaching them at the Farm School are shewn when they go back to the farm and work as practical farmers.

7324. Then if there are exceptionally clever lads at Newton Rigg they do not want them—that is, boys capable of having their agricultural intelligence further developed—you are not prepared to do that at Newton Rigg. You do not think it is part of the scope and aim of the College?—It is one in seven every year. There are only seven Cumberland boys every year, and there is an opportunity for one in seven, and that is not a bad proportion.

7325. But that is a limited number. You might have none in one year and two or three in another, and only one of those can take it. There are no other means in the county of Cumberland. The educational ladder does not exist practically in practical work?—No.

7326. There is but one scholarship and if he cannot get that he has to go without?—Yes; but I believe that does not come quite under my purview. I think that there is still another scholarship that comes under a different class, a higher scholarship of £50, one of which is available at one of the agricultural colleges, or at Owens College. I think he can take the agricultural side of it if he likes and get on with a scholarship such as that, but it is the business of the whole county whether they come to Newton Rigg or not.

7327. (*By Lord Morton.*) I do not quite understand whether the question was actually asked, but supposing there are two vacancies and three boys come up or five or ten, how are the vacancies filled up? How is the selection made? Is it by examination?—No. It would run on these lines. Supposing the age question did not settle it, then the first applicant would get it. That is, the one that applied last would have to hold over till the next time. But as a rule if there is a lad just turned 16 who has not been on a farm at all, which fact they gather from his application form and the particulars he has filled up, he will probably be written to to say, "Your application will have to stand till next year"; but if they were on all fours then the last applicant would be put off.

7328. Do you consider that a more satisfactory way than some form of elementary entrance examination?—They have rather made those circumstances, such as position and so forth, weigh with them more than the school element in the past I think. I am not sure that an entrance examination would not be of some use but at first, of course, difficulties were anticipated in the way of

getting applicants and they did not wish to make more difficulties than necessary, and it has never been altered. It might not be so now. But it is very seldom that we have to refuse anyone.

7329. (*By Mr. Latham.*) With regard to the new pupils that Lord Barnard asked you about, you take all you can take in or that you have accommodation for, do you not?—Yes, we do now.

7330. But if there were more pupils you would refuse them simply from want of space?—Yes.

7331. I want to know a little more about your dairy school teaching. Have you them simply for the eight days' course or the ten days' course?—Ours is an eight weeks' course at Newton Rigg. The ten days' course is the course of dairying—that is, just plain butter-making in connection with our travelling dairy. It has not anything to do with the fixed school at Newton Rigg. It is separate.

7332. I quite understand that, but I want to know when they have done with that course, do they go further afterwards?—They go through no further course after they have been through the Newton Rigg course of two months.

7333. But after the dairy course of 8 or 10 days, what is your school course of dairy teaching?—I do not quite understand the question?

7334. What education do you give them on the different properties of milk?—In our dairy school they have regular lessons apart from the actual butter-making and practical work. They have regular lessons every afternoon concerning the composition of milk, and they have milk testing to do and so forth, and everything in that way, and lessons in matters that regulate the quantity and quality.

7335. Who teaches that?—The dairy teacher.

7336. The instructress?—Yes.

7337. Are they taught soft cheese-making?—Yes; that is the simple cream cheeses, double cream cheese and cream cheese which we find sells very well in the hotels.

7338. What sort of examination do they go through?—The Professor of Agriculture at Armstrong College sets a paper based upon their practical work, and upon the principles that have been taught, which has to do entirely with the nature and properties of milk, and the management of dairy cows and milk testing, and cheese-making and so forth. That is the whole of the work they have done and the principles that underlie that work. That is the paper examination. Then they have marks regularly given for their practical work, and those marks are sent up to the examiner, and he combines the marks they get for practical work with the results obtained on the questions in the examination.

7339. But they have no scientific teaching in dairy management beyond that?—No.

7340. How do you succeed in regard to the price of produce?—We just get the top market price for our butter and for our Cheddar cheeses. We sell them all almost retail. We make small cheeses of from 8 to 16 lbs. weight, and we dispose of about 300 of such cheeses in the course of a season at about 9d. per lb.

7341. That is the first time yet we have heard that you made any cheeses?—I gave that evidence in my original description—I said that we made Cheddar cheese.

7342. Then your daily school teaching means that you teach them the ordinary short course of butter-making?—No, it is a two months' course always at Newton Rigg.

7343. But the itinerant dairy is part and parcel of it?—No, it is quite separate. It goes from village to village. It merely teaches butter-making.

7344. That is not under you?—No.

7345. If they wish they can come to you?—Yes.

7346. Then it is part of you. If they do get on well with the dairy schools they come for what I call a higher class?—Yes, for a more thorough course.

7347. You do make soft cheeses and Cheddar cheeses of a small size?—Yes.

7348. And you are successful in that?—Yes.

7349. The education is eight or ten days with the itinerant schools and eight weeks in the other?—That is so.

7350. Then, if any of these girls in these dairy schools want to go further, where can they go to get scientific

knowledge?—If they want to go further they will have to go to the Midland Institute or to Reading or to Kilmarnock, or to some of those places, and pay for themselves.

7351. There is no scholarship attached?—No, we have not got that.

7352. Then you have no final examination?—Yes, at the end of the eight weeks' course. There is an examination, too, at the end of the ten days' course with the migratory dairy. There is an examination at the end of each course.

7353. What does that mean?—As to the ten days' course, I go at the end of the course with the dairy van or travelling dairy and relieve the teacher of all responsibility for the time being, and go into butter-making and upon the results of that the pupils get certificates with their marks upon them. Then at Newton Rigg at our fixed institution I have nothing to do with the examination at all. The Professor of Agriculture of Armstrong College conducts that.

7354. Are these girls who have gone further than that examination sufficiently qualified to go and take dairy work?—Yes, the majority of them.

7355. Then with regard to the boys, you make it a *sine qua non* that they should be two years on a farm?—We like it in that way.

7356. Does that mean that directly they go home from school they go on to their father's farm?—Yes.

7357. Supposing that they are not sons of farmers, how do you manage then?—Then they are at a disadvantage when they come to us. But they will pick up farming ideas better than they would in an ordinary way, from the fact that the majority of their fellow-pupils are farmers' boys, and they soon rub it into these other boys.

7358. But if they have left school at 14 and you will not take them till they are 16, then they get two years of idle life?—Yes.

7259. Does not that very much deteriorate their anxiety to go on with their education?—We do not think so. We think that two years' practical work is one of the conditions of success.

7360. But you do not quite understand my question. As to these boys that are not sons of agriculturists, and have no opportunity of being on a farm, they must do something from 14 to 16, and do you not take them until they are 16?—These lads never come to us. A lad that would come to us who has not been on a farm as a matter of fact is a lad who has gone from the elementary school to the secondary school, or has perhaps never been in an elementary school. They come from school straight to the age of 16 or 18.

7361. But the last witness said you had several pupils coming from the town who had not any knowledge of agriculture?—Yes, and those will come from the grammar schools.

7362. They would not have been on a farm at all?—No.

7363. What sort of students do they make?—I do not know what they make eventually, but they are the students who grasp the scientific teaching very well, and often do very well in their paper work, but they cannot see the bearing of it upon their actual work so plainly as the lads who have been on a farm first of all.

7364. What do you term the outsiders, because you said you had a good many outsiders?—No, not a good many—very few outside the counties of Cumberland and Westmorland.

7365. I thought you rather meant outside the agricultural element.—No, there are very few indeed.

7366. Can you give us an illustration of these men that you say go as farm bailiffs. Are they farmers' sons or are they better class agricultural labourers—they themselves, that is?—It is possible they may have been the sons of small farmers, but they have had to go out and hire themselves as agricultural labourers themselves, and then later on they come to us.

7367. You spoke of their finding such an advantage in your book-keeping?—Yes.

7368. How far does your book-keeping go?—We teach them the principles of book-keeping, that is, we teach them what the ledger means, which really is the foundation of book-keeping. Then we do not keep a very complicated set of books. There is just the diary in which the ready entries are made of money transactions and all other transactions, and then there is the cash book and the journal

Mr. W. T.
Lawrence.
11 June, 1907

Mr. W. T.
Lawrence.

11 June, 1907

to help them in posting their ledger, and then there is the ledger. That is all.

7369. I have been quite unable at present to find out what sort of experiments yours are. What are they?—Our experiments at Newton Rigg are carried on with all the crops we grow. In growing the corn crops, for instance, it may be one year half a dozen varieties of oats grown on equal areas and under equal conditions. Then those crops are weighed as they are carted home from the field and stacked, and they are weighed again when threshed so as to get at the actual weight of the corn and the approximate weight of the straw. Or it may be the same kind of oats are grown on different tracts, with the plots differently manured. Then in potatoes, the crop may be varieties, or the crop may be differently manured. With swedes, the same. There it is different manuring that is being done. For example, we are, at present, taking it in another direction. An acre of swedes is grown with artificials consisting of nitrate of soda superphosphate and kainit, and the adjoining acre to that is grown with nitrate and kainit, but with the same money value of basic slag instead of superphosphate. The swedes thus grown are to be eaten by sheep, the result is found in the mutton produced, the point being, does the basic slag or the superphosphate produce better value.

7370. Have you carried that on on the grass farm to try the value of manures there?—No, we have not been able to do that. We have to farm for the school to a large extent, and we do not want any sheep on the farm at all after the end of June if we can help it. We want all the grass for our cattle, because we have to keep a big dairy herd to keep our pupils going with milk so that we are rather too limited in the area of our grass land to be able to carry out any real feeding experiments as they do at Cockle Park Farm and other places as to manurial feeding qualities.

7371. Do you have any feeding with regard to milk production?—Yes; we have experimented a good deal in winter rations and some in the feeding of cattle, too, on the pastures. Perhaps we have carried out as many experiments as any institution existing in that direction.

7372. Have you carried out any experiments in milk testing?—Yes; we test our milk. Each cow's milk is weighed every morning and evening, and registered. Every cow's milk is tested on the first of the month, morning and evening.

7373. But not every day?—No, there is no testing every day.

7374. Do you do any analytical work?—Not strictly analytical—not more than can be done by the testing for butter fat, which is approximately correct, and, of course, the obtaining of the other solids in the milk by means of the specific gravity.

7375. Do you do anything of that kind with regard to manures?—No, we do not test manures analytically. We avoid giving the boys, when they are there, any ideas of actual testing of food or manures, we think that once a boy gets dabbling in analytical chemistry, it will rather tend to spoil him as a farmer.

7376. I was going to ask you how far you went with chemistry?—We go pretty soundly into our chemistry, so far as we do any. We expect a boy, for instance, to be able to do this—if you gave an analysis of dissolved bones, for instance, we should expect him to be able to give you the approximate money value, and we should expect him to be able to say what he understood by three per cent. or four per cent. of ammonia, and we should expect him to explain what was meant by 17 per cent. of soluble or insoluble phosphate.

7377. What lectures do you give?—There is lecturing every morning from nine to twelve.

7378. That is in the College?—Yes, in the school.

7379. Have you ever tried to lecture outside?—Yes. It falls on me to do all the local lecturing outside.

7380. Just tell the Committee what are the subjects you lecture on?—The breeding and rearing of stock, cattle and sheep, manures and manuring, feeding stuffs, the diseases of crops, the cultivation of the different crops, and lime and its uses and practically any other subject that is asked for. They deal with isolated subjects much in the same way as the Board of Agriculture's pamphlets deal in the written form.

7381. How far do you carry poultry management?—We keep 150 head of poultry and we do not go in for pure breeds, but we cross carefully. We cross with pure male birds with a view to keep up the difference between table

and laying qualities. The girls kill the poultry and dress them and truss them ready for market.

7382. Do they manage them?—They partly manage them and they have the dairy teaching too.

7383. Who is the poultry teacher?—The dairy teacher.

7384. Then really you have got your dairy teacher and yourself as the staff of the College?—That is the staff.

7385. You keep a matron, I suppose?—My wife is the matron.

7386. (By Dr. Somerville.) I had not the benefit of hearing your evidence in chief, so that if I ask you any question with regard to an issue you have already given information on, I hope you will pull me up. I want to ask you first of all whether some of these grassland experiments that you and I put down in the very early years of the nineties, are still being carried on under the original scheme—They are all being carried on—that is, all that were finally selected.

7387. That is the eight?—That is the eight. They are all carried on at the present time. But it has now been decided by the Agricultural Committee that they should give up those on what we call roughly the hard land, and simply keep to those on the peaty soil. There are a couple of newly reclaimed pieces of peaty soil that have been taken in hand.

7388. Do you know any place in England where the local experiments have been so persistent as in Cumberland?—Not unless the Northumberland and Durham ones have.

7389. Say the North of England then?—No.

7390. You believe then in continuing the same work upon the same areas year after year?—Yes, if you want to get certain results and get information.

7391. You have, in fact, been carrying on some of these local stations for, I suppose, very nearly fifteen years?—Yes, for fourteen years.

7392. In fact, except at Rothamsted, there are no areas of grassland which have got the same length of experimental history as in the North of England?—No.

7393. Do the farmers still maintain their interest in these local experiments?—The outside farmers do, but those on whose land the experiments actually occur are rather offering difficulties now.

7394. But I am not thinking about them so much as the others—the man on whose land the experiment is being carried on may be pretty well trusted to know what the results are, but do the others and the younger farmers take an interest in the results that you get?—I think so.

7395. Do you know that the Board of Agriculture have published schemes for field experiments?—Yes.

7396. Have you put any of these schemes into practice in Cumberland?—No, the only place in which we could have done it without enlarging our field of experiments, would have been at Newton Rigg, and we have not done it there because our stock feeding experiments have rather been in the way.

7397. But still you have got local experiments, I suppose, besides those on pasture land and those at Newton Rigg?—Not at present.

7398. So that you have not had the opportunity of putting forward schemes in that way?—No.

7399. Do you utilise the Board of Agriculture's leaflets in connection with local lectures?—Yes, a good deal.

7400. And also in connection with your courses in the school?—Yes.

7401. Do you, in point of fact, make it a practice to see that your pupils in the school are supplied with a set of the Board's leaflets containing information bearing upon your instruction?—Certain sets.

7402. I suppose you are appealed to by a considerable number of farmers with regard to their difficulties?—Very largely. I am glad to say, and sorry to say in one way. That forms a goodish bit of work at present.

7403. Then you think Cumberland farmers, hard headed men, and able farmers as they are, consider that they can get information of value to them by making application to their local agricultural school?—Yes, that is a marked feature of the present day. The old prejudice which existed and which was very strong, as you may remember, in early days seems to be practically broken down. My correspondence amounts on an average to something like twelve or fourteen letters a day, and the majority of them are concerned with questions asked by local farmers.

7404. Do you notice that this work is growing?—It is growing.

7405. I suppose, when you started at first, you did not get twelve or fourteen letters in a week?—No.

7406. Do you ever meet with any opposition now?—I do occasionally meet with old men who oppose, but it is broken down. We have strong evidence of that in the fact that we have got twenty cases where we have had two, three, or four, and in one case five children coming from some families, and it is almost certain that if we have one pupil from a family, and others of the family intend following farming, that these also become pupils, so that the instruction is being appreciated by the farmers themselves at any rate.

7407. You do not find any complaint that the pupils who have been through your school work less when they go home than they did before coming to you?—No, not at all. I do not think we keep them long enough for that.

7408. You have already stated you have very few pupils from Alston?—Yes.

7409. I suppose you would agree with me if I suggest that Alston is drained by the Tyne?—Yes.

7410. And that the natural route for an Alston boy to take who aspires to higher education is towards the east coast and not towards the west coast?—Yes, that is so, naturally.

7411. (*By Professor Middleton.*) You have been a teacher, I think, or have been connected with teaching all your life?—Yes.

7412. You have had a long experience?—Yes.

7413. Is your object in developing this Farm School in Cumberland, or the object of the county, to provide there the type of education which would be a practical education for the farmers of Cumberland?—Yes, that is so.

7414. As the result of your experience you have told us that you find the boys are suitably prepared for you when they have passed the seventh standard in an elementary school, and have had two years' experience on a farm—there or thereabouts?—Yes.

7415. Would you, as a matter of fact, prefer to have a pupil who has had that training which I have just indicated, or one who had gone from an elementary to a secondary school and had no training on a farm?—I should prefer the one from the elementary school who had had some training on a farm.

7416. You are absolutely convinced of the necessity of farm training to enable them to benefit by the type of education given, are you?—Yes, for the purpose of our education.

7417. Your general object when you get the boys is not to prepare them to go further, but to prepare them for farming?—Yes; of course there is nothing in the school course to discourage them in going further.

7418. No, but your object is to finish their education?—Yes, to make them successful, intelligent working farmers.

7419. A great deal has been said about the numbers you have—10, I think, is your number?—Yes: all boys.

7420. To begin with I dare say you found some little difficulty in getting the 10?—We did. We have never had much difficulty with the boys, but in the summer course with the girls we have had. We do not find any difficulty now.

7421. If your premises were enlarged, and you had a greater number of bedrooms now, do you think you could fill the bedrooms? Could you get 15 or 20 from Cumberland and Westmorland?—Possibly.

7422. You are not certain of it?—No.

7423. You would not be prepared to recommend it?—No, but we could easily get them if we take applicants from outside, because we are continually having applicants from outside the county.

7424. So that the type of school which you have in Cumberland, we may take it, has been found to be enough for the requirements of the county?—Yes, it seems to me so.

7425. Dr. Somerville referred to the experiments in which you have been interested in Cumberland; in your lectures to farmers, do you find much benefit from the results of

those experiments?—Yes, that is a very important point.

7426. It is in that way that you get their interest?—Yes, a great deal of it.

7427. You refer to your local experiments?—Yes, to our local experiments that we carry out all together.

7428. (*By Lord Barnard.*) Since I asked you about the population I have referred to the Census tables for 1901, and I find the total number of people engaged in agriculture in Cumberland was 16,700, and in Westmorland 6,600. It is not quite in the proportion of 3 to 1?—No.

7429. But on the other hand I also find that there are a larger number of people employed in agriculture in Cumberland than in any other occupation?—Yes, that is so.

7430. There are 15,000 males alone, and a certain number of females?—Yes.

7431. So that practically agriculture is the principal industry of the county?—Yes.

7432. It is more than double any other?—Yes.

7433. (*By Professor Middleton.*) We were told that the cost of the Newton Rigg School was £658. I am not quite sure whether that is the cost to the County of Cumberland or the entire cost, including Westmorland?—That is the annual cost to the two counties. It is the total annual cost. If you want to know how that is divided up, the loss on farming has been £100 in the year, taking one year with another, and the rest of the money is really the education salaries and the working of the schools and extras.

7434. (*By Dr. Somerville.*) There is rent or interest?—Our interest is equal to a rent of rather over £2 an acre; and, more than that, the place is always open to visitors. It is a big house, and they are big premises, and there is a good deal of ornamental garden work that would never be done on a farm, and that means an extra hand employed to keep the place as it is. Then there is the other point that we are limited in our farming conditions. We are two miles from the Penrith Railway Station, and if we engaged in the milk trade there is no easier place to engage in it than at Newton Rigg, but instead of that we just rear stock and make butter and cheese as could be done 20 miles from the railway station. It is more especially to keep cows that we do the farming, but we also keep sheep. In every way we are limited. At this time of the year, and the earlier part of the year, we are killing hens that are in full laying for the purpose of demonstrating in poultry work. That is not profitable, but it is still one of the necessities of the farm.

7435. (*By Mr. Latham.*) Do you do anything in horticulture?—No, not much. Practically I may say nothing excepting in fruit growing.

7436. What do you do in fruit growing?—We have a fruit demonstration plot, as we call it, of three quarters of an acre, and that is laid down in small fruit, and apples, pears, and plums in large variety and hardy kinds. It is in a very exposed situation. They are all plainly labelled. The fruit is attended to by the horticultural lecturer, and the idea is to show the varieties of fruit that do best in the northern counties and exposed situations, and there is grafting and pruning, grease banding and manuring and so forth. We issue bills to the villages round, and people come and see the work being done.

7437. Do you carry it on outside the school?—No.

7438. Not at all?—Yes, the horticulture is under the horticultural lecturer, who is engaged the whole of the year through visiting gardens and giving lectures.

7439. Is he one of your staff?—No, he belongs really to the Armstrong College. His work lies entirely in Cumberland and Westmorland.

7440. Do you get a grant from the Board of Education?—£70. But there is a question whether it will ever be obtained again. From the Board of Agriculture we get £100.

7441. But from the Board of Education?—I do not know whether it has yet been received, but we are told there will be a grant for this past year, and it may be £70 or £71.

Mr. W. T.
Lawrence.

11 June, 1907

Mr. JOHN SMITH-HILL, B.A., B.Sc., called and examined.

Mr. J.
Smith-Hill.
11 June, 1907

7442. (*By the Chairman.*) You are the Principal of the Aspatria College, Carlisle?—Yes.

7443. You have been Principal of the College for the past 13½ years, since 1894, that is?—Yes.

7444. Before that you were Agricultural Science Master to the Woodbridge School in Suffolk?—Yes.

7445. Will you give the Committee some idea of the number of pupils you have?—I have made out the numbers during the last five years, and in that time the total during the session in residence have been 34, 38, 34, 29, and 28—the 28 being the number for the present session, from October, 1906 till July, 1907.

7446. Your pupils mostly come from the public schools, do they?—At the present time they do.

7447. Such as Rugby, Shrewsbury, Charterhouse, Uppingham, &c.?—At the present time we have students from those schools and others.

7448. They are the sons of professional men as a rule, are they?—Yes.

7449. A few are the sons of large farmers?—Yes, we have always had some sons of large farmers in England and also from Scotland. The greater number have, however, generally been the sons of Scottish farmers, who seem rather to appreciate agricultural education more than the English tenant farmers do. I have had more farmers' sons straight from Scotland than England during the 13 years I have been there.

7450. And also students from India, Natal, the West Indies, and the Argentine, and India?—Yes.

7451. So that you have pupils from a great variety of places?—Yes.

7452. You have no grant from the County Council, have you?—None whatever.

7453. And no grant from the Board of Education?—No.

7454. You entirely depend on your own means?—Yes.

7455. The College is leased by the Principal from the trustee of the late Dr. Webb, is it not?—Yes, Dr. Webb was the Principal of the College until 1893. He gave evidence before the Commission on Agricultural and Dairy Schools in 1887.

7456. Therefore you rely entirely for the support of the institution on the fees from your students?—Yes.

7457. Now as to the age of entry of the students?—The students enter when they have had a good general education, because afterwards they specialise in agricultural subjects. They have practical and scientific instruction, and their age is, therefore, from 17 upwards.

7458. There is no entrance examination, is there?—No; there is no entrance examination.

7459. You prefer, I suppose, that they should have had a general education?—Yes, that is my opinion.

7460. You do not want them to be specially trained in what we might call secondary agricultural education?—I have had a little experience in that way. As I have already said, I was agricultural science master at Woodbridge School, where the Charity Commissioners formulated a scheme, under which I was the first agricultural science master. There was an Agriculture Department in that school.

7461. And an Agriculture staff?—An Agriculture staff, the school being in a specially purely agricultural district. I commenced the organisation of the scientific work there, and had the arrangement of the chemical laboratory and class rooms in reference to the science teaching. They were being built when I was there, but I left owing to my being requested to go to Aspatria as Principal. As to what under this Charity Commissioners' scheme the school is doing as an agricultural school now I do not know, but my opinion is, speaking from my experience, that at the age of 17 it is better to have had a good general education, and on that sub-structure to lay the special agricultural work, which can then be proceeded with alone.

7462. You are not in favour of an agricultural side being added to a grammar school, say?—No, not a purely agricultural side, but the scientific side will be developed as regards Chemistry and Biology, and the instruction will be of assistance to anyone after joining an agricultural college.

7463. A modern side?—Yes.

7464. Your pupils can go to the modern side of a secondary school?—Yes.

7465. Now as to the fees what do you say?—The fees per annum are from £94 10s. to £103 19s. per annum—30 guineas and 33 guineas a term.

7466. Thirty guineas when under 20?—Yes.

7467. Thirty-three guineas when over 20?—Yes.

7468. Then all your pupils are resident, are they?—They are all resident, but we may occasionally have one or two older men residing in the town who take the classes as out-students, but they are practically all resident.

7469. How many have you?—In the present session we have 28 residents.

7470. Then as to the destination of the students, what do you say?—For the purpose of this enquiry, I have gone over the college books, and I have looked to see where the students have gone since 1900, and I find that of 158 who have passed through the college during that time for varying periods, there are now 61 farming in the United Kingdom: 46 farming in the Colonies and abroad, such as in the Argentine; and 25 who are land agents and surveyors; and I find that nine have gone into business and have forsaken agriculture; and there are 17 whose occupations at the present time I have been unable to follow. I do not know, but it may be that some still have followed agriculture.

7471. Then as to your staff, what do you say?—The staff consists of five resident qualified lecturers having different departments. There is a lecturer in Agriculture and in Rural Economy, and there is a lecturer in Agricultural Chemistry, devoting himself to that work only, and another in surveying and Estate Book-keeping, who takes that work only, and another in Veterinary Science, who is really the veterinary surgeon of the district, who lives opposite the College. He takes the students to cases in the course of his practice, and gives lectures in the College. The last department is my own, Biology and Forestry.

7472. You think that staff is adequate, do you?—It is adequate for the number which the college will accommodate, which I consider to be from 35 to 40 resident students.

7473. Now with regard to the course of instruction, the complete course is one of two years?—Yes.

7474. At the end of it, they either obtain a diploma or a certificate?—Yes.

7475. What is the difference between the diploma and the certificate?—The diploma is obtained through an examination both in the first year and at the conclusion of the second year, and students have to reach a sufficient standard before the diploma is granted to them in the subjects which they have taken throughout their course.

7476. Then as to the certificate?—As regards the certificate, the certificate is, as it were, a second class diploma, that is, one which is obtained by those doing more practical farm work rather than so much college work—that is, who are going to the Colonies or to the Argentine, who spend a good deal of time in learning practical farming. These have their certificates in both their college working and their ordinary work awarded without having to reach a stated standard in examination, though they take the examination of the College at the end of their course.

7477. Do any of the students afterwards go to the University of Cambridge, say, or to Newcastle, and so on?—We have had one or two go to Cambridge in the course of my principalship, but not elsewhere. We have had students who are graduates of Cambridge who come to learn agriculture with us in order to take up land agency work; but not the other way.

7478. It is more the reverse?—Yes.

7479. The university graduate comes to you rather than that you send to the universities?—Quite so. But there are few of them in each case.

7480. A large number of your students only take the year's course?—Yes. A large number either go abroad after they have taken the year's work or go to practical farming and do not get the full benefit of the course which they should have.

Mr. J.
Smith-Hill.
11 June, 1907

7481. But you find they have sufficient appreciation?—Yes.

7482. Then the intermediate land agents' examination of the Surveyors' Institute is one of the examinations?—That is one of the examinations.

7483. That is passed by 18 out of 21 presented, I see?—Yes.

7484. That is a considerable number?—Yes, and we always hope to get everyone through. Eighteen have passed and three have missed.

7485. Then one examination is the National Diploma Examination?—Yes.

7486. Could you give to the Committee your opinion of that examination?—I think the National Diploma Examination is an excellent examination, and one which really requires a longer time to obtain the diploma in than is the general case in agricultural colleges. It is largely a course which requires three years for the first part and another year at least for the second part. I think that it is an examination which is much more appreciated by those who are becoming agricultural teachers and lecturers than by practical farmers or by those who intend to be land agents. Those who intend to be land agents appreciate the examination of the Surveyors' Institute as being more practical, and not requiring such a high standard perhaps of scientific attainment as in the National Diploma in Agriculture. I think that the subjects of the National Diploma Examination have not sufficient elasticity and that more alternative subjects should be possible to be taken in the first or second part instead of certain subjects being obligatory in the first part and certain subjects in the second part. I know that, for the last few years, representations have been made by which that has been met to a slight extent. I am a member of the Agricultural Education Committee and from time to time we have had a great many discussions as to the nature of the National Diploma, and we have made representations through that body to the Royal Agricultural Society.

7487. (*By Lord Moreton.*) Do you mean the Society of Agricultural Teachers?—Yes.

7488. That is rather a different thing?—It is called the Agricultural Education Association.

7489. (*By the Chairman.*) Then the amount of preparation which is required for the National Diploma is about the same as the amount of preparation that is required for the Agricultural Degree of the University of London?—Yes, I should say so.

7490. Of course you would encourage them to take the Degree of the University of London?—Yes, rather than the other.

7491. Now with regard to the method of instruction, what do you say?—Our method of instruction is by means of lectures in the morning and evening in the winter time. Of those lectures the students have to take rough notes during the lecture, and they have to be re-written in a certain time allotted for the purpose and handed in to the various lecturers at the end of the week, so that it can be seen that they have done good work in the course of the lecture. The practical work is divided into practical class work, and practical farm work. The practical classes consist of farm classes for each student once every week in which the lecturer in Agriculture takes the students to the farms around and teaches them or draws from them what they have learned by means of their practical work on the farm. It is done regularly every week for each student throughout his course, and there is also, of course, practical surveying, which is done on the land, and practical chemistry in the laboratories, and practical forestry by means of excursions through the woods adjoining, in order to learn as much as possible from the woods and plantations that are within a radius of five miles of Aspatia. In addition to that the practical farm work is engaged in by the students according to a certain time table. Each student of the college has a special individual time table in order that the principal may know where he is or where he ought to be throughout every hour of the day, and he may have some practical farm work in the morning. If he is a student going to the Colonies, he will have a lecture bearing on practical agriculture the first thing in the morning and then he may go to the farm to which he is assigned, to engage in whatever work is going on there, and then he may return to the college for another lecture in the evening.

7492. Then you have ten farms in the neighbourhood of the college taking about 2,000 acres, two-thirds arable and one-third pasture, which are valuable for your students?—Yes. The arrangements are made with the farmers

to allow access to these farms at any time on the part of the students and the lecturers for the purpose of instruction and for the practical students to learn practical work. A payment is made to these farmers annually for that purpose.

7493. At one of the farms demonstrations are carried on in manures?—Yes. For the purpose of demonstrating our object in experimenting is not at all that of experimental study but simply demonstration, to enable the students when they are farming afterwards, to carry out experiments in order to find what proportions of the artificials with or without farmyard manure they should use that was best for their land.

7494. Then the lecturers take your students to the weekly stock and produce auctions which are held?—Yes; we have one close to the college on Thursdays.

7495. Do they find that a very valuable object lesson?—Yes, they are able to find the prices of stock all the year round and they get some practice in estimating their value and weight.

7496. Then you have a dairy?—We have a factory or creamery at the railway station at which instruction is given in butter-making and cheese-making. Cumberland is not a district for cheese-making, but a certain amount of cheese-making goes on, perhaps mostly for the purpose of giving our students instruction in cheese-making.

7497. Then also I suppose your students are allowed to see the book-keeping that is carried on at the creamery?—No, they do not see any system of book-keeping there.

7498. That is not yours, is it?—No, it is a private creamery belonging to a company—it is Carrick's Cumberland Dairy.

7499. Is it carried on according to proper hygienic and scientific principles?—Yes.

7500. Under a competent manager?—Yes, under a competent manager there. The creamery is very valuable for us, being in the neighbourhood, so that we may make arrangements for the purpose of instruction in butter-making.

7501. Do you say creameries might be increased in the county of Cumberland?—Judging from what the object of the production of the milk is that goes on in Cumberland, I do not know whether I should be able to answer that in the affirmative, because the farmers of Cumberland are engaged in supplying dairy cows to Edinburgh mostly, those cows being kept during their lactation period in the town dairies in Edinburgh. The farmers, of course, could, I think, supply milk to creameries in the district which might collect the milk and pass it on to places like Edinburgh and have a different system. Under the present system, as long as town dairies are allowed in Edinburgh the Cumberland farmers rise to their opportunities, and they breed stock which are appreciated because of their deep milking qualities in Edinburgh, and they would, no doubt, under an alteration of the system, rise to the occasion as well.

7502. But meanwhile they keep them in Edinburgh?—Meanwhile they send them to Edinburgh. There is a farmer and dealer in our own district who takes 50 to 60 dairy cows every week to Edinburgh, to the town dairies there.

7503. And a certain number are received back?—Yes. They come into the district again and may return to Edinburgh, but the majority of them are sold at rather a considerable depreciation to the butchers, "half-fat," and the Cumberland farmers say that if the dairymen, when the cows are going off milk, would put them to a bull of a good dairy strain, they would be then received as to any number of them by the Cumberland farmers at a much higher price than the dairymen can get for them from the butcher "half fat."

7504. Then do I understand that the farmers remain owners of the cows while they are at Edinburgh, or do they sell them to the dairy?—No, the farmer sells them to the dealer. He takes them to Edinburgh and sells them there to the dairymen.

7505. Then as to forestry, you have already mentioned in your proof that you visit the plantations of Sir Wilfrid Lawson?—Yes.

7506. In the College grounds you have placed an arboretum?—Yes, for the purpose of teaching identification of trees, the object being for such students to learn to know the various forest and ornamental trees that are met with on a landed estate in the country.

7507. Then you also make use of an agricultural co-operative society?—Yes, that is a co-operative society

Mr. J.
Smith-Hill.
11 June, 1907

which is an association of farmers in the neighbourhood for the purpose of obtaining artificial manures and feeding stuffs and seeds amongst themselves. It is a co-operative society.

7508. And it is successful?—It is successful.

7509. Is it managed by farmers?—It is managed by a committee of farmers.

7510. And the farmers are shareholders?—Yes.

7511. Then you have instruction in carpentry?—Yes, and in smith's work and harness mending at workshops in the neighbourhood of the College.

7512. And for internal work there are two lecture rooms, a drawing hall, chemical laboratory, biological laboratory, and natural history museum?—Yes.

7513. So that your equipment is quite satisfactory?—Yes, we consider so.

7514. Your College is also a climatological station of the second order?—Yes, for the neighbourhood, that is.

7515. And you find that very useful?—Yes.

7516. And good for the training of the students?—Yes. We obtain the records of the weather for that portion of Cumberland and we return them to the Weather Office. I think it is perhaps more for the benefit of the general public rather than for the benefit of our students that that work is done.

7517. As you have already mentioned, you are not, except of course in regard to the farms that you use, in touch with the farming community?—We are in touch with the farmers in Aspatria, those in our own district, and the work of the College has influenced to some extent their practice, but not in a general way in the county.

7518. But your object is essentially to train those who go to you?—Yes.

7519. You devote yourself entirely to that?—Yes.

7520. (*By Lord Barnard.*) Yours is entirely a private institution?—Yes.

7521. It not only receives no public money of any sort or kind, but it is not under any public control or authority, is it?—No, it is not under any, whatever.

7522. You are not associated with any public authority in any way?—No.

7523. Would it be a good thing if you were, do you think, or have you ever had any idea on that point?—We have had in the College up till recent years one class in agriculture held under the Board of Education of an evening under the Science and Art Department. But those ceased to be recognised by the Board of Education last year. They were attended by a fair number of outside students, the sons of farmers in the district, in addition to our own students, but of recent years the number of outside students has dropped off.

7524. Do you think that in any organised system of providing higher and better agricultural instruction and information your institution could be made use of?—I have been told so, and perhaps I might say here that just before coming in I met Mr. Medd and he said he was sorry he was unable to stay to hear my evidence, but he asked me the same question, and he said that he thought that Aspatria could come under the Board of Education, not the Board of Agriculture, under Clauses 35 to 43 of the Technical Institutions if a scheme were submitted.

7525. I did not mean so much what was possible, but I meant whether in your opinion, as having been here for 13 years and more, and in your general experience, you thought such a thing was expedient, and whether it would be of practical and public utility as well as not detrimental to the school. But perhaps you have not gone into that?—It is not a question I have given a great deal of thought to, because we have been altogether independent of public authority. We have had to obtain our students by the quality of our work simply, and I have not entered into the question, thinking that private institutions have no means of being organised under authority, I have not really considered the question.

7526. You know what the reference to this Committee is, I daresay?—Yes, I have the reference.

7527. It is to enquire into the provisions for affording technical instruction, and then to report whether in view of the practical results obtained the existing facilities are satisfactory and sufficient, and if not, in what manner they may be with advantage modified or extended?—Yes.

7528. I thought perhaps the future of your college came within the scope of that. I do not know whether you wish the Committee to take any view of yours on that subject?

—Seeing what has happened with most proprietary institutions, many of which were established before the County Council colleges, it would probably be better for the continued existence of the College if it were united with some scheme of that kind.

7529. I do not know what accommodation you have for students?—Thirty-eight.

7530. Are you ever full?—Yes, we have been full from time to time.

7531. Does the number of students show a tendency to fall off?—Yes, I think the number has of recent years.

7532. I will ask you not to answer the next question if you think it will be in any way detrimental to the institution. Please just say so if you think so. Do you think that in the altered circumstances of the present day there is any probability of the College being continued on its present footing. Pray do not answer that if you think it would be detrimental to your College?—I think I would reply to it, because it is a question that I have faced. I think that possibly in the event of my discontinuing the lease of the College as Principal it would not continue as an agricultural college.

7533. Then, assuming that your interest ceased when you left, do you think it would be a pity from a public point of view that the institution should collapse?—Yes, I think it would be.

7534. You think it would be desirable that some steps should be taken to put it on a more permanent and safer footing?—Yes, I think it is highly desirable, because as regards the natural facilities for giving agricultural education, its situation in Cumberland is very favourable, and I believe it is largely owing to that that the College is in existence at the present day.

7535. And it is well equipped?—Yes.

7536. It is equipped with laboratories and so on?—Yes.

7537. And the result, so far as you have already given us the numbers actually, are that since 1900 60 men to your certain knowledge are engaged in practical farming at home and 46 abroad?—Yes.

7538. Then another sixth are engaged in the allied industry of land agents?—Yes.

7539. So that for many reasons it would not be desirable to allow it to collapse if means could be found to carry it on?—Yes, I am strongly of that opinion.

7540. Speaking of your own career as a teacher of these special subjects, were you associated with agriculture in your early youth before going to school at all?—No, I was not. I graduated at London University, I took the degree in arts and the degree in science, with honours in botany. My bias lay towards what I may call natural science subjects, and on the suggestion of my predecessor, Dr. Webb, whom I knew then, he advised me to get further training in agricultural science work, and for that purpose, by means of classes and spending my vacations at farms, I qualified myself for the examinations of the Royal Agricultural Society. I also went to Germany and France to study the organisation of agricultural schools and colleges. I took second place in the senior Royal examination of those days, and by virtue of that I obtained the post of agricultural science master at Woodbridge School in 1892.

7541. Are your staff much in the same position as yourself?—Yes, they are all qualified men, either having obtained the National Diploma in Agriculture or the science degree in agriculture of one of the universities.

7542. Are they men who have been brought up on farms?—All of them have spent their lives on farms. The principal is the only one who was not brought up on a farm though he lived in the country.

7543. (*By Lord Moreton.*) Will you tell me if your examination at the end of the course for the College diploma is conducted by an outside examiner?—It is conducted by the lecturers themselves.

7544. There is no outsider?—No, we have no outside examiners.

7545. What year was it when your candidate was successful in the National Diploma Examination?—In 1902.

7546. Have you got anything like a committee or board of visitors?—No, nothing of that kind.

7547. I suppose, as far as regards forestry, that is a new departure rather with you, as in most places?—I have had a class in forestry all the 13 years I have been at Aspatria. Sir Wilfrid Lawson has helped us in the past a good deal; in fact, a year or two ago he put eight acres at our

disposal in order to enable us to carry on demonstrations which would illustrate sylvicultural principles.

7548. For all these years have you had a forestry nursery, shall I call it?—Yes, we had an arboretum, but I have not had it all these years. That was started in 1902. It is only five years old.

7549. I think you told Lord Barnard just now that you had passed the Senior Examination of the Royal Agricultural Society?—Yes.

7550. Do you consider, looking back at it, that that was more practical than the Diploma Examination?—The old Senior examination of the Royal Agricultural Society a more practical examination than the present one, do you mean?

7551. I will withdraw the word practical, and say a better examination?—I think that the change into two parts was a step in the right direction. The students are not obliged to take the whole examination as I did at one sitting. I think the examination being made into part one and part two in different years is certainly a step which has been for the benefit of the examination, and not only the examination, but the pupil—I mean the benefit of the pupil taking the examination, I should have said.

7552. (*By Mr. Latham.*) Do any of the County Councils allot scholarships to your college?—The Cumberland County Council have a scholarship, or rather their scholarships are tenable at Aspatria College if the student desires it, but as you will know, they have an agricultural scheme of their own in connection with the Farm School at Penrith; consequently the scholarship has not been held at Aspatria except by one student I think at the time that I went to Aspatria. We have not had any scholarships from the County Council since then.

7553. In the early days of the County Councils I think other counties gave scholarships to Aspatria, did they not?—At the time that I went to Aspatria there were scholarships from a great many counties at Aspatria, from Lancashire, from Warwickshire and from Berkshire and others. That was on account, I believe, of the result of the previous Commission, because Aspatria was pointed out as being a school then more for tenant farmers, and one of the few in existence at that time; but owing to the growth of the County Council institutions, the constitution, I may say, of Aspatria has become altered.

7554. That would account to some extent for the students falling off, would it not?—Yes, that would account for it. The numbers were greater in these days.

7555. What is your first and second course?—Our first year's course is a more general course. For instance, in chemistry and botany, the general principles of the sciences are taught to the students in the way, for instance, that they would be questioned at the National Diploma Examination on those subjects. In the second year they will more particularly confine themselves to the special agricultural portions of those sciences.

7556. But would the first year students be eligible for the National Diploma?—They would be eligible to take it, but they would not have done sufficient work to take the National Diploma in one year's time.

7557. I presume there it is a great difference in regard to the fees as between one and two years?—The fees are the same per annum. The second year's fees will be the same as the first year's fees.

7558. What I rather meant was, did it open the college to a poorer man, I will say, if he only went to the first year's course. I know, because I belong to Berkshire and was instrumental in sending two or three students to you in the early part of the time, and I know they used to recommend the two years' course?—Yes.

7559. What I want to know is this. Some men cannot afford to go for two years, and I presume if they only went the first year it would be considerably less money, and considerably less education?—It would be just half what it would be for the two years.

7560. You spoke of the examinations being almost entirely inside. Do you discourage outside examinations?—No; I gave a wrong impression if I said that. The question asked me was, "Were the examiners outside examiners or was the examination of the college conducted by the lecturers of the college themselves?" I understood that was the question.

7561. But I will go a little further. We have had witnesses very much in the same position as you, who spoke against, I may say, outside examiners, and I did not know whether there was any feeling in Aspatria with regard to that and whether the examination should be conducted

by your body or by outside examiners?—I should not like the examination to be conducted absolutely by outside examiners, but personally I have no objection to examinations conducted by outside examiners associated along with the actual teachers.

7562. Do you carry out a system of entirely practical work, or is it all associated partially practical and partially scientific?—It is partly practical and partly scientific. That is to say there are no students who might perhaps be called farming students, who simply go to work with farmers and take no college work at all, if that is your meaning.

7563. Generally I suppose you expect them to have some considerable practical knowledge before they come to the college?—No; we have a large number of students who have no knowledge whatever of agriculture and who have to learn the practical part of it in the course of their residence there. The majority of them are in that position because at the present time, speaking of course of the present time, as I said earlier, we have very few sons of farmers, and where we have sons of farmers of course they will have had some knowledge of practical farming, or we may have occasionally students who have passed some time (we have at the present time one or two of those) on farms as farm pupils for a year or two years, and then they come to the college for scientific training.

7564. Which do you prefer, may I ask, provided that they are going to be farmers afterwards?—If there was an organised system of training I think that some knowledge of the practical work before entering college is better. The student will gain more than if he comes green to the college.

7565. Your idea is that the man that comes with no practical knowledge of farming would be better to have the scientific training at the latter end of his education than going to the farm after he has had a scientific education?—Not quite so much in that way perhaps. When I say that it would be better to have some knowledge of practical work, I mean he appreciates the lectures in college if he has some knowledge of practical agriculture. He appreciates them better and sees their meaning and tendency better than if he has come without any practical knowledge of agriculture and came directly from a town. The proportion of practical work would be better obtained (speaking more of ideal cases really) by having a student a year or so at it. I am referring to the boys and young men from the towns who would benefit more by a college course after having been a year on a farm and then going to the college than if they went to the college directly from their school. The practical objection to such a course is that if they have been long on the farm first they will be disinclined to return to the routine of educational training.

7566. Whether they were town men or countrymen?—No, my remarks only refer to town men.

7567. (*By Professor Middleton.*) Can you give us some idea of what proportion of your students come from country and from towns now, because you say a large number come from public schools?—Yes, of course, a number of them come from the country, but they are not farmers' sons, although they have a general knowledge of country life. They have not anything like the practical knowledge of a farmer's son.

7568. The numbers entering your Institution at present would be something like 15 a year, would it?—More than that. To give you the number for this last year, 15 entered in October, one entered in January, and five entered in May.

7569. Then they do not all stay for the two years, do they?—No, they do not.

7570. You have 20 entering this year and 28 students, so that there must be eight of the second year's students?—Yes, of course. That would be the number of second year's students that we have.

7571. Of course, those who think of going in for an examination must all of them have stayed two years at least?—Yes.

7572. Do many of them stay for three years?—Occasionally. I have one at present who has stayed three years, in order to go in for the Cambridge agricultural diploma, and he was examined last week.

7573. Have you had many going in for the National Diploma of recent years?—No, not in recent years—not since the constitution of the college has become altered.

7574. That is to say, you are getting now a different type from what you had in the past?—Yes.

Mr. J.
Smith-Hill.
11 June, 1907

Mr. J.
Smith-Hill.
11 June, 1907

7575. How do you manage the practical education of those lads that come to you with no knowledge of farming in their first year?—They are assigned to a particular farm. They go to one farm at certain times allotted in their time table, and they take part in any of the work that goes on. There is a general oversight. The lecturer in agriculture visits the farm from time to time while they are working there, and sees if they are at work, and every inducement, stopping short of absolute compulsion (which is not applied) is given to students to work practically by means of a weekly report in which marks are given for practical work to each student, and by means of a terminal report in which the position they have taken in that respect is recorded and sent to the parents and guardians, and by means of farm medals that are awarded at the end of the year to the best farm student. These are generally keenly competed for.

7576. You have ten farms altogether?—Yes.

7577. So that you have about three for each farm?—Yes, three or four—never more than four on any particular farm. It may be two or three or four.

7578. Is the farmer under any obligation, or is it a friendly act on his part that he looks after them?—He is not under any obligation other than the obligation arising from the fact that he is paid in order to do so.

7579. You do pay them?—Yes, the farmer is paid a sum per annum to allow the students to work on the farm. Sometimes, of course, the farmer benefits considerably by their work, for instance, at hay time.

7580. As a rule do you allow the same students to go to the same farms?—Regularly to the same farm. It is always best to keep to one particular farm for some time, in order to get acquainted with that farm; but, at the same time, in his practical farm class, which he also has every week, he goes round all the farms in the neighbourhood, so that he gets really to learn something about them all.

7581. The practical farming class is taken by a practical agriculturist, is it?—Yes.

7582. Does he take all the students together?—A certain number on a certain day. Each one has a regular day in his time table and he keeps to that day throughout the term in his class.

7583. How many hours are given to agriculture in the first year, about?—In the winter session from October to April there are two lectures in agriculture in the day and two in the evening—that is, four a week; and in the summer there are two in agriculture in the week for each student, or 110 in the course of the year.

7584. (By Lord Barnard.) When you talk about the students working, what is the nature of the work they do on the farm? You mentioned haymaking?—They take part in anything that is going on; they take part in the milking, for instance; they do the harrowing, threshing, and, to some extent, the keen ones get to take up ploughing. Any of the farm work, the feeding of the cattle in the winter time or the feeding of the stock in the byres, they do.

SIXTEENTH DAY.

Wednesday, 12th June, 1907.

PRESENT :

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

Lord MORETON.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor W. SOMERVILLE, D.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. BRUCE SWANWICK, called and examined.

Mr. B.
Swanwick.
12 June, 1907

7585. (By the *Chairman*.) You are a member of the Agricultural Committee of Gloucestershire?—Yes.

7586. Will you give the Committee some information as to the instruction of adults in agriculture in your county?—At present it is confined to lectures given by itinerant lecturers in agriculture, in some cases in veterinary science, by horticultural instruction, by village courses of lectures on gardening, and also through the medium of experimental plots, and of course of late there has been a development in the way of nature study exhibits and educational tents at the Gloucestershire Show. The agricultural lectures to adults have not been developed very much. They are single or short courses of lectures to adults, and there has not been any very great demand for them, and I do not think they seem to produce as much result as one could wish.

7587. They are not well attended?—Not as far as I know. We had some at Cirencester, and I do not think they were particularly well attended. I think the adult farmer wants the information brought to his door in a visual concrete form, and I think much more can be done by experimental plots which can actually be seen by individual farmers than by printed reports of experiments in other places, or by lectures.

7588. You attach great importance to experimental plots?—Yes, not from the point of view of research so much as of demonstrating broad principles with regard to manuring and so on.

7589. They should be continued over a number of years?—I think it is essential that they should be continued for a considerable number of years, in order to eliminate the difference of seasons and accidental variations.

7590. Are the experiments on the experimental plots carried out by the lecturers?—They are carried out entirely by our director, who is also lecturer in agriculture.

7591. You have a permanent lecturer in agriculture?—Yes.

7592. Is a scheme drawn up for the lecturers by your Committee?—He has a scheme which is passed by the Committee.

7593. Approved by them?—Yes.

7594. The same applies to the experimental plots?—Yes. Might I say that I think it would be a very good thing if local Chambers of Agriculture and societies were made to interest themselves in these experimental plots. If a scheme of experiments was carried on through the medium of, say, the Chamber of Agriculture, and if a discussion upon the results took place at their meetings, I think it would be of advantage. That used to be the case at the Cirencester Chamber before the county undertook the experiments. They were undertaken by the agricultural professor at Cirencester as a private individual, and I attribute the fact that the level of farming in the neighbourhood of Cirencester is extremely high, to that, and you do not see so much tendency to use patent manures.

Farmers prefer to use the simple constituents rather than made-up manures. I attribute that very much to the fact that these experiments were carried out by the professor of agriculture at Cirencester in connection with the Chamber of Agriculture, which had at that time an experimental fund. These experiments were carried out over a considerable number of years, and discussion took place once a year or more on the results of those experiments, and the individual farmers at whose farms the experiments were carried out gave their views also. I think if a body of farmers hear from a neighbour, whom they respect as a good farmer and a man of business, the result of some manurial experiment that will have very much more effect than what they see in any printed report.

7595. Is there any co-operative society among the farmers in Gloucestershire?—Yes, there is a co-operative society at Cirencester. This is the second year of its existence.

7596. Do the farmers take shares in that co-operative society?—Yes.

7597a 7597. Do you buy manures?—Yes, we buy manures and feeding stuffs and so far it is a very successful society; it has not a very large membership but it is growing, and it is very successful. Farmers are enabled to make very good terms by joining it, and I think everybody who deals with it is satisfied. I have not said anything about horticultural lectures in this connection. Of course they are chiefly given to adults. I think that more effect is visible from horticultural lectures than from agricultural lectures. You see the horticultural lectures are given by a man who is an expert to people who are not experts; whereas every farmer considers himself an expert in his own business, and is less ready to accept anything from an agricultural lecturer than a cottager is from a horticultural lecturer, and in some parts of the country you can see a great effect from these horticultural lectures in the production of produce for shows; and in the Lydney district they have a horticultural society at which various matters of horticulture are discussed at weekly meetings.

7598. Is the horticultural lecturer a permanent official?—Yes, he is a permanent official now. For about three years we have had a permanent official, but formerly we only had one who gave part of his time.

7599. Do gardeners attend the horticultural lectures?—Yes, generally a few of the gardeners from one or two of the bigger houses attend, and quite harmoniously give their views and criticise the lecture.

7600. The inhabitants of the cottages also attend the lectures?—Yes, there is a very good attendance in some places—60, 40 and so on.

7601. They are a great success?—They are a great success. There are also experimental plots where experiments are carried out on various varieties of potatoes, those are carried out also by the horticultural lecturer, and recently he has been trying experiments on the advantage of using imported seed from Scotland as against the seed grown in England.

7602. Are any lectures given on fruit?—Yes; generally the course is divided into lectures on fruit growing and vegetable growing, and also demonstrations are given in somebody's garden as to the best method of pruning; and in the orchard district these demonstrations take place in orchards, and a very marked effect is visible in respect of the management of orchards.

7603. You give instructions as to how to lay out orchards?—Yes; and how to prune the trees. In Gloucestershire the custom is to let your tree grow according to its natural habit; but I believe, through the influence of the horticultural instructor, there is a tendency to manage the trees more—to prune them more.

7604a 7604. Now, with regard to the education of farmers' sons, you have some evidence to give us?—Yes. I think much more result is to be expected from the education of farmers' sons. Recently, the Agricultural Committee have recognised that the longer the course is, the more good it is likely to do and the more valuable it is. And, acting on that principle, they have enabled the director to devote a certain amount of time every week to three continuous courses. The one at Berkeley is a course extending over the whole winter, six months—about 24 lectures, I think, are given once a week at Berkeley. It is in connection with the prize given by Lord Fitzhardinge. In order to qualify for this prize, the competitors must do well in an oral and written examination on practical agriculture. They must also correctly estimate the relative weights of a number of cattle and sheep and pigs which are submitted

to them, and they must pass their opinion as to the value and soundness of cart horses. They must thatch a rick in the best and most workmanlike manner on the farm, where they reside, and they must execute two perches of hedging and ditching. So that a prize is given not only for a written paper, but also for practical work. Of course, I think these classes are started under peculiarly favourable conditions. You have the incentive of a prize of £10 which is not to be despised; you have also the personal influence of Lord Fitzhardinge and his agent, Mr. Peter, who is an extremely practical man, and who is respected as such in the neighbourhood: he is a practical man, who does not despise science, and therefore it gives these classes a very good start. I do not think we could expect that in other districts we should have quite such easy work. We should not have these influences all tending in the same direction.

7605 Do you give a certificate at the end of the course to those who attend—is there any examination?—I must refer you to our director, whose evidence comes later, for that.

7606. Who gives these lectures?—The lectures are given by our director under the Agricultural Sub-Committee.

7607. Is the Agricultural Committee a Sub-Committee of the Education Committee?—Yes.

7608. You are all members of the Education Committee?—There are some co-opted members.

7609. (By Lord Moreton.) May I ask what the other courses consist of?—I should like to refer you to our director for that. I have heard a great deal about the Berkeley class, but not so much about those at Laverton and Charfield, so that anything I might tell you would be second hand.

7610. (By the Chairman.) You think that these courses might be developed in the direction of a winter school of agriculture?—Yes. I think that is the most hopeful development at present. It would not involve any very great capital expenditure, and, if it was not successful, we should not have committed ourselves to any substantial capital expenditure.

7611. You are acquainted with the winter schools in Holland?—I paid a visit to Holland.

7612. Perhaps you will give the Committee some evidence with regard to these schools?—The winter schools in Holland are carried on in about 10 provincial centres in that country. For the most part they have no actual farm attached to the school; they usually have a small plot of ground on which experiments are carried out on a small scale. The staff consists of the State agricultural director of the province, who, *ex officio*, is the head of the school. He has other duties, of course, to carry on. He has to carry on experiments in the province, and has to advise public bodies who have land as to the management of their land, so that he does not give the whole of his time to the winter school, even during the winter. He has a permanent assistant, who is usually an elementary schoolmaster who has been through a special agricultural course for which provision is made. Those courses are given by the agricultural director as one of his duties. Then there is a veterinary instructor, who is a local veterinary surgeon, who gives part of his time, two hours a week, to each class; a total of four hours a week. Then there is a natural science master from one of the elementary schools in the neighbourhood, who gives the instruction in botany and book-keeping and arithmetic generally, and a science master from one of the secondary schools gives the instruction in chemistry.

7613. The pupils who attend those schools, as a rule, come from the elementary schools; they have not attended a secondary school?—I really could not say but I should think they come both from the elementary school and from the higher Burgher schools.

7614. The instruction given is both theoretical and practical?—Yes. There is no farm attached, but the pupils are taken on the neighbouring farms in order to have practice instruction. The school that I saw, was at Dordrecht; there it was held in a building in the town. There was a small chemical laboratory with simple apparatus; the sort of apparatus that is required in a dairy for testing milk; models of animals and plants for the purpose of teaching animal and plant physiology and so on, but otherwise no elaborate apparatus at all.

7615. They attend for more than one year—they attend for two winters?—Yes, they attend for two winters in succession.

7616. At the end of the second course they can obtain a certificate?—I imagine so. I am rather at a disad-

Mr. E.
Swanwick.
12 June, 1907

7604b

Mr. B.
Swanwick.
12 June, 1907

vantage, not having a knowledge of the Dutch language, and therefore being unable to look up my points in the publications which I brought home with me at short notice. I cannot tell you therefore whether a certificate is given at the end.

7617. In a school that I know a certificate is given at the end. That school is mainly a horticultural school, and to that school is attached what is called a pomological garden, and as the district is a district of orchards the main subject of instruction is connected with orchards and operations in orchards?—Is that the school at Naaldwyck?

7618. No, that is one at a place called Tiel. The director of that school is at the same time what you might call the adviser of the district; that is to say, farmers consult him upon any subject connected with the laying out of orchards. He is at the disposal of the farmers, and it is in his instructions to give advice to the farmers. I suppose you found at Dordrecht also that the gentleman at the head of the school was consulted by the farmers of the district?—Yes. The organisation seems to be exactly similar, except that there is no farm attached. I saw an exactly similar organisation to the one which you describe at Naaldwyck, in the Westland.

7619. That was entirely horticulture?—Yes, entirely horticulture. They had a garden attached to that school which was carried out on scientific lines by a co-operative society of gardeners, and the pupils had free access to the garden.

7620. That is in the grape growing country?—Yes.

7621. You think that schools on those lines might very well be instituted in this country?—I do. I think an important feature of the Dutch system and one worthy of imitation is the way in which the educational resources of the locality are laid under contribution by the winter school, so that where there is a secondary school with an instructor in chemistry or plant physiology their services are made use of; these instructors giving some hours of their time in each week to the agricultural winter school.

7622. The plant at such a school as you have already mentioned, which you called the higher Burgher school, could be utilised if it was elaborate enough for the purposes of the winter school?—Yes. As a matter of fact, I think the school that I saw was independent, and had its own laboratory. It was a very simple laboratory. There is also the point that the veterinary instruction is given by a man who is actually a practising veterinary surgeon in the neighbourhood. I had not quite completed my description of the staff. One important member of the staff is the dairy instructor; he is an officer of the local co-operative dairy. In England of course we have not co-operative dairies in every neighbourhood, but in Holland I expect they have. He gives the dairy instruction; he is a dairy expert.

7623. They admit students to the dairy?—I do not think they have the run of the dairy; I am not sure, but of course it would be a great advantage if they could have the run of the dairy. I heard some criticisms of winter schools in Holland. One of the criticisms was that it occupied the time of the director too much, that the success of the winter school really depended upon the director being able to keep in touch with the neighbourhood, and that if his time was monopolised by the winter school the supply of pupils fell off. I believe the tendency in Holland—I speak of three years ago—is to have what was described as a more or less continuous winter school, that is, a school extending for eight months in the year with a long vacation during the busy period of the year.

7624. Extending the course?—Extending the course, and practically having a man whose whole time is given to the school, not an agricultural director for the province, but a headmaster or principal of the school.

7625. Those schools are attended not only by farmers' sons, but also by the sons of labourers?—I cannot say, but of course in Holland the occupiers are very much smaller than they are in England, and I should think the division between the labourer and the farmer is not so marked as it is in this country.

7626. With regard to the farm at the school at Basing, you have some observations to make?—I see a great advantage at all events in the experimental stages of winter schools by not starting with a farm. I think that a county should not commit itself in the first place to the capital involved in having a farm attached to the school.

7627. You are of opinion that it would be easier to start a number of winter schools if a farm was not added to them?—Yes.

7628. The expenditure therefore being kept down?—Quite so. And then, as agriculture is primarily an industry and only secondarily an art and a science, I think it is an advantage that the pupils should learn their farming at home. As a matter of fact, the people who come to these schools are the sons of farmers. People do not leave other classes of society in order to become farmers, and we practically only want to train the sons of farmers—at least, that is the first object—and I very much doubt whether a model farm can be carried on on economic lines; that is to say, whether a pupil who is a son of a farmer can learn the business of farming better on a model farm than he can at home. I think he requires to be taught the sciences which are ancillary to agriculture. I think he wants scientific instruction, and to get his mind opened so as to enable him to become receptive of new ideas and to carry them out for himself.

7629. The practical instruction given in winter schools should be accompanied by visits to the ordinary farms in the neighbourhood?—Yes. I think if the pupils are taken to visit the best managed farms in the neighbourhood it would be better than having a model farm attached to the school. It seemed to me that the great deal of time which was spent by the pupils at Basing in doing a large amount of manual labour might have been better employed, because I do not think the manual labour is essential, as they will get plenty of that, probably, afterwards.

7630. Will you give the Committee now, some information as to the experiment of a rural science class at the Cirencester Grammar School?—That was taken up as an experiment. Our director approached the headmaster of the Cirencester Grammar School and asked whether it would not be possible to start a rural science class at the Grammar School. The headmaster was not particularly sanguine about it, but he was willing to give the experiment every opportunity. It was started, and the result is that since last September, our director has had a class handed over to him. At first, the class was only for one hour a week and now it is for two. It has been, as far as it goes, a success. That is to say, those scholars who belong to the agricultural class, who possibly have an eye to the scholarships offered by the County, are only too ready to attend this class and are naturally interested in the subjects taught. The headmaster has gone on the principle of drafting into the class, any boy who is likely to be specially interested in the subject. I had, perhaps, better leave it to Mr. Turner to give you a more detailed account of it, but I have it from the headmaster, that so far it is a success.

7631. Then with regard to the technical instruction for farmers' sons and labourers, you think that ought to include classes in agricultural engineering and care of machinery and hedging, ditching and thatching?—I do. An agricultural engineering class has recently come under my notice, and I have been agreeably surprised at the amount of interest shown in it. We have a very good instructor, who was at one time a practical blacksmith, but who also is a man who has had, I should think, a good deal of education. He goes on the principle of teaching them every detail about an agricultural machine. For instance, he takes it completely to pieces and puts it together again as far as the time will permit, and the pupils are taught handiness with tools—how to manipulate them in a machine in the right way.

7632. These classes have been given at various centres have they?—They have been given at one centre previously and now they are being given at the second centre. They are a kind of development of the farriery classes which were principally confined to shoeing and smith's work generally. I think it would be possible to combine with these classes a certain amount of elementary instruction in the principles of mechanics which, I think, for a man who has to deal with machines all his life, ought to be of considerable educational value. I think if he understood the elementary principles of levers, and so on, it would be an advantage.

7633. As regards horticultural instruction, you have short courses at village centres?—Yes; I described those in my instruction of adults.

7634. With regard to the influence of the Royal Agricultural College at Cirencester, on the agriculture of the district you have something to tell us of that in the past, and also in the present?—I described before the effect I attributed to the interest taken in the matter by the Professor of Agriculture and the experiments carried out under the Cirencester Chamber—the influence on the general practice of manuring for swedes in the Cotswold district. Of late years there has been no organised system of experiments carried out by the College in the neighbourhood, and, of course, since county councils have offered facilities to farmers for having food stuffs and manures

Mr. B.
Swanwick.

12 June, 1907

7634_n analysed at a purely nominal rate, the College Laboratory has not been consulted to the same extent. You can get a sample of any feeding stuff or manure analysed for a shilling and consequently the farmer is not inclined to pay ten shillings. Of course, the shilling does not pay for the analysis at all, and it would not be possible for any private institution to analyse cake or feeding stuff at that rate. Consequently, the College has been deprived of this means of really being of use to the neighbourhood. In matters of botany, entomology, plant pests, and parasitic pests, I do not think the College has been consulted by the neighbourhood. In the first place, the professors of botany and entomology are, for the most part, young men fresh from the University who stay for a limited period of years and have not had time to become experts in the agricultural branch of their subjects. It takes a good many years to become an expert in agricultural entomology and in agricultural botany.

7634_b

7635. Is any experimental work done by the College?—At present it is confined to experiments on grasses, which experiments have been carried out for a period now of 15 years, perhaps. Formerly there were experiments on other crops, but of late years they have not been carried out. Generally, there is a small feeding experiment of bullocks and pigs being carried out on the small experimental farm attached to the College, and this year the Professor of Chemistry is trying some experiments on the new forms of nitrogen—lime nitrogen.

7636. Do farmers visit those experiments on the farm at the College?—I do not think so.

7637. Then, as to the character and value of the education given at the Royal Agricultural College to the farmer and to the land agent?—I think the education is of great value to the farmer and to the land agent, but I think at the same time the curriculum is too crowded, and I think the official examinations, such as the examination for the National Diploma, is partly responsible for this. I think the whole education wants focussing more on essentials. Otherwise the result is that you get a somewhat hazy knowledge of a wide field instead of a clear perception and remembrance of cardinal points. I think it attempts too much.

7638. You think it is too ambitious?—I think it is too ambitious—that it covers too wide a field, and does not enter sufficiently into essential details. The time is too much occupied in covering a varied field, and sufficient attention is not devoted to the more important details. It wants putting on a practical basis. I do not know whether it would interest the Committee to hear an instance of the sort of thing I mean.

7639. By all means?—In geology, for instance—I am speaking of my own time which is some time ago—I do not think enough importance is attached to the surface geology as opposed to the geology of strata. I think the time spent in learning how to identify a stratum by means of its fossils is merely waste of time in these days of geological maps. I think, again, in the case of entomology, too much time is spent in giving a complete account of the structure of various forms of insects, and too little time is spent on expounding such books as Miss Ormerod's, which is a practical book on farm pests.

7640. Do farmers send their sons to the College?—Certain farmers do, but the smaller proportion of students are farmers' sons.

7641. And land agents?—Yes; a good many land-owners and land agents send their sons, and a good many men of means send their sons, who want them to take up farming more as a pleasure than as a means of livelihood.

7642. With regard to the information supplied by the Board of Agriculture through the medium of leaflets and market returns, have you any observations to offer?—I should like to confine my remarks to market returns. In the first place, it is more a question of distribution than of the actual matter that is contained in the returns. They always seem to me to arrive too late to be of any use. I have recently been taking the market returns, and in two cases I booked the dates on which they were printed and the dates on which they were delivered. One return was five days late after publication, and the other was 12 days late after publication. I got them from Messrs. Wyman, the printers, and, consequently, I got them, I suppose, in the most direct way. Then I think it is most important that farmers should be induced to pay attention to live weight as a criterion of value. In certain markets animals are bought and sold by live weight, chiefly in Scotland, but there is one important centre where animals are bought by live weight in this country, at Shrewsbury, and I almost

always fail to find any notice of Shrewsbury in the market returns, and in one case where it was noticed, the animals which are sold at such and such a price per live weight were not sufficiently clearly distinguished in order to enable an intending purchaser or seller to arrive at the value of his particular class of stock. For instance, I think it is most essential when you are quoting live weight that you should know that animals of so many cwt. are selling at so much, and that animals of a larger or smaller weight are selling at so much; whereas in the returns they simply stated in this particular case, "At Shrewsbury, Shorthorns from 27s. to 35s. per cwt." That is not enough to enable any practical man to judge of the value of his stock if he wished to buy or sell.

7643. (By Lord Barnard.) Will you complete what you said just now by telling the Committee in what way you would connect the importance of these market returns with the subject of education or instruction. It is more in the nature of information really for the agricultural classes?—That is perhaps so. It is information. Also I think it might be called instruction to farmers—teaching them the importance of live weight and offering facilities to them to buy and sell by live weight.

7644. Is any use made of these returns—or perhaps the director himself will tell us that. Does he use them to illustrate his lectures?—I think, if they were accessible, he would. He ought to try and instil into farmers the importance of buying and selling by live weight.

7645. Are there any other subjects on which you would like to give us information generally?—I think not.

7646. You have given us a most interesting account of the winter schools in Holland. I was going to ask you whether you could tell the Committee for how long a period each of these schools were carried on. You have partly answered the question by stating that in some cases they were extended for so long as eight months. Can you tell us the nominal length of those schools?—I think they are six months—the winter half of the year.

7647. Do they continue throughout the week or are they only held on certain days?—I think they are continued for five days at least—I have a note here, "Five days and six days." The actual hours at Dordrecht were 24 hours for first class, that is to say, first year's scholars, and 27 hours for second class scholars, the second year's scholars.

7648. Do the scholars live at home and come in the morning, or are they in any way boarded in the town?—I think some come every day and some are boarded. I did not hear of any particular system of registering lodgings.

7649. Do I gather it is your opinion that a somewhat similar system might with advantage be adopted in this country?—I think so. Of course, it very much depends on finding a suitable centre which is easily accessible from the surrounding districts.

7650. What you would suggest should be done in the way of providing buildings. I think you told us in one case there was a simple laboratory attached to the school in Holland?—To take Gloucester as an example, we have the use of a block of buildings which was formerly a barracks. We have a dairy school there, and there is a large room above the dairy which might be made use of as a class-room. I do not know whether the County Laboratories could be made use of.

7651. That would only provide for the neighbourhood of Gloucester. You would require more of these schools in the county, would not you?—No; Gloucester is fairly accessible from a large part of the county, but, of course, not from everywhere.

7652. (By Lord Moreton.) From about two-thirds of the county, is it not?—Yes. I should say from quite two-thirds of the county, and further, we admit the principle of travelling allowance in necessitous cases for pupils to come to the schools.

7653. (By Lord Barnard.) You informed us that in some cases part of the instruction was given by teachers from the elementary schools and in other cases by teachers from the secondary schools. Do you think teachers in this country could find the time to do that in addition to their ordinary duties?—The teacher in the elementary school I mentioned is permanently attached as assistant to the director of agriculture; he is a man who commenced as an ordinary elementary teacher but who has taken a special course in agriculture; the other teachers that I mentioned, of chemistry and botany, only give part of their time.

7654. Supposing we adopted such a system in England the part of the time which was given up to this purpose.

Mr. B.
Swanwick.
12 June, 1907

would have to be charged to this particular branch ?—Yes, quite so.

7655. And, therefore, would add to the cost ; it would be part of the cost of carrying on these classes ?—Quite so.

7656. You know, I daresay, the terms of reference to this Committee, to enquire into the existing facilities, and to report whether they are satisfactory and sufficient. I will not go into the question of satisfactory, but do you think the existing facilities in the County of Gloucester are sufficient ?—No, I do not think so ; it would be impossible for us to carry on a winter school with our existing staff, for instance.

7657. I see, on looking at the 1901 census—it is only of males of 10 years and upwards, but, perhaps, that is sufficient for this purpose—a very large portion of the population in your county are engaged in agricultural pursuits, over 30 per cent., which is a far larger proportion than in regard to a great number of the other counties, so that in your county I assume you would want a great development of facilities for agricultural instruction ?—I think so, certainly.

7658. That would require more funds ?—It would, certainly ; we are at the very end of our funds at present.

7659. Is there an increasing disposition, as we have heard exists in other counties, on the part of your County Council to diminish the amount voted for agricultural education ?—Well, there being a shortness of funds there is a general competition for them, and I am rather afraid that the urban classes carry fully as much weight as the agricultural classes.

7660. It strikes me with the very large proportion of agriculturists in your county you ought to get a larger proportion of the "whisky money" ?—Yes, I think we ought, certainly.

7661. I suppose in view of the difficulties at the present day with regard to secondary education, and so on, that is probably not to be hoped for ?—No ; I am perfectly certain it is not.

7662. If the Committee were to say, guided by your evidence, that the existing facilities are insufficient, what would you suggest that the Committee should advise should be the source from which further funds should come ?—As the State admits the principle of supporting collegiate centres I think it might equally admit the principle of supporting centres which have the object of instructing classes which are quite as much concerned, in agriculture.

7663. If it were suggested as the result of this enquiry or otherwise, that the whole system of agricultural instruction should be rather more elaborately organised on a national basis, would you approve of that with counties as the units, if I may use the term ?—Yes, broadly speaking, I think so, certainly.

7664. You would not object to, I will not call it interference, but further guidance and control from the central department ?—No, I do not think so ; that would be a condition of more funds ?

7665. Yes, I do not suggest it unless you get more funds. Are you one of the Agricultural Correspondents of the Board ?—No.

7666. Do you know anything about them ; have you any opinion on the subject of their utility or whether their utility could be increased ? Have you ever come across them, or have you ever had occasion to use their services ?—No. I know the local correspondent in our particular neighbourhood ; he is a man who has made a fortune by farming, as a matter of fact.

7667. Their services might be utilised, perhaps, to some extent in connection with the organisation of agricultural instruction ?—I do not think, if they were drawn from the present class, they would be any good at all.

7668. What is the class in your neighbourhood ?—Successful retired farmers.

7669. I was a little surprised at your saying that it was not necessary to have a farm attached to an agricultural school, in your opinion. Of course, I quite agree with the view you expressed that lads can better learn the manual processes on their own or their father's farm, but do not you think it is of advantage to have such a farm as probably you saw at Basing for the purpose of demonstration, shall I call it ?—Yes ; I think a small out-of-door laboratory, so to speak, is most useful, and also, I think, dairy instruction is very useful.

7670. Do your county give any higher education scholarships ?—Yes.

7671. Are any of those used for agricultural instruction

at places which give higher agricultural education ?—We have a possibility of sending two scholars for two years to a collegiate centre ; and at present we have two men at Reading.

7672. That, I suppose, you think is a useful feature ?—Yes.

7673. If suitable lads could be found probably that might be developed ?—Yes, it is an incentive to those lads.

7674. To put it another way, it would be a very hard case if a really clever lad came under the notice of your instructor, and there were no means of enabling him to further develop his knowledge and intelligence if his parents were unable to send him to a higher collegiate centre—Quite so ; I certainly think there ought to be an outlet beyond the intermediate agricultural school to a collegiate centre.

7675. Then you agree with me that the system of scholarships ought to be developed for suitable lads ?—Quite so.

7676. I am not quite sure what your position is with regard to the College at Cirencester ?—I am an old student.

7677. I was at not all certain whether you were associated with the management of it in any way at present ?—No, I am not ; my father is tenant of the College Farm, so I am more or less associated with it—not personally.

7678. (By Lord Moreton.) Would you tell us about the average age of those who attend the classes at Berkeley ?—I think Mr. Turner would be able to tell you more definitely about the age.

7679. You told us there were three courses at Berkeley, Laverton and Charfield. Have you had any classes in the Cotswold district ?—No.

7680. No courses in forestry ?—No.

7681. Do not you think that courses might be held with advantage in that part of the county ? It is entirely devoted to agriculture, is it not ?—Yes, quite so.

7682. The population is very scanty, and I think it is entirely devoted to agriculture ?—Yes, the farms are mostly large and the population scattered, and I do not think the sons of the farmers would be inclined to avail themselves of the classes as the sons of the farmers round Berkeley do ; they are not so much on the make, so to say, they are rather too well to do.

7683. You mentioned that technical instruction classes had been held for farmers' sons and labourers. I was not quite sure whether you said the first class was held at Gloucester.—The first class was held at Chipping Campden and the second class is now being held on my own farm at Coates, near Cirencester.

7684. You will agree with me that the County Council analyst has practically taken over the work of the college laboratory ?—Yes, the County Council analyst has taken over the work of the laboratory at the college in the way of analysis.

7685. How much do you expect an institution receiving not a single penny of public money to do for the general public ?—I do not expect it. I think it is a pity that there being an institution there it could not be in some way made of use to the general public.

7686. I think you have been very successful as regards your experience at the examination for the National Diploma—I think you passed ?—No, I do not think I did. I went up for the Royal examination, and I believe I made very high marks, but at the same time I did not pass all the subjects.

7687. The senior examination ?—Yes. Might I say now that I think the examination for the Surveyors' Institution offers many points for imitation.

7688. Are you of opinion that it would be better if the examination for the National Diploma could be held in various centres and also if steps could be taken to make it a more practical examination ?—Yes, I think so.

7689. By more practical I mean if a candidate could be examined in botany and entomology and subjects of that nature practically on the land ?—Yes, and there might be a branch devoted to agriculture and to dairying—I think it should be sub-divided.

7690. It is already, as you know, divided into agriculture and dairying ?—Yes.

7691. Have you taken any interest in forestry ?—No.

7692. (By Dr. Somerville.) Can you tell the Committee why the system of field experiments that were conducted by the Cirencester Chamber of Agriculture and which were so successful have been given up ?—It is very

Mr. B.
Swanwick.

12 June, 1907

ancient history; that took place in the year 1870, I think. The experimental fund came to an end and the enthusiasm in the experiments died out. I think it was partly due to the influence of the professor at that time who was Professor Wrightson.

7693. I suppose you consider it desirable in these field experiments that the points should be duplicated again and again?—Yes.

7694. And that the same experiments and demonstrations should be repeated at different centres?—Yes, certainly.

7695. Do you know that the Board of Agriculture have prepared schemes for local experiments and that these have been printed and circulated?—Yes.

7696. Have you found these schemes of any use to you in your district?—I believe the experiments are more or less based on those schemes.

7697. Perhaps you would rather I asked the director about that?—Yes.

7698. I think you have indicated your approval of the course of instruction that is given in connection with the classes at Berkeley, have you not?—Yes.

7699. You, I think, do not approve of the instruction in the practical processes of agriculture as carried out at Basing. In point of fact is not the instruction at Berkeley and Basing very similar, or what is the difference? Why do you approve of the instruction at Berkeley and do not quite approve of the instruction at Basing?—I approve of the instruction at Basing, but I do not think the two are comparable. The boys at Berkeley go once a week and the boys at Basing are spending the whole of their time there.

7700. Yes, but I thought that in connection with the work at Basing you were of opinion that the sons of farmers could best learn the processes of agriculture upon their fathers' farms, and yet I take it that the class at Berkeley is composed to some extent of farmers' sons, and that there instruction is being given in the processes of agriculture?—The class work at Berkeley is theoretical; the practical work is by means of competitions.

7701. Do they not get instruction in the processes of agriculture such as hedging and ditching, and thatching and sheep shearing?—I believe the judge passes criticism on the work done, and they get a grant for hedge cutting and so on.

7702. Do I understand that they do not get the instruction in the processes of agriculture at Berkeley and are only examined in them?—They are only examined in them, but I did not address my remarks to manual processes such as hedging. Hedging is a thing that farmers do require to be taught; it is really more a landlord's matter than a farmer's, and it is consequently neglected by the farmer; he does not care a bit about the hedges as long as they will last his time.

7703. Rick thatching is a thing that is also taught at Basing?—Yes, I think that is a thing that should be taught at local classes.

7704. (By Mr. Latham.) Why do you consider that the lectures to the farmers were absolute failures?—I do not think what I said was quite so unqualified as that. I said they were not so successful as the longer courses and the veterinary lectures.

7705. What you said led me rather to infer that the prejudices of the farmers were so great that the lectures were a failure?—I do not think one gets so much result from them as one would expect.

7706. Might I just ask you to tell us what the lectures were on?—It is an impression; I cannot tell you definitely what lectures were a failure.

7707. I am a farmer myself, and I am rather against the feeling that farmers are so prejudiced that they will not listen to advantages offered to them if they are on the right lines?—Of course, that qualification of yours makes all the difference.

7708. It is a very serious qualification because naturally we do not want to be taught what we feel we can teach?—Quite so.

7709. If the lectures are on sensible lines I think I can say farmers are very much inclined to listen to them?—Yes. Might I say that I think lectures on the purchase of food stuffs and manures, and lectures on how to purchase by unit, and how to arrive at the value of manures in that way are most useful and would be much appreciated.

7710. And again on dairy work?—Yes, I think that is

a matter on which farmers would derive great benefit from lectures.

7711. So that I think I may almost ask you to admit that if the county councils were so disposed and were to get lecturers to go about to the different "market ordinaries" and give lectures to farmers after their meals they would in all probability be successful and be listened to?—They might be. We tried one experiment at Cirencester; that was not particularly successful, but I do not know that you can draw a general conclusion from that.

7712. Were not the demonstrations you spoke of appreciated?—Which demonstrations are those?

7713. You spoke of demonstrations which were highly successful. Did not the farmers appreciate those?—On what subject?

7714. I did not learn on what subject. I particularly noticed you said that on the other hand farmers appreciated the demonstrations?—I think I was referring to experimental plots.

7715. Are not there many lectures that might be given on experimental plots?—Yes; I think in connection with the experimental plots they are most useful. That is rather the point that I wanted to emphasise, that you must have your experimental plot in order to illustrate the lecture and get the farmer to listen.

7716. Your experience has shown you that to endeavour to teach farmers agriculture is a failure; they will listen to horticultural lectures rather than to agricultural ones?—The classes are different in the two cases; it is the smaller man who comes to the horticultural lectures.

7717. It does not apply to quite the same class of man, then?—No.

7718. May I ask you on what lines you advocate this valuing of cattle by live weight. I happen to know Shrewsbury very well indeed, and I think it is the finest market in the country, and I wish the system was compulsory. The teaching of people how to estimate the value of cattle by live weight is a very important subject in agriculture. How would you advocate that should be taught?—I think if the practice was general in markets people would learn for themselves.

7719. You do not advocate it being part of the curriculum that they should be taught how to value animals by live weight?—Yes, the estimating and the judging of the animals by live weight and seeing them weighed afterwards and so on.

7720. Would you take it right through to the butcher's shop?—Yes; in the case of a feeding experiment, for instance. I think the farmer is at a disadvantage as compared with the butcher in estimating weight.

7721. He has not the same experience, possibly. I could not make out what you said about letting a man learn the manual labour after having been taught the better class of agricultural education. Do you think they will take on manual labour after they have been thoroughly educated?—Was it in reference to Basing.

7722. No, in your evidence generally?—I think what I meant was that it was not worth while having a farm in order to teach pupils manual labour when the pupils are drawn from a class who would probably learn manual labour at home on the farm.

7723. I will put it the other way, then, do not you think the practical part of agriculture is very much better taught early in life than later and that the scientific part should be the latter part of a man's education?—Yes, generally speaking, I think so, but I was comparing a farm school with a winter school and taking into consideration the additional advantage to be derived from having a farm attached to a school, that is, whether it was worth having a farm in order to give this manual instruction.

7724. Do you not think that the only way—to speak from my own experience—of teaching a man farming at all is to teach him on the farm; you cannot teach him in a college?—No, quite so, but what I meant was as you are teaching farmers' sons who have an opportunity of learning it at home, is it worth while to have a farm attached in order to have facilities for teaching them the practical part of farming when you might at very much less cost have a winter school without a farm attached?

7725. Then you make the man scientific too early and not sufficiently practical. I have had the pleasure of knowing your father. I know the Cirencester farm very well. Would you give the Committee your experience of the good the farm is to the young men at Cirencester.

Mr. B.
Swanwick.
12 June.1907

What time do they spend on the farm?—I think it is entirely a matter of the individual how much interest he takes and how much time he wishes to spend. Of course there are personally conducted classes which everyone is supposed to attend, but apart from that it is a mere matter of choice how much time they devote to it.

7726. I would be very pleased indeed if you will explain to the Committee pretty much what the life of the student on the farm is?—A large proportion of men come to lectures and spend the rest of their time at games and so on, very often the out-students go back to Cirencester where they have various pursuits I suppose, but they do not spend much time on the farm. Perhaps, three hours a week or an hour a day in a personally-conducted farm class.

7727. I have had the opportunity myself of stopping at Cirencester and seeing the bailiff come in the morning and take those students that were willing round the farm with him. Is that an ordinary thing?—The class is conducted by the agricultural professor; there is no farm bailiff now.

7728. Now with regard to the sons of large farmers in Gloucestershire and your immediate district, you made the remark that they were all affluent or too well off to listen to scientific instruction. Is that so? I find that most of the men who are farming at the present time are pretty much trying to get a living at it whether they are large farmers or small?—Yes, I think they are.

7729. And if education is to be of any value at all, I should have thought those men would have been just the very men who would have been most likely to have profited by it?—It is only an impression. I think you will find that Mr. Turner will more or less confirm my view that they would not probably be so keen as the class of man you find at Berkeley. Of course that does not mean that one ought not to try the experiment on the Cotswolds.

7730. Then with regard to this manual instruction of hedging, ditching and so on, you are under the impression that the competitor when he comes to take his prizes is properly taught, and it is simply to show to the world at large that he knows something of the business in which he is engaged. You do not give any education in hedging and ditching at all, and when he comes to compete for these prizes he is supposed to be fully educated and an expert in it?—In the Berkeley classes I believe there is no previous training.

(Mr. Turner.) They have had for some years a hedge-cutting class, and young farmers instruct one another so far as thatching goes.

(The Witness.) From time to time there have been classes in connection with the Berkeley Hunt in hedging. I was misinformed as to whether there had been any instruction, but it is not given by the county.

7731. I do not think it ought to be myself. I think the farmer himself should give his men the instruction and let them come there to compete. I only wished to know whether that was the line you advocated?—I personally attach great value to classes in hedging. I have seen them in Wiltshire and they have been most successful there.

7732. I think the farmer ought to teach them himself?—He is not always an expert at hedging himself.

7733. Then he ought to be?—He ought to be.

7734. I think you said, going back to your first remarks, that the results were limited to the experimental plots and the exhibits at agricultural shows. What did you mean by "the results were limited"?—I did not mean to say they were very much limited. I was referring to this branch of instruction to adults, and my point was that more result was to be expected from experimental plots than from lectures, or, rather, when the lectures were reinforced by experimental plots there was more result to be expected than when they were not, and also I meant that educational exhibits as bringing the actual results of the experiments before the farmer in a diagrammatic form had a peculiar value.

7735. With regard to the horticultural instruction and your short courses at village centres, is that meant entirely for labourers?—They are open to everybody, but the majority of those who attend are cottagers, artisans and labourers.

7736. You live in the midst of a very large apple-growing district, and there might be lectures given with very great advantage indeed on horticultural subjects to that class of people?—Yes. In the Vale I think they have

a special reference to fruit-growing, and as I say demonstrations are given in the orchards with regard to pruning and so on.

7737. Is that carried out by the Agricultural Committee?—Yes, the horticultural instructor is controlled by the Agricultural Committee.

7738. Is this Agricultural Committee a Sub-Committee of the County Council?—Yes.

7739. Are you a member of the County Council?—No; I am a co-opted member of the Sub-Committee.

7740. What is about the amount of money that this Sub-Committee gets allocated to it by the County Council?—About £1,600, £100 of which goes in scholarships.

7741. Do your scholarships all go to Reading?—We have only given two so far—this is the first year—and they were both sent to Reading. We give the scholars a choice of going to any agricultural school that is approved by the Committee.

7742. You really do not mean what you said that the Correspondents are principally well-to-do farmers and men that take little interest in it?—No. I said the representatives of the class in my particular neighbourhood was a successful retired farmer.

7743. And that they really knew very little about what went on in the district?—No, I think the question was as to what part these Correspondents might be expected to play with regard to any extension of the control of the central Board over education.

7744. I know a good deal about some of these Correspondents and I know they are rather valued than otherwise and I should be very sorry to hear anything said here, which would depreciate the interest of the Board in their Correspondents?—I do not know really the principle on which the Correspondents are selected, as to whether its operation is capricious or otherwise.

7745. I get correspondence from all over the country asking me to put certain questions to this Board on different matters, and I think the system is a good one. With regard to the market returns I am rather with you in what you said. I think they are rather late when they are issued, and that they do not go anything like wide enough. Can you give us any information as to how you would like them to be improved?—I do not think I can give you any useful information except on the point I have mentioned. Wherever there is a possibility of quoting live-weight prices I think that they should be quoted, and that they should be quoted sufficiently specifically to enable anyone who wishes to make use of them.

7746. I do not suppose you would recommend that they should be issued twice a week?—I think it would be a great advantage.

7747. To have them twice a week instead of once?—Of course it is a question of what the cost would be. If I were using them I should like them twice a week certainly.

7748. Are they not more in the shape of statistics than market reports. We get the market reports in the papers, but these are regular statistics which we get all over the country. You think they might be very much added to?—Yes.

7749. (By Professor Middleton.) I should just like you to repeat what you said about the Correspondent. I understood you to say that your local Correspondent was a man who had been so successful at farming that he had made a fortune at it?—That is so.

7750. You were yourself at Cirencester?—Yes.

7751. How many years were you at Cirencester as a student?—Two years and a term.

7752. You gave it as your opinion that the curriculum was overcrowded and that not enough time was given to essential subjects. I should like you to indicate what you consider the more essential subjects for the young farmer are?—Well, for instance, if you take physics the instruction is more or less a text-book instruction in physics. I should like to see the principles of mechanics explained with an actual machine there. I should like to see the application of the principles applied to a machine by somebody who understood both the principles and the machine, and the same with geology, I should like to see more attention paid to surface geology as opposed to a complete knowledge of the strata.

7753. Do you think the student would understand the bearings of surface geology if he had not studied the principles first?—No.

7754. In your opinion, would you improve the course by shortening the preliminary period spent upon principles or by shortening the whole time given to the subject, taking the principles first and the application afterwards?—I think for the agricultural expert it is most essential that he should know both the principles and the application of them. I doubt whether you can combine the education which is suitable for the expert and for the practical farmer. I think the attempt is made, but I doubt whether it is successful.

7755. Your idea would be to make the education for the practical farmer an education dealing chiefly with the application of principles?—He should have a sufficient groundwork in the principles, of course. But, for instance, you know Mr. Fream's book on soils. A land agent is consulted about the purchase of property, and it is important for him to know the agricultural characteristics of the different class of soils, and I think if more attention was paid to the characteristics of soils it would be an advantage.

7756. You think in the study of geology the student could do with less text-book and more of the characteristics of soils?—No, I would not say so exactly; I think he ought to have the groundwork of geological knowledge.

* 7757. That means more time. They attempted to give you both, and you said that not enough time was devoted to the practical application?—I should say so quite unhesitatingly with reference to entomology. I do not think it is necessary to know all about the structure of insects. I think you want to know the particular insect which is a friend or a pest to a farmer. Geology, of course, is a thing which brings in water supply and all sorts of things where a knowledge of the principles is more important.

7758. (*By Mr. Davies.*) From this map you will perhaps observe that Gloucestershire is one of the counties marked white—there is no collegiate centre for higher agricultural education?—That is so.

7759. What I should like to know is, what is the opinion of your Agricultural Committee with regard to that. Have they any scheme in mind either of starting a collegiate centre in one of the counties adjoining Gloucestershire or in Gloucestershire itself, or of becoming attached to some existing collegiate centre?—No scheme has been formulated. I do not know whether individual members of the Committee may have a desire to be attached to some centre, but no scheme has been formulated. The Committee has not discussed the matter as a Committee.

7760. With regard to other educational projects, I mean

to say in sending students to colleges, I suppose they give scholarships for other things besides agriculture?—I believe so.

7761. Are you in any way attached to the University College at Bristol?—I am afraid I cannot answer that.

7762. Supposing at Bristol they were able to develop an agricultural department in connection with the University College, do you think that Gloucestershire would be able to support it to some extent, and to send their students there?—Bristol is at the very extreme end of the county, of course, and geographically it is not the most suitable centre.

7763. You prefer to send your students to Reading?—We do at present, because there is no agricultural centre in our county or group of counties.

7764. So that you regard Reading as your agricultural centre?—We do at present, because it is the only one immediately available.

7765. I think you have already told the Committee that some beginning has been made with scholarships, and that this year you had awarded £100 to send scholars to Reading. Is that policy going to be enlarged in future?—We have no available funds for enlarging it at present.

7766. Supposing the Government made a grant, how would the money be allotted? How would you utilise any money that came to you through a grant from the Board of Agriculture?—If there were no conditions attached?

7767. Yes.—I think intermediate agricultural education ought to have a share before we go much further in the direction of scholarships. I think our scheme would be "top heavy" if we gave more scholarships and had no regular system of intermediate education leading up to higher education.

7768. (*By Lord Barnard.*) You are engaged practically in farming yourself on a large scale, I think?—Yes, about 450 acres.

7769. Your views are based upon your own experience?—Yes.

7770. In addition to that I gather from what you have told us about your visits to Holland and to Basing that you take a great interest in the subject, and have done what you can to inform yourself with regard to it, and the different aspects of it?—Yes. I did not spend a very long time on my visit to Holland.

7771. But still you have obtained a good deal of information?—Yes.

(*LORD BARNARD in the Chair.*)

Mr. DRYSDALE TURNER called and examined.

7772. (*By Lord Barnard.*) You have heard the whole of Mr. Swanwick's evidence, and you will no doubt not repeat anything that he has told us except by way of amplifying what he has already said?—I will not.

7773. You are Director of Agricultural Instruction to the Gloucestershire Agricultural Committee of the County Council?—Yes.

7774. How long have you held that post?—For two years.

7775. Would you tell the Committee what you were before that?—I was brought up with the idea of farming our own land in Somersetshire, where we have a farm. After some years' practical experience I took out the Diploma course at Wye, under A. D. Hall, and then for one year I specialised on soils and manures and plant diseases. Afterwards I was for six years with the Cheshire County Council, first at the Agricultural School, Holmes Chapel, which I joined as a junior member of the staff, and at the end of three and a half years I became vice-principal. Then I was appointed peripatetic lecturer, moving about the county lecturing to farmers, and holding classes in secondary schools. After that I went to the Gloucestershire County Council, as lecturer on agriculture and rural economy, and at the end of the first year they appointed me Director to organise the work, and also to lecture in agriculture when required.

7776. To combine the offices of director and lecturer?—Yes.

7777. You wish to give some evidence on the scheme

of agricultural instruction now being carried out in the County of Gloucester?—Yes.

7778. The first item is that of short courses of lectures on rural subjects. Where are those held?—At various centres all over the county.

7779. What is the length of them?—Two to four lectures given one evening a week.

7780. I suppose they are held in schools?—Yes, at convenient centres. The Local Committee has to find a suitable room.

7781. Are they well attended?—Most of them are well attended.

7782. By what class of people?—I am speaking now of all the subjects—agriculture, poultry keeping, horticulture, and so on. Collectively they have been very well attended during the past winter.

7783. I suppose they are attended by the different classes who are interested?—Yes, they are attended by the different classes who are interested—farmers, labourers, and in certain districts like the Forest, by the pitmen, and also by the operatives in the urban districts.

7784. Do you find the audience take an interest in the lectures and ask questions about them when they are over?—Yes, at the end of each lecture we always have a discussion and numerous questions are asked.

7785. Is there anything else you wish to say on that point?—The only thing I wish to say with regard to the short courses in our scheme of agricultural education is, that I consider they are useful in arousing

Mr. B.
Swanwick.

12 June, 1907

Mr. D.
Turner.

Mr. D.
Turner.

12 June, 1907

interest, but that they do not leave a very permanent impression afterwards. I mean to say they open up an interest in the various districts and there the matter ends. In Gloucestershire, it must be remembered, we are not so far forward as regards agricultural education as in some other counties, take Cheshire for instance; and we have had a great deal of prejudice to break down. The short courses have proved of value in rousing up an interest in the work, but in most cases, as I have already said, there is no very permanent mark left.

7786. Might I ask if, in your opinion, this leeway could be made up as it has been in Cheshire and that the County of Gloucester will in due course more and more appreciate the value of agricultural education?—Yes, I think so, and I have noticed a tendency in that direction during the three years I have been there.

7787. Then about the long courses—what are they?—They are in the form of winter classes in the evening especially for young farmers.

7788. How many of those do you hold in a year?—Last winter I had three courses at Berkeley, Laverton, and Charfield. Of course, my time is somewhat limited; I could have arranged for more, but with the time at my disposal I was only able to have three courses—three nights a week.

7789. Were they well attended?—They were very well attended. At Berkeley we had about thirty on the register, and at Laverton an average attendance of twenty. There was a smaller centre at Charfield to which half a dozen young farmers came regularly.

7790. Did they take an interest in it?—Yes, and asked numerous questions.

7791. Have any of them made any remarks to you, subsequently, as to whether they had derived any benefit or as to whether it had opened their minds at all?—Yes, they have asked me to visit their farms, and to discuss certain matters with them, which is about the best sign of the good results of your work that you can have. They have asked me to go round their farms with them and to give them advice on manures, feeding stuffs and other matters affecting their practice.

7792. What was the duration of those courses?—There were 24 classes at Berkeley from October to March; the others I had to cut down to 12.

7793. Those come under the first head—winter classes for young farmers?—Yes.

7794. The second head is "Classes in secondary schools." What do you mean by that?—The classes we have started at Cirencester Grammar School. Cirencester Grammar School is a school largely attended by farmers' sons who come from the Hill district. Some years ago they tried a scheme at the Grammar School with an agricultural side, but it was a failure. When I came into the county I thought there might be an opening for doing some useful work in the secondary schools. We had such classes in Cheshire in the agricultural districts with very good results; and with the object of developing the same kind of work in Gloucestershire, as Mr. Swanwick pointed out, I paid a visit with him to the headmaster of the Grammar School and proposed that we should have a class. He was not very sanguine about it, but he consented to try it as an experiment, and last September we started a class for one hour per week, and we have now increased it to two hours, as it has gone so successfully.

7795. It has gone successfully?—Yes.

7796. It would be very valuable to the Committee if you would inform them what your opinion is as to the future of that experiment—whether you think that is an experiment that could be usefully developed all over the country?—I will go as far as this, that I think it might be usefully developed in other secondary schools in our own county.

7797. Do boys who come to these classes carry out the work in lieu of some other item in the curriculum, or is it an additional subject?—It takes place in the school hours, and they have to sacrifice some other subject, either English or geography; I will not be certain which. Different boys sacrifice different subjects, and they work this in as a special subject.

7798. Do they pay any extra fees for it?—No. I might say with regard to the Hill district we have not had any evening classes for young farmers, and one of my ideas in going to the Grammar School, was that I should catch some of the boys from the Hill district.

7799. You have something to say on the subject of

experimental work?—Yes, that is another branch of our work. We have developed throughout the county experiments at various centres.

7800. By experiments I suppose you mean what we have got rather to differentiate here as demonstrations?—Yes, demonstration plots, I ought to say. Demonstration plots have been set out in various centres throughout the county. In Gloucestershire there is such a variety of soils that it is specially adapted for the purposes of demonstration plots, and we find that they stimulate interest among men who would not otherwise think of coming to a lecture. Supposing there is an experiment on pasture land for instance, they will ask questions about it, and on market days they will come and have a quiet chat with you as to the cause of the poorness of their pastures, and so on.

7801. Have you anything to add to what we have heard this morning from Mr. Swanwick with regard to agricultural scholarships?—Agricultural scholarships give a chance to the cream of the young men who attend these winter classes to take out a complete course at a higher institution. We have two at present, and we hope to be able to give four this year.

7802. I suppose your county adopt the usual formula in the case of secondary schools of saying that such scholarships shall be tenable at any school or college approved by the Council?—Yes—approved of by the Agricultural Committee.

7803. Not limited, of course, to Reading?—No. They give them quite a free field to go wherever they like.

7804. Have you offices in the County Council buildings?—Yes. I have an office at the County Education Offices.

7805. You consider that your office, I suppose, should be used as a bureau of information for the county?—Yes.

7806. Have you a clerk?—I have a part time clerk.

7807. Do you consider that that office might be usefully employed in the way of collecting and disseminating agricultural information generally for the benefit of agriculturists in the county?—I do. I get a number of enquiries coming to me. For instance, a man came to me the other day and said there was something wrong with his oats; he thought they were "rusty," and would I go and have a look at them, and advise him what was wrong. I went over and found that it was not rust at all, but that it was an attack of the frit fly.

7808. If every county had such a bureau I suppose you would agree with me it would be of great advantage?—I think that such bureaux might be usefully developed in other counties for the purpose of giving information on such matters as I mentioned just now. They might also be useful in tracing outbreaks of plant diseases, etc.

7809. Yes.—For instance, we found our bureau useful since the outbreak of American gooseberry mildew. We were told that we had that in Gloucestershire, and we could not find out where it was till we traced it.

7810. Would you approve of all these local offices being linked up together by some kind of central institution in some form or other?—It would certainly facilitate matters.

7811. So as to interchange information and avoid duplication?—It would simplify the machinery for distributing information, and make matters work with greater acceleration.

7812. Now with regard to the dairy school. That is a fixed school, is it not?—In Gloucester it is. It has been running for a number of years. That is the oldest agricultural work we have in the county.

7813. Is it only for girls, or do you take men as well?—We do take men, but it is principally attended by young women.

7814. How are the courses arranged?—Ten classes make a course. We do not take a great number at a time, generally about half a dozen. There are butter-making and cheese-making courses, and farmers' daughters from the Vale district can come up on specified days and take the course to fit in with their farmhouse arrangements at home.

7815. These students come by train, I suppose?—Yes; there is a very good train connection now with the Vale district.

7816. Will you now tell us about the Cider Institute at Long Ashton?—That has aroused a good deal of interest in the county. We generally have a number of people to visit it each autumn, including many farmers. This spring we had a large party who went to taste the cider

that had been made. Most of the cider makers also take an interest in it.

7817. Is there much cider made in the County of Gloucester?—Yes, in the Vale, not on the Hills. It is quite an industry.

7818. There is therefore scope for a great deal of useful work in that direction?—Yes, for useful information to be obtained and disseminated.

7819. Are you associated with the work of the Bath and West?—We give a grant towards the Cider Institute, so that we are one of the contributing counties.

7820. (*By Mr. Latham.*) The Cider Institute is not under the County Council, is it?—No there are five contributing counties, and the Board of Agriculture also makes a grant. The Cider Institute is a limited company.

7821. (*By Lord Barnard.*) That is practically all you have to say upon the existing facilities for agricultural instruction in the county?—Yes.

7822. Now you wish to draw the attention of the Committee to what you consider are the weak points in the present system?—Yes.

7823. The first item you put down here is "Short courses leave little permanent impression." I think you have a ready referred to that?—Yes, I have touched upon that already.

7824. Then the next item: "The variation in attainments between the farmer's son who has attended a secondary school, and the young labourer who has left the elementary school a longer or shorter period"?—In starting a winter class you get these young farmers and labourers, and they are all of different calibre, as regards intellectual attainments, and there is a certain amount of time wasted in going over elementary work to bring them into line before you can instil into them some of this technical work. For instance, if you are going into the question of manures it might be necessary to touch on the unitary method, and to put in a little instruction of that kind. There is a variation in the intellectual capacity of the students, and we find it rather a nuisance in starting these courses. At Berkeley they are more advanced, but in some of the other parts of the county where I take evening classes it acts as a sort of drag on the amount of work you can get through in the winter.

7825. I do not know whether you can suggest how that should be got over?—I have touched on that in the scheme for continuous evening school classes to be considered later.

7826. Then there is a need of continuous courses and a centre to work to?—Yes. In going about to these evening classes I have to go all over the county. We have not got any fixed centre equipped with proper apparatus. What apparatus I require I have to take with me, and it would be advantageous to the work if we had a centre of this sort in Gloucester itself, with specimens and apparatus, where you could get the young men to come up to from the Vale and elsewhere.

7827. With regard to facilities in the County of Gloucestershire for higher agricultural instruction, they are more or less defective at present?—They are at present, but of course the work has not been developed very long.

7828. I do not know whether you can give us any information with regard to classes for elementary school teachers?—We have not done anything in that direction

up to the present, but I have been talking over the matter with our Secretary of Education lately to see if we could not do something next winter, but so far we have not touched it at all.

7829. Are you of opinion that it would be desirable that all elementary school teachers who are to work in rural districts should have some instruction in rural subjects, and that it should form part of their curriculum?—Yes, if they have a desire for it.

7830. You do not think it should be compulsory?—I do not think they ought to be forced into it. If they have a liking for it I think there should be facilities offered to them to acquire a knowledge of these subjects.

7831. I am rather speaking of the training of the prospective elementary school teacher?—I think it would be a good thing to have definite courses for them. The man who was going to be a rural teacher would then have to specialise as against the man who was going to be a town teacher.

7832. That would be a difficulty, would it not, because some teachers no doubt at some time or another might wish to change from one to the other?—In taking up his course the prospective teacher would have to select at first which branch he was going into, but if he wished to change afterwards his training in rural subjects would not debar him from teaching in the towns. He would have to specialise at first at any rate in order to get his diploma for rural teaching. But a course in rural subjects, however, I do not think would hurt the town teacher as it would develop the mind, by training him to observe and think for himself.

7833. You are of opinion that you ought to have a winter school of agriculture?—I think that would be the best immediate development, and that we are now prepared to take a step in the formation of a permanent centre.

7834. What is your opinion as to how the finance for such a centre should be provided?—Of course at present we are working with very limited means. Mr. Swanwick has already touched upon that matter. If it is made a national question, then we should ask for a grant from the Treasury, perhaps to come through the Board of Agriculture subject to their inspection and recommendations.

7835. Such a school would be a development, then, of the bureau of information which you referred to?—Yes.

7836. As well as having for its object the instruction of lads and lasses?—Yes, we could combine the two.

7837. You think the whole work of giving information to farmers and obtaining information for them goes hand in hand?—I have found it so in Gloucester.

7838. You also think it desirable that there should be an arrangement for permanent trial grounds to be instituted at certain centres typical of the farming of the county?—Yes. We are not perhaps sufficiently developed to institute a college straight away with a farm school attached. No doubt if we had the resources and the means a college with a farm school would be desirable, but at present I think an arrangement for permanent trial grounds at various centres on the different soils of the county would be the best way of continuing the work.

7839. We have a witness here who has come specially and whose time is very limited, and we should like if you would allow us to interpose him now and complete your evidence a little later?—Certainly.

*Mr. D.
Turner.*

12 June. 1907

(Lord REAY in the Chair.)

The Rt. Hon. Lord FITZMAURICE, called and examined.

7840. (*By the Chairman.*) You are prepared to give the Committee some information with regard to agricultural education in Wiltshire?—I am. I understand the Committee thought that it might be of use if I were to state briefly how the agricultural education work is done in Wiltshire and the origin of those arrangements. It is chiefly in regard to their origin, upon which I think my evidence might be of use rather than in regard to the actual education itself. I rather feel if I went further that I should be trespassing upon the province of the Chairman of the Committee, Mr. Phipps, who is an admitted authority in my county. I understand that

there is a reasonable chance of his giving evidence here, so that I would ask the permission of the Committee to confine myself to the manner in which this work is done and how it commenced. It began originally under the old Technical Instruction Acts. I was at that time Vice-Chairman of the County Council, and with the support of the late Marquis of Bath, the Chairman, whom I succeeded in 1896, I proposed on the 10th May, 1893, that a separate Agricultural Education Committee should be formed to take off the hands of the Technical Education Committee all or any work connected with agriculture. I was supported by several leading tenant farmers,

*Lord
Fitzmaurice.*

7840a

Lord
Fitzmaurice.
12 June, 1907

both on the Council and outside, but there was very far from unanimity, and the first attempt, although my second was a large and influential farmer in South Wiltshire was defeated. Up to that time I ought to say the work had been done by a small sub-committee of the General Education Committee. I returned to the charge on January 25th, 1895, and I was successful. The recommendation of the Committee was approved by the County Council on August 6th of the same year, and that arrangement continued during the whole period when the education was worked under the old Technical Instruction Acts. Wiltshire was the first county to appoint an entirely separate Agricultural Education Committee, but very shortly afterwards (I have not got the exact date) the County of Somerset followed our example. There was established in those years most of the things which are working now—a butter school, which is still in existence and has gone on ever since; a cheese school working for some time, but temporarily abandoned; a farriery school, which still goes on, and itinerant instruction in poultry and gardening, all of which go on. Certain scholarships were founded tenable at the Dauntsey Grammar School, and the County Council, on the recommendation of the Agricultural Committee, voted £1,000 in aid of the Dauntsey School, in order to establish chemical laboratories as well as founding the scholarships. The County Council, also on the recommendation of the Committee, gave a grant of £100 a year on maintenance account to the Dauntsey School, which has continued ever since. That was the state of things when the discussions on the Bill of 1902 commenced. When the celebrated Clause 17 as it now stands in the Bill came to be considered, it appeared that it would be in the power of a County Council if the Bill passed to establish two Committees, and therefore to maintain the system which had been established in Wiltshire. There was, however, some doubt about it in the minds of legal authorities, and I therefore exerted myself in the House, and I received very valuable support from Mr. Henry Hobhouse, to make it perfectly clear in the Committee stages of the Bill that that arrangement could be made; that is to say, that we should be able to continue our Agricultural Committee as a separate body with a separate grant out of the higher education funds. In that, especially as the Government were friendly and stated that that was what had been their intention, I was successful, and the Bill passed in the shape in which it now stands. Our Agricultural Education Committee was reappointed and received a delegation under the opening words of Section 17 of the Act to do everything in the county connected with agricultural education except some rather humble attempts we had made to teach gardening and things of the kind in the primary schools. That, in the opinion of the Director of Education was best left, owing to its very elementary character, under the General Education Committee. The funds of the Committee are but small. I had hoped to have brought the exact figures here with me, but I am sorry to say some papers that I expected to receive this morning have not reached me, and if the Committee will allow me I will fill in the figure afterwards or Mr. Phipps can give them. There is naturally a constant tendency to struggle over the amount between the Agricultural Education Committee and the General Education Committee, and the Finance Committee of the County Council has nearly every year to act as a sort of arbitrator. I am bound to tell the Committee that the position gets more delicate every year, because as the work of each Committee increases, and the “whisky” money has fallen off also the county has been obliged to levy for the last three years a higher education rate. Under those circumstances each Committee is very anxious indeed to establish its claim to a full share of those sums, especially to the sums arising out of the county rate, which many of the farmers, who are naturally an influential body on the Agricultural Committee, claim ought to be a sort of happy hunting ground of their own. They take more interest in agricultural education than in other education, and they claim that they are the largest ratepayers in the county, and that payments should be made out of the rate money for agricultural education. I do not view these claims with any disfavour because it is an immense thing that the Agricultural Committee has really interested many people in Wiltshire who before were not interested or even friendly to education. At first this Agricultural Committee was a little laughed at and sneered at, and as I have said the first time I brought it forward I was defeated, and defeated by the votes largely of agriculturists. Some three years ago when there was a great cry of economy in the administration of the county, and the economist party cast about to see what

they thought they could attack with the greatest chance of success, they made a set under rather powerful leadership upon this vote for the Agricultural Committee. They raised up some amount of feeling among the agriculturists in South Wiltshire, who, doubtless, do not benefit as much from this expenditure as the rest of the county. They do not benefit so much in this way, that the farmers there are very large farmers, large sheep farmers, and very large holders of land. The butter school, for example, does not interest them so much as it does the smaller men in the rest of the county, and they became parties to this attempt to economise this expenditure and to throw it into the general revenue of the county so as to reduce the rate, as it would have, but by not I think more than ½d. in the £, which was one of the things pointed out to them. However, the attack was a complete failure. The Committee courted discussion both in the County Council and outside, and an influential and leading Conservative paper, *The Devizes and Wiltshire Gazette*, which is always written with great impartiality on all questions of County Council government and finance (being on the other side, I am very glad to have the opportunity of saying it), sent out a circular to a large number of agriculturists in all parts of the county. The replies, though they were not absolutely unanimous, were quite overwhelming that the work of the Committee was useful to the agriculturists, and was increasing year by year in utility and in the hold it had on the popular mind. The result was that since then, although the economists at this moment are engaged in attacking other branches of expenditure which they think they can reduce, they have entirely abandoned the attack on the Agricultural Committee, and I feel that the Agricultural Committee is now perfectly safe from further attack. I say that subject to one observation and that is that being a branch of higher education it is involved in the common danger and in the same difficulties which all higher education is now involved in by the continued growth of the elementary education rate. The elementary education rate is going up by leaps and bounds in most counties in the South of England, and the ratepayer has no doubt got very sore on the subject, and that being so he is, if I may use the expression without being misunderstood, like a bear with a sore head, and he looks round to see where he can get something to reduce. He is very much inclined to rush blindly at the higher education rate generally. We had an instance of that this very year in Wiltshire. There was a proposal made to resist the levy of a higher education rate altogether, and when we pointed out that if they abolished the higher education rate they would amongst other things entirely disorganise the work of the Agricultural Education Committee, they disclaimed any wish to do that, but they said the Agricultural Education Committee could very well keep itself going by the grants from the “whisky money.” They said, “What we want to reduce is the expenditure upon the secondary schools and everything of that kind, at least as long as the elementary education rate goes on increasing by leaps and bounds.” I am not inclined to think that we are free from danger as long as the elementary education rate keeps up its present high level, and continues to increase during the next one or two years, until the salaries of the elementary schoolmasters have reached what may be called summit level under the new scale which the County Councils are adopting. That is the present position of the Education Committee. I may add in addition that although we were told at one time that we were violating the law we have succeeded to a certain extent in turning this Agricultural Education Committee into a general agricultural committee. Our legal advisers have pointed out to us from time to time that we are running rather dangerously near violating the law, because the money is allocated by law to education, and it is not always made clear that it is expended in education—for example, giving prizes at the shows and other branches of work of that kind. We have got over some difficulties by an arrangement under which the same persons who have been appointed on the Agricultural Education Committee by the County Council, with the exception of the co-opted members—the additional members as they are now called—are re-appointed to be the County Council Committee for such purposes as the Fertilisers and Feeding Stuffs Act and matters of that kind. The Committee first of all meets as an Agricultural Education Committee and does that work, and then if there are any of the co-opted members present, they either leave or remain in the room to listen to the discussion if they care to, and the Committee then sits as the Fertilisers and Feeding Stuffs Committee. I was talking to Lord Fortescue the other day about it. He enquired on

behalf of his County Council what we were doing, as to how far it would be possible to carry that organisation a little further, and whether it would not be a desirable thing if we could not get some statutory organisation by which one Committee could take agricultural education, the Fertilisers and Feeding Stuffs Act, and the Cattle Plague Regulations and that sort of thing, so that one Committee of the county could be looked upon by the farmers as their Committee. We have taken the first step in that direction as I have described with regard to the Fertilisers and Feeding Stuffs Act; and it has worked very well. That is the present state of things, and, of course, if I can answer any further questions I shall be very glad to do so.

7841. You are of opinion that a separate Agricultural Committee has a great advantage over an Agricultural Committee which is a Sub-Committee?—Judged by our experience in Wiltshire I think so certainly, for the reasons I have given that it brings into line a great number of persons who otherwise I think have no special interest in education.

7842. Are any farmers on the General Education Committee?—Yes, but naturally they prefer being on the Agricultural Committee.

7843. You have no difficulty in getting farmers to serve on the Agricultural Committee?—No, no difficulty at all now.

7844. Have you reduced the grant in recent years for agricultural education—after the Act of 1902, for instance?—I have not, I am afraid, brought the figures with me, but I could easily put them in, and I would ask permission to do so or Mr. Phipps will give them. The grant for agricultural education during the last two years has increased. The Agricultural Committee tried very hard both last year and this to get a substantial increase, and they got a small increase. They would have got a larger increase, but it became clear that something must be given up, and the General Education Committee did not wish to give up certain things, in order to find more money for the Agricultural Committee. The only thing that was given up a few years ago voluntarily—it was considered better to give it up on the merits temporarily—was the cheese school. There has been a great change in regard to the making of cheese, as no doubt many members of the Committee are aware. The old North Wiltshire cheese, which used to be a staple article of produce in the whole of the northern part of the county, I am sorry to say is now going out. When the cheese school was first set going we had a Cheddar cheese school and a Wiltshire school. The Cheddar cheese school was more successful, and it went on for some years, but when it was found necessary to make reductions the authorities in the county thought it would be as well to give up the cheese school, at least temporarily, because they thought it had done its work for the time, and that it could, if it was found necessary, be taken up again a few years hence. So far as I remember we were able at that time to extend work which we had not originally begun with in the way of hedging and ditching and thatching, which proved to be very largely appreciated.

7845. I suppose one reason for the decline in the making of cheese is that farmers have found perhaps a more profitable market for the disposal of their milk?—Yes, they send the milk up to London. I may say that I was at the County Show the other day where there was a very large exhibit of cheese, and I noticed that there was very little North Wiltshire cheese indeed shown.

7846. Are you satisfied with the way in which the grants are given by the Board of Agriculture and the Board of Education?—The amount of grant which comes directly to the Agricultural Education Committee is exceedingly small, and that is one of the reasons why, a rate having been levied, the farmers not unnaturally say they ought to get a fairly large slice out of the rate for Agricultural Education because so very little can go to it from the “whisky money.” The “whisky money” is nearly all allocated to strictly educational things, such as secondary schools and technical classes and things of that kind.

7847. Do you think the Board of Agriculture should be in a position to give grants to the various Agricultural Committees?—I would be very glad to see it, but if I am asked my own general opinion as to what I believe would really help all branches of higher education, including agricultural education more than anything, it would be if something could be done to reduce the high level, and therefore the unpopularity of the elementary education rate, because, as I said just now, the ratepayers in the rural districts are

in a very sore state about this high rate, and the result is that they want to economise everywhere else. If you could get the elementary education rate down, say, 3d. or 4d. in the £, I believe one half of the difficulties we have had during the last three or four years in regard to collecting money for higher education and for agricultural education would disappear. The ratepayer is, as I ventured to use the expression before, like a bear with a sore head; he is angry and he casts about to see where he can get the rates down somehow or other. I had one man after the other telling me the other day that they were not voting against higher education, but what they were voting against was the elementary education rate. I told them I thought it was very foolish of them, but that is what they said, and they appeared to be perfectly genuine.

7848. (By Lord Barnard.) Could you tell us whether this Committee that you mentioned acts as the Executive Committee under the Diseases of Animals Act?—No, I wish I could. The Clerk of my Council, who is a trained lawyer, has always seen very technical difficulties in doing it, and Lord Fortescue, who came to me the other day to get this information, put the same question. He seemed to be trying to get over these difficulties, so as to endeavour in Devonshire, which is his county, to make the Committee representative of all branches of agriculture. I also noticed the other day in the Agricultural Committee that the present Marquis of Bath expressed a strong opinion that the Committee was constantly hampered by the fact that being an Education Committee it had always to be looking at the Acts of Parliament to ascertain whether it was not breaking the law by doing something that was not strictly within the letter of agricultural education.

7849. I gather with your great experience of local government, and particularly County Council work, that it is your opinion that agricultural education work (especially that part which has to be done through the intervention of a Government Department such as the Board of Agriculture) might with advantage be in the hands of one committee in the case of the whole of the county?—That is my decided opinion, and one reason for it is this, that anyone who has to do with County Council work knows the great difficulty in connection with it is in the large distances which members of the Council have to travel in order to attend the Committees. If you could get a sufficiently long agenda to make it worth the while, by concentration of the work, of the members to come, they would be inclined to attend regularly. Very many of the members travel considerable distances to do work which might be done in an hour or an hour and a half. The Committees never last very long, and I am of opinion that if there were more concentration and members of the Council, instead of being brought one day to attend a Committee on the Diseases of Animals, and another day on the Agricultural Education Committee, another on the Fertilisers and Feeding Stuffs Act Committee could have all that on the agenda of one Committee it would make it worth while for people to come.

7850. If I may venture to say so, I am very strongly of the same opinion. You do not have any grant from the Board of Agriculture?—No, there is no direct grant.

7851. You have no field experiments or any farm in your county?—You may call these hedging and ditching and thatching field experiments.

7852. But no manurial experiments?—I think there is something of that kind going on now, and there was formerly, with potato cultivation and so on. I am not a practical agriculturist, and perhaps Mr. Phipps will be able to tell you about this with much greater authority and knowledge than I can.

7853. One of the witnesses that we have had before us has told us that in his opinion there should be an authority which should not only have the charge of agricultural education, but should become a bureau for the collection and dissemination of scientific information, that is for the benefit of grown farmers as well as lads—I suppose your opinion would be that this Committee could undertake that, too?—Yes, I think it could. Some years ago I remember Mr. Story Maskelyne (a very great scientific authority, and also a landowner and agriculturist, and who really was in some ways the father of the work of this Committee), in conversation, pointed out how advantageous it would be if ultimately we could in some way or other tack on what in America would be called an observation station to the Dauntsey school. I hold that the Dauntsey School, with the help it gets from the county, ought to have a very great future before it. Our finances are rather hampered, because we have a large loan

Lord
Fitzmaurice
12 June, 1907

Lord
Fitzmaurice.
12 June, 1907

to pay off, but we are on a very sound financial basis, and if the Mercers' Company, who are the real founders of the Dauntsey School, continue to take an interest in it, and give a larger support to it still, and the County Council do the same, I hope that at Lavington we might found a very desirable observation station connected with the School.

7854. (*By Mr. Lamont.*) As a County Councillor I should like to ask you one question. I think you said that you thought it would be desirable if the Committees of the County Council on Agricultural Education and the Fertilisers and Feeding Stuffs, and on the Diseases of Animals Acts, could be amalgamated and worked together, so as to make a rather longer and certainly more interesting agenda?—Yes.

7855. I suppose you would be willing that the Small Holdings Committee should also be joined?—Certainly. The difficulty is only a technical one, that is, the difficulty with the co-opted members, and we have got over that in the way I have described. The Act of Parliament says there shall be a separate Committee, and we have to go through the rigmarole of appointing the Committees over again. We always take exactly the same people, but it means that I have to put two motions from the chair.

7856. Legislation would be necessary to enable the same Committee to be appointed for these various purposes?—Yes, and it would require some careful drafting, because there are a lot of legal pitfalls, and you have to be very careful in a matter of that kind, because naturally the Clerk of the Council is rather nervous for the time being, and it is right that he should be so, because he does not want to involve the Council in expenditure which the auditor would disallow the next year as not being within the purview of the Committee. We are kept in very tight order by the auditors, and we always live in fear.

7857. You would agree, if this were possible, not only would there be an inducement for men who are interested in the various branches of agriculture to belong to the County Council, but also to attend the meetings regularly and give their time to the Committee?—Yes, I quite think that. With the Diseases of Animals Committee, for instance, it would be an additional advantage, for this reason, that under the archaic Acts of Parliament under which that Committee is formed, it is a rather unmanageable Committee in size, and you would get a more concise and compact Committee if the other method were adopted.

7858. (*By Mr. Latham.*) I cannot quite agree with you about the appointment of the Committees not being made annually. Of course you know men die, and we get square men in round holes and so on, and men who wish to retire, and I think it is highly desirable that these Committees should be appointed annually?—I did not say otherwise.

7859. I thought you said they ought to be appointed permanently?—No, I did not say that.

7860. With regard to your remarks as to elementary education, I suppose everyone will agree with you that it is absolutely essential to get some relief as regards elementary

education?—It would be rather dangerous perhaps for me to express an opinion. I have perhaps gone rather far in expressing my opinions already.

7861. You do not wonder that it is a sore question with the ratepayer?—No, I do not wonder at it. I have always expressed the opinion that a larger portion of the elementary education rate ought to be placed upon the Exchequer. No doubt the members of the Committee are aware the present system is one which bears peculiarly hard upon progressive counties. Some counties, most, not all, have put their teachers upon a regular scale, and they will all have to do it eventually, because a county that does not put its teachers on a scale naturally runs a risk, almost a certainty, of all the good teachers in the county going off to some other place where there is a scale of good salaries. The counties which started first with a reasonable scale, and those which have paid their teachers if not on a liberal on a well-considered scale have suffered most.

7862. Do you not think it would be a better system to have a uniform scale?—Yes. But you know how it began. The great County Boroughs, who were very rich compared with agricultural counties, started it, some people thought with very high scales, and the Act of 1902 had not been in operation a year before one began to hear of teachers looking wistfully over the border into the County Boroughs and wishing to go away and obtain posts there.

7863. May I take it that the system you advocate with regard to the Committees would divide the Council into about two or three important bodies?—I do not think it would go very much beyond concentrating the work of the Committees, the names of which have been mentioned, that is to say, the Agricultural Education Committee, the Fertilisers and Feeding Stuffs, the Contagious Diseases of Animals, and the Allotments and Small Holdings.

7864. You would have a division between Education Committees and Committees dealing with roads, bridges, and so on?—Yes, I would leave it as it is.

7865. And then have one large Committee to take up these other several matters?—Yes.

7866. Do you think that would work?—I think so; it would not be such a very large committee.

7867. I am afraid we should lose some of the best men on some of the committees which we want on almost all of them?—Yes. The work of the County Councils is increasing very largely, and as Lord St. Aldwyn said in the House last year in the debate on the Education Bill, only those who were concerned in County Council work knew or fully appreciated how great and how constantly increasing the work thrown upon County Councils was.

7868. Lastly, we may come to the conclusion, from your evidence, that you would like to see a rural party and an urban party with regard to County Council work?—No, I do not put it in that way. I think it is a very important thing to have a Committee specially for the education in which the rural mind is particularly interested.

(*LORD MORETON in the Chair.*)

Mr. DRYSDALE TURNER, recalled and further examined.

Mr. D.
Turner.

7869. (*By Lord Moreton.*) Would you continue your evidence from the point at which you left off?—I was referring to the institution of permanent trial grounds at certain centres in the county in conjunction with a winter school as the best way of continuing the work. I should suggest permanent trial grounds, perhaps one in the Vale, and another on the Hills. We have no permanent hold on the farms we are now experimenting on, we are only permitted there by courtesy, but if we had a ground of our own for which some grant was made, we should then be in a position to carry out continuous trials. For instance, there is a great deal of poor pasture land in Gloucestershire. At the present time I am conducting a series of experiments with manures on pastures, but I am beginning to feel the need of more permanent experiments such as the Tree Field experiments at Cockle Park or experiments similar to those which Professor Middleton has carried out at Cambridge. You require for that purpose permanent ground with which you can do more or less as you like. If we had such a trial ground we might also have a model

orchard, where demonstrations on planting, pruning and so forth could be carried out.

7870. I am right in saying, am I not, that in the county of Gloucester there is a good deal of other fruit grown beside the apple?—Yes, there is a good deal of dessert and marketable fruit grown of various descriptions.

7871. In speaking of "orchard," you are rather confining yourself to the apple production for cider?—I am referring to both marketable fruit and the apple for cider.

7872. At the same time, there is a lot of other fruit grown in the forest?—In the forest there is a certain amount of bush fruit grown.

7873. Also plums and prunes, and so on?—Yes.

7874. There is a big fruit district in the North?—Yes, on the Worcestershire border there is a large amount of fruit grown.

7875. I would like you to give us your definition of "orchard"?—An orchard is an enclosure of standard

fruit trees attached to a farm with grass below. By the term "plantation" I refer to fruit trees with arable cultivation beneath, and in some cases bush fruit.

LORD BARNARD in the Chair.

7876. (*By Lord Barnard.*) You have not any class for forestry, have you?—We have not developed forestry at all, but if we had a permanent trial ground it would give us an opportunity of doing something in that direction.

7877. I see in the Board of Agriculture returns there is a large amount of forest land in Gloucestershire?—Yes, there is a large amount of woodland.

7878. There are 61,000 acres of forest, are there not?—The Vale is very well wooded, and there is the Forest of Dean of over 50,000 acres, but of course the Cotswold Hills are rather bare, except for beech trees and fir plantations.

7879. Is that all you have to say on the subject of permanent trial grounds?—Yes.

7880. The next item you have is about the development of continuous evening school classes in villages for labourers' and small farmers' sons, leading up to technical courses and classes in manual instruction suitable to the requirements of the district?—I want to draw a distinction there with regard to the educational requirements of the rising generation. The difference in the capacity between the farmer's son who has attended a secondary school and the labourer's son, or the small farmer's son who has come from an elementary school and perhaps been away from school for two, three, four, or more years before he thinks it is worth his while to take up evening classes is very great. You have got thus two different stamps of young men to deal with, and in any scheme you have to take that into consideration, and it is a very important point. Up to the present they have been rather classified together. That leads up to the question of continuous evening school classes. This is a point which Mr. Household will touch upon further after my evidence is finished. Our Agricultural Committee has taken the matter in hand and there is a scheme for two trial evening school courses, with the object of inducing a lad on leaving the elementary school to take out a course at once in the evening school, so that there will be no break in the continuity of the link. In that way you prepare their minds for any technical instruction you wish to give them afterwards.

7881. Do you really think you can do very much good in the educating of farmers' sons at these village classes in the evening. I can understand it in regard to labourers' sons, but I confess that I do not see that you can do much for the farmers' sons?—If you take a class such as we have had at Berkeley principally attended by farmers' sons the conditions then are different.

7882. You admitted that the circumstances at Berkeley are exceptional?—That leads to another question, namely, that to develop any of these things you must have local support—you must have somebody who is interested locally. I do not care what class of lectures you are taking up in this work, you must have a certain amount of local support. If the people are poking fun at the thing locally, it tends to destroy the interest.

7883. You want to go further than that—not merely to get people who will not poke fun at it or get people who only take a negative attitude—you want to get people who will take up a positive attitude with regard to it?—Yes, who will take a real interest in it.

7884. Yes.—That is what we have at Berkeley and at Laverton too; there are people at both these places who push the thing forward, people who have the interests of the rising generation at heart.

7885. Do you really think you can do anything for the farmer's son at these village classes in the evening?—We are trying it as an experiment at present, and I believe they will be found useful for the son of the smaller farmer.

7886. I think your experiment in this direction is rather weak, is it not?—Well, it is really branching out in a new direction.

7887. In other cases it is usually considered necessary to have a sort of farm school for farmers' sons, or to give them a course at a university college?—With our classes for young farmers and these evening-school courses we hope to work up to that in the future. In our present state of development we think that these village courses will lead in the right direction.

7888. Is that all you have to say on this subject?—Yes.

7889. I think we have covered the ground with regard to scholarships more than once?—Yes; Mr. Swanwick referred to it, and I also touched on it this morning.

7890. Then you have something to say as to the development in the future of a college for a group of counties. Looking at the map there, what is your idea on that subject? First let me ask you, again looking at the map, whether you are familiar, as I have no doubt you are, with all these agricultural institutions of different types?—Yes, I am familiar with most of them. I know Wye and Holmes Chapel, having been in close touch with them; also Cambridge and the college at Leeds.

7891. With the exception of voluntary institutions, there is nothing in the way of a public agricultural institution for the purposes of agricultural education in your county and those adjoining?—No, not in any way in touch with the farmers.

7892. You think you should have some such institution in Gloucestershire?—I think our system of agricultural education should lead up to that, and that we ought to have an eye to the establishment of such an institution during the next few years.

7893. Having regard to the number of institutions of this character which already exist, do you not think it would be a good plan to give a scholarship to likely boys which would cover their travelling and other fees, and enable them to go to these existing institutions?—That is what we are doing at present and it covers our immediate requirements. I have a scheme, however, set out in this paper before me—a scheme for the development in the future of a college for a group of counties.

7894. You know something about Bristol College, I daresay?—Yes.

7895. You know the position of Bristol College, and that they are contemplating extending their operations by means of a charter, or in some such way?—So I have heard.

7896. We understood from the witness who came here that it is more a college for the City of Bristol than anything else?—Yes; it has been developed up to the present more on those lines.

7897. I think he said they did not contemplate the development of actual agricultural teaching, but that it would be more in the way of research work?—Yes, so I understand, that it will be more in the nature of higher research work, like they contemplate doing at Birmingham.

7898. So that Bristol College would not serve the purpose you have in view?—Upon the present suggestions, it would not serve the need of a farm school or be in any way a practical school for farmers' sons.

7899. You are in favour of the formation of agricultural clubs for village lads?—Yes.

7900. Will you tell us what that refers to?—In connection with the evening classes to arouse the interest of the boys in rural subjects who are leaving the elementary schools by getting them to form small agricultural clubs. We have not done anything of the sort up to the present, but I think something in that direction might very usefully be developed so as to enlist their sympathy in these matters.

7901. Do you think you could sustain their interest when you had got it?—That would depend largely upon your schoolmaster, and upon the local support and local interest.

7902. Things are very different in Gloucester from what they are in the county of Durham, if you could maintain their interest in any organised institution of that character for any length of time?—Of course it would be a small thing to start with. As I say, it depends principally upon how much the schoolmaster is interested in the subject of nature study, and where the schoolmaster is interested in it I think it would be possible to develop something of a useful character, it would be more a local thing than a county thing.

7903. Your last suggestion as to how your present scheme might be developed and improved is by an annual grant from the Board of Agriculture, and by inspection by experts and assistance by advice. Perhaps you had better develop that yourself—I do not quite understand the meaning of it?—Of course the drawback at the present time to providing a permanent school or anything of the kind is the lack of funds. That is a matter that was touched on this morning. If anything is to be further developed, it is necessary that a grant should come from somewhere, and if certain sums from the Treasury were

*Mr. D.
Turner.*

12 June, 1907

Mr. D.
Turner.

12 June, 1907

earmarked for this purpose we might get a grant through the Board of Agriculture, and in that case the work, I take it, would be supervised by their inspectors, who would come down and advise us as far as the agricultural work is concerned. We have been subject to their visits in the past, and the advice we have received I have found personally to be very helpful. The inspectors see the work that is carried out in other counties, and they are able sometimes to give one useful suggestions.

7904. Do you really mean, if you could start an institution of the kind you mentioned, you would apply to the Board of Agriculture to put it on the list of institutions which they already aid, or that you would like some grant without such an institution, to develop the work you are carrying on?—The grant we ask for is to help to develop and improve the work we are now carrying on; I do not see how we can do it without it in the future if our work is to be extended in the right directions.

7905. Do you happen to know by chance as to the history of the grant which was made by the Government a few years ago for assistance in instruction in forestry and the result of the report of the Departmental Committee which inquired into that subject?—No, I cannot say that I do; I do not know the whole history of that.

7906. Not the whole history, but you are aware, I suppose, that it is a small grant, only £500 a year the total sum, and of the very great difficulty there was in getting it. I do not know whether you realise that getting grants from Government, and particularly substantial grants, is a very difficult matter, and that in order to justify such a grant you have to make out a very very strong case, and I would ask you what is the special case you would put forward on behalf of Gloucestershire in asking for such a grant?—That we are at present greatly in need of funds to help us to form some central institution by means of which we may develop our work to the best advantage on the lines we are now proceeding. Another point in which we are very greatly handicapped is with regard to our limited staff. As I mentioned this morning, I am not only organising the work, but I am engaged in teaching the agriculture, and one man to do all that work for a county cannot develop it very far or very quickly.

7907. What I mean is, you would have to make out a case and have to show that things are positively suffering from the want of this money, not from a purely theoretical point of view but from a practical agricultural point of view. It is very easy to ask for grants, but the Government will never entertain it unless a very strong case is made out?—Of course one could put the thing into a different form and show how it is utterly impossible to link up the various forms of rural education in Gloucestershire, and to train the rising generation so as to develop the agricultural resources of the county to their fullest extent unless we obtain fuller financial aid from some source. We have only £1,500 a year at present for Agriculture, and with that we could not develop that work at all on the line I have suggested.

7908. The scholarships are given by the county independent of the grant that is given for higher education, surely?—Yes, a certain sum is now raised locally out of the rates for the purpose.

7909. Does the County Council of Gloucester afford a boy who wants to get higher agricultural instruction any facility for doing so?—At the present time they afford him the facility of evening classes, and from those, if he is sufficiently intelligent, he can go on to any of the agricultural schools. There are two scholarships of £50 a year, and we have two students at present taking out their courses at Reading.

7910. Supposing you happened to have three, the third boy would be debarred because there are no facilities for more than two?—We have applied to the Board of Education to supplement the grant for the scholarships on the ground of their offer of local science and art exhibitions, and they have satisfied us that they will, so that we hope to grant four scholarships for that purpose in the near future.

7911. The county do not give you facilities?—No.

7912. They give some higher education scholarships. I suppose?—Yes—the details of which I cannot tell you.

7913. I suppose those would not be closed to agriculturists?—It all depends, the majority of them would be of little use to agriculturists.

7914. You have some experience of Cheshire, as you have told us. Do you think the facilities in Gloucestershire are equal to what they are in Cheshire?—As a matter of fact, there is a larger proportion of the

population engaged in agriculture in Gloucestershire than in Cheshire, but in Cheshire they have been brought more into touch with the business habits of manufacturing districts; and they are consequently more advanced in their ideas.

7915. You have not exactly answered my question. You say there is a larger proportion of agriculturists, but you have not told me whether there are equal facilities in Gloucestershire to what there are in Cheshire?—No, the facilities are not the same in Gloucestershire. What the Cheshire Council have already done for their rising agricultural generation is to provide a school at Holmes Chapel for lads, and a dairy school at Worleston for girls, and at present we have not got the same facilities, but we hope to develop them.

7916. You have no properly equipped centre, as you have already explained, and you have also told us that you have not a sufficient staff?—No.

7917. You have told us further, of the insufficiency of your funds. I do not think anything further arises?—No.

7918. (*By Lord Moreton.*) Some members of the Committee do not perhaps know the county of Gloucester as well as you and I do. May I ask your opinion, therefore, as to whether it is not an exceptionally difficult county to work on account of its geographical sub-division. It is practically divided into vale and forest and hill. Does not that add a great deal to the variety of the work and to the difficulty of the work?—It certainly makes a difficulty because the farmers who live on the Hills are quite distinct from those who live in the Vale, and the land and the methods of farming are quite different. The big farmer on the Hills is a different type of man to his neighbour in the Vale, and in the Forest you have a different class of population again; there are three distinct types of population.

7919. And two distinct types of farmer?—Two distinct types of farmer. That was really the point in my suggestion with regard to having trial grounds at different centres, so that you could deal with the farming that was typical of each district.

7920. Would you tell me why the numbers who attended the lectures at Berkeley are apparently so very much larger than those who attended the lectures at Charfield. I know both localities exceedingly well?—At Berkeley, we are working in conjunction with the Berkeley Hunt Agricultural Society. It is supported, therefore, by a strong local organisation; there is further the inducement of Lord Fitzhardinge's prize in connection with their Hunt Show, and also Mr. Peter Lord Fitzhardinge's agent, takes a great personal interest in the class, and encourages the young men to attend.

7921. With regard to the classes at Laverton, are they on the same lines more or less as those at Berkeley?—Yes, they are more or less on the same lines. At Laverton there are several young labourers as well as young farmers.

7922. Is that why you lay yourself out to catch the young labourer at Laverton more than you do in the Vale, or is there some other reason?—There are several small farms round there for one thing, and also at Laverton the local interest draws them off one particular estate.

7923. Laverton is near Toddington, is it not?—Yes.

7924. Is it in the vale or on the hills?—It is just down at the foot of the hills between Toddington and Broadway.

7925. There you succeed in getting young labourers?—Yes; a mixture of young labourers and young farmers.

7926. You find the same course of lectures attract both?—Yes, although it has to be more of an elementary nature than the teaching at Berkeley; they are more advanced at Berkeley.

7927. What subjects do you have at Laverton?—We treat of manures, cultivations and crops, and the way I have been guided there in framing the course has been to follow up subjects of immediate local interest.

7928. I noticed when you were speaking just now about your suggestion of agricultural clubs for village lads, you rather suggested that it would be a case more for the village schoolmaster than anybody else. I am not quite certain that I heard you correctly, but I think I heard you say where the village schoolmaster was interested in nature study?—Yes: where he is interested in nature study and gardening and so forth.

7929. That means, to put it in other words, the village schoolmaster who is in sympathy with rural affairs?—With rural affairs and rural work generally.

7930. Rural work is rather a term that would tend to limit the thing?—Yes; it is rather an ambiguous term.

7931. (*By Mr. Lamont.*) I should like to ask you one or two questions about the dairy school at Gloucester. How many pupils have you there in these various classes?—I have the figures here. A certain number come to the central school and we have a great number outside. At the central school, in butter making, there were 25 pupils last year; for cheese making, 10 pupils. The same teacher also conducts classes out in the county and about 80 pupils received instruction in this way during the course of the year.

7932. Have you any cows of your own at this school?—No; all the milk is bought from a local dairy company, the quantity depending on the number of students who are at work at any given time.

7933. You order in advance the amount you will require on a given day?—Yes, as it is required. The instructress knows how many pupils are coming and she orders the quantity of milk that is required. Of course it is milk that comes from the farms round Gloucester, but we get it from the Dairy Supply Company, because we require it in such varying quantities.

7934. Do you give any instruction by way of inspection of the dairies from whence this milk comes?—No.

7935. You would admit, I suppose, that that is an important department of dairy work—the management of cows?—Certainly, from the point of view of hygiene.

7936. Yes, and the grooming and milking and other work in connection with the cows?—Yes, we depend, however, on the company to supply us with clean milk. Of course if anything is noticed wrong we lodge a complaint at once, but we do not go beyond the dairy company.

7937. You take up the work from the point when the milk is already provided from the cow, and the earlier part of the work, which at any rate in Denmark is thought to be so important, has so far not been taken in hand by you?—No. Not having a farm school we have not been able to go in for that part of the work. In Cheshire, at the Worleston Dairy Institute, we had a farm and cows and everything in the way of appliances, but we have not in Gloucestershire.

7938. Can you tell me whether at that school you spoke of in Cheshire there is anything done in the way of experiment and demonstration as to the result of feeding on the yield of milk, or as to the result of feeding on the percentage of butter fat contained in the milk?—When I was there they had not worked out any special results; I do not know if they have done anything since. It was more of a practical cheese school for teaching the girls the principles of cheese making.

7939. You would agree, I suppose, that an important advance is still possible in this country by way of teaching farmers to keep exact records of the amount of milk yielded by each cow in the dairy?—Yes, for anybody running a herd of cows that would be most useful information.

7940. And therefore only to breed from the cows which had a good record behind them?—Certainly.

7941. In Denmark, I daresay you are aware they have during the last 20 or 25 years brought up the average milk yield of cows throughout the whole of the country from about 500 gallons per head to over 700, and in one dairy that I am particularly acquainted with there, the average milk yield of the cows is 832 gallons. In another case it is over 900 and they have a very large number of cows. That has been simply done by keeping the milk records and making a selection of the cows and also by the adoption of the new method of milking so as to entirely exhaust the milk which is in the udder?—Yes.

7942. Are you aware whether that has been done in any dairy school in this country as yet?—I cannot say that I am aware of it having been carried out systematically.

7943. In Scotland I understand it is being carried out under the direction of Mr. John Spier, of Newton Farm, Glasgow, not in any school but on their own farms by an association of farmers?—Is that in connection with the Highland and Agricultural Society?

7944. No, it is a friendly organisation, but the Highland and Agricultural Society is watching their results very carefully, but I do not think it is associated with them in any closer way. I take it you would agree that the adoption of that system would be a valuable addition to the dairy school at Gloucester or any other dairy school in this

country?—Certainly, any work in that direction but, unfortunately, at the present time we have not got the funds to carry out such experiments.

7945. With regard to elementary school teachers, do you think it would be feasible to invite intending teachers on entering a training college to specify whether they prefer to take up as their life work teaching in a rural school or in an urban school?—Yes, I think it would be most advisable.

7946. And accordingly as they decide so their subsequent training might be differentiated?—Yes, modelled on those lines.

7947. Certain subjects would require to be eliminated or at any rate reduced in the time allocated to them and other subjects would require to be substituted, and in that way we might get by a system of natural selection the class of teachers in a rural elementary school who would perhaps be more in touch with rural things and more inclined to help onwards students who desired to take up agricultural life hereafter?—Just so.

7948. (*By Professor Middleton.*) You mentioned among your present needs in the county the provision of experimental fields?—Yes.

7949. Have you formed any estimate of the cost of furnishing such experimental fields as you have referred to?—I have not gone very fully into the details, as to the area we should require and so forth, but I have no doubt if we had certain funds that we could draw on we should get good local support in the matter.

7950. Lord Barnard indicated to you how necessary it was, if you were going to apply for Government aid, that you should make out a very strong case for it, and you mentioned the fact that these experimental stations were necessary, so that you should be able at any time to furnish particulars of the cost of setting up such stations?—I have not drawn out particulars for to-day because I did not think it was necessary to bring them with me, but at any time at short notice I could get full details and costs out.

7951. You indicated that one type of station which you required was an experimental grass station?—Yes.

7952. For what part of the county do you require that?—The Vale which is principally grass—permanent pasture.

7953. Have you any other type of experimental station that you require?—I should also like to see a demonstration orchard formed on the lines already mentioned. Perhaps we could spread the arable trials over different farms, but for pasture and fruit we want something permanent.

7954. Have you had any difficulty in getting land temporarily for experimental purposes in Gloucestershire?—Not at all; as a matter of fact, I have more land offered than I can really deal with owing to our limited staff.

7955. So that your real reason for asking for a permanent experimental station is that you would be better able to control the results than you can in a temporary one?—That is exactly the point.

7956. What type of scheme do you adopt in these experiments?—They are modelled as closely as possible on the lines of the scheme issued by the Board of Agriculture in 1903 adapting them to local circumstances.

7957. What particular type have you found most successful in Gloucestershire?—Manurial trials on swedes, which are the great crop on the hills, also on mangels, meadow hay, and permanent pasture.

7958. In your winter classes, which you mentioned, what subjects do you find most popular with the lads?—Manures, cultivations, feeding stuffs, anything that has a practical bearing on what they are doing on the farm.

7959. Subjects of which they can see the bearing on their farms at home?—Exactly.

7960. Have you tried in these winter classes at all to give instruction in the principles of elementary botany or anything of that description?—Not very thoroughly in the winter classes for young farmers. They are more of a practical nature. At Cirencester Grammar School I have been able to go into the sciences, but in the winter classes you want something of a more practical nature.

7961. You recognise the value of giving a science course, but in the winter classes you are of opinion that something of a practical nature is required?—Yes.

7962. You complained of the want of education of some of the lads who came to your winter classes?—Yes, dis-

Mr. D.
Turner.

12 June, 1907

Mr. D.
Turner.

12 June, 1907

location, if I might call it so, with their school work is what we principally complain of.

7963. How long have these lads left school before they come to you?—I have had many students from 16 to 25, so that the time since they left school varies considerably.

7964. At what age do you prefer them?—If I had my way I should like to take them as soon as they leave school and train them up, but I do not get the opportunity of doing that; I have to make the best of the material I get.

7965. These courses last for the one year I understand?—No, I have been going to Berkeley for three years.

7966. I was not thinking of Berkeley in particular?—And at Charfield I have had them for two years.

7967. Do the same men come back again for another course?—Yes, the same men come back again, but what I complain most particularly about is that the continuity is broken when I have to leave the district to go elsewhere, and for this reason I should like to see a permanent school established at Gloucester, or some other central place.

7968. The type of institution which you really want at the present time in the county is a winter school in Gloucester, or at some central place?—Yes.

7969. How would you compare such an institution as you suggest with an institution like the one at Holmes Chapel for instance. Would you have a more extensive curriculum, or would it be of a more elementary type?—It would be of a different type, but fully equipped with apparatus, and I should not expect the young farmers to come up more than two or three days a week. It would not be necessary for them to come into residence.

7970. You want them to come up for certain days in the week?—Yes, to take out classes. In this way the courses would be made continuous and more complete, such subjects as agricultural chemistry and botany, practical agriculture, dairying, and fruit growing would be taken.

7971. It would be something different in type from the institution at Holmes Chapel?—Yes, it would not be a complete agricultural course.

7972. (*By Mr. Latham.*) Coming from Cheshire as you apparently have done you find Gloucestershire in a much worse position because it has no centre?—Yes, owing to its having no centre.

7973. Do you think that is the real cause of it?—That is one of the reasons. Of course things generally have not been developed so fully, as far as education is concerned, as in Cheshire.

7974. Has the fact that there is no centre been a reason in all probability why little interest has been shewn?—Partly, unless you call the dairy school a centre. That is the only institution we have approaching the dignity of a centre. I certainly think if a centre was developed it would accelerate things and stimulate an interest.

7975. With regard to your dairy school I was much struck with the numbers you gave us just now. You said you had 25 in one year for butter making. Surely that did not include the total teaching in butter-making during the year?—No; that only includes those who came up to the central school. The instructress also goes out into the county and is only at the central school on certain days.

7976. How often is it open?—The greater portion of the year; but most of the pupils come in the spring and summer. A great many of the butter classes are held in the villages.

7977. And ten pupils you said for cheese-making?—Yes, at the central school.

7978. I suppose the cheese making is rather a small industry in your county?—There is not so much cheese made now as there used to be.

7979. Can you tell us what is the reason for that?—The price of cheese during the last few years is one reason.

7980. It is very high, is it not?—It is a better price now and we have consequently had several pupils taking out classes in cheese making this summer. Another reason for the falling off in the manufacture was that farmers found there was less work at home and more profit in selling their milk instead of making it into cheese.

7981. Do you do anything to test the milk when it comes into the dairy institute?—You mean each morning and evening?

7982. Yes?—It is not tested each morning and evening,

but tests are taken from time to time. We also have a system of testing milk for the farmers.

7983. On what lines?—Testing for the percentage of butter fat, and we also calculate the percentage of solids by the scale.

7984. If you have no place to do it, where is that done?—We test it by the Gerber milk-tester in the dairy school.

7985. Do you send it to the farmers or do the farmers come and see it tested?—We send the results to the farmer. It is a scheme brought forward by the Board of Agriculture. We have issued a leaflet offering to test the milk for percentage of butter fat so as to let anyone know who is interested how the quality of their milk fluctuates.

7986. Have you done anything which is as satisfactory as the results shown on those cards of the British Dairy Institute (*Handing cards*) where there is not a point difference in a week?—No, we have not got out anything of this style. We have a record of the samples which have been tested during the various months for the last seven years.

7987. When you find that the register proves very irregular, have you taken any means of assisting the farmer in remedying the difficulty?—Yes, we generally ask them to state their method of feeding and management, and then, if there is anything very peculiar about the sample, we make any observation that is necessary.

7988. I daresay you are perfectly aware that feeding has very little to do with it?—Yes, from my own experience I have found that feeding by no means entirely controls the quality of the milk.

7989. What is your remedy for very bad records of milk?—If you are going to start a discussion with regard to the factors which control the quality of the milk it will take some time. Personally, I think the individual capacity of the cow has a lot to do with it.

7990. Do you not think that the regularity of milking and the way in which the milk is extracted from the udder has more to do with it than anything else?—They are certainly important factors, of course there is a great variation in the quality of the milk between the morning and the evening as we have found with the samples at our dairy school at Gloucester. I have just been drawing out a chart showing the results of the tests we have made there for the last seven years. I am drawing it out for our county agricultural show, as we have a nature study exhibit there, which includes a stand from the County Agricultural Department. There is a variation of nearly 1 per cent. between the morning and the evening milk taking the average throughout the different months for the seven years.

7991. Do not you think the regularity of the 12 hours has a great deal to do with the flow of milk?—Yes, certainly, the time between the periods of milking has an important effect both upon the quantity and quality of the milk.

7992. How far does your milk come to the dairy?—As I have already said, we get it from the Dairy Company; it comes from the farmers in the vicinity of Gloucester. It may come a matter of 3 to 10 miles.

7993. Why I ask the question was because Mr. Lamont asked you whether you were aware of the different methods existing in Denmark for carrying out this scientific instruction. Is there anything to prevent pupils from going to the farmers who supply you with milk and getting as much education on the farms there as though you had got your own cows and your own farm?—I am afraid some of the farmers would rather resent such visits. They would think we were in some way trying to supervise their methods.

7994. Even if you take their milk?—You see, we do not take it direct from the farm. We buy it from the Dairy Company.

7995. That is so, but probably the visits of the pupils would do them as much good as it would do the pupils?—If one could get friendly access to the farms it would be a benefit.

7996. My experience is that the dairy farmer has been more willing to be educated than any other class of man?—Well, to a certain extent.

7997. To a general extent. You have told us you have £1,500. I presume that is from the county. Is that allocated in special grants to different educational objects?—The Education Committee pay over the sum of £1,500 out of the Residue Grant to the Agricultural Sub-Committee for the purposes of Agricultural Education.

Mr. D.
Turner.

12 June, 1907

7998. Without any of it being earmarked or anything of that sort?—There is £100 earmarked for the Cider Institute at Long Ashton; we are a contributing county.

7999. You made the remark that you were so anxious to get land set apart for fruit culture and grass experiments. Do not you think it would be much better to go a little further and try and get a piece of land set out for the whole thing, partly for grass, partly for agriculture, and partly for fruit?—That would be an experimental farm.

8000. It seems to me that it is only begging the question to only deal with a portion?—It would be better, of course, provided we could get the funds for it. We are very much handicapped for want of funds at present.

8001. With regard to elementary schools, do you think it is possible you will get the young farmers and the labourers to meet and receive education at the same time in the evening?—You would get the sons of the smaller farmers to receive education at the same time as the labourer.

8002. That means virtually labourers that are farmers I suppose?—Yes; with a special view to the requirements of the young labourer, however, we are developing the two trial evening school courses that I have already mentioned, working on very practical lines.

8003. Where are those evening schools to be held?—One at Cam and one at Almondsbury. They are two trial courses specially adapted to the wants of the labourer and small farmer.

8004. Those two are very small places?—Yes, but we selected them as being typical agricultural centres; they are both in the Vale.

8005. If you could get this farm for both agriculture and horticulture and anything you might require, do not you think the local support would be very much more given to such a centre. Reading College, for instance, is covering a large part of the country and our kind friends are giving us a very large sum of money to support it. It is supported very much by the aristocracy and the county people of the district. Do not you think, if you could get such an institution in Gloucestershire, it would be very much better than having all these small centres?—Yes, but the difficulty is to get the capital for the initial start.

8006. I quite agree. It would be a very valuable thing for the county of Gloucestershire if something of the sort could be arranged?—Quite so, provided a workable scheme could be developed.

8007. What do you call workable. Is not there an opening for such a thing?—In the future I think there will be.

8008. Going back to the higher sphere of agricultural education, do you think that your farmers in Gloucestershire are receiving as much education as is beneficial to them for their good?—They are receiving as much as our income will afford.

8009. I do not want that answer. I want to know whether you think if you were able to do more you could find room for more?—Yes, provided we can develop on the lines I have sketched out here.

8010. I will put it to you in another way. Do you feel that the county of Gloucester is so very far behind that they would not take advantage of this education if it was offered to them?—I will not say as much as that, but I consider that the people want educating up to take advantage of what is being offered them: I do not think you could rush the thing. I think they want leading up to it, and that is what we have been doing during the last three years.

8011. Do you think the surrounding counties would come to you if you had such a central institution in your county?—That is rather an open question at the present time; we might get one or more of the neighbouring counties to join with us, but I cannot say offhand how that would be.

8012. With regard to these agricultural clubs for the village boys, have you tried it or is it simply a suggestion of yours?—It is partly a suggestion and partly what I have seen. For instance, some of the schoolmasters at the present time have got the lads interested in agriculture and rural pursuits in one or two of the schools, and from what I have seen here and in Cheshire I certainly think the idea might be developed.

8013. Would you just give us a very small instance of how you would develop such a thing?—On the boys leaving the elementary school to get them sufficiently interested to join an evening school class, and in connection

with that to form a small agricultural club where they could have meetings periodically and where they could bring specimens of things of interest in their everyday work and discuss them—specimens of insects and plant diseases and so forth, it would be very valuable.

8014. Would it be of any value if those sort of things could be joined to the village flower shows, for example, which often create very great interest in the villages?—Where they have got a horticultural society it might be possible to link it on to that.

8015. Do you not think it would be rather more likely to succeed on such lines?—Yes. I know one instance where the schoolmaster is the secretary of the local horticultural society, and it might be linked on in that and similar cases.

8016. The schoolmaster generally is the secretary of the local horticultural society, and if you could link it on to those you would then have the whole village with you instead of having only these small village clubs?—Yes, it would be better to link it on in that way just as at Berkeley the young farmers' class is conducted under the auspices of the Berkeley Hunt Agricultural Society.

8017. There was some remark made just now with regard to the training of elementary teachers to take up rural work, and the training of teachers to take up urban work, but do you not think that the urban man has very much that is in unison with his rural brother—for instance, in my own part of the country we have a very large exodus from the town whenever we want labourers for harvest work, potato-picking, pea-picking, and all that sort of thing?—Yes, but that is just during harvest time.

8018. Our great complaint is that these men come to us great dunces with regard to agriculture, and do not know, many of them, the difference between a swede and a turnip or a potato and a turnip?—Of course they are not much good, many of them, and you would hardly expect them to be, except for putting on to hop-picking and that sort of thing.

8019. Could not they learn a good deal in the towns with regard to agriculture? Do you not think there are as many allotment holders in the towns as there are in the country?—There are a great many of such allotment holders in most of the towns of Gloucestershire.

8020. The largest number of allotment holders that I know of is in the city of Oxford, and I cannot help thinking that if the schoolmaster in the towns could be taught something, so that he would be able to give instruction in gardening; for instance, there, it would be of quite as great an advantage as it would be in the rural districts?—Some of these rural subjects, I consider, are quite as educational for the town teacher, as I have already mentioned, as other subjects. They develop his powers of observation for one thing.

8021. I am myself so very much against having two distinct persons—one specially trained for rural teaching and one specially trained for urban teaching?—I certainly think they should take out some rural subjects in common, such as gardening and “constructive carpentry,” but whether the town man should take a rural course as well as his ordinary course is another question, and one that I am not prepared to answer, but I certainly think, as far as the rural man is concerned, he requires a special course to suit him for his vocation.

8022. Have you done anything in the way of experiments with potatoes?—Yes, we have had some trials with Scotch seed as against English seed, and this year we have also started manurial trials with potatoes at four centres in the county.

8023. I suppose it is fair to ask you whether the results of your trials have been published?—Yes, I have some of our published trials here—the ones that we carried out last year (*Handing in books*).

8024. (*By Mr. Davies.*) I suppose in Gloucestershire you come across agricultural problems which you did not meet with in Cheshire, the conditions not being similar?—Yes, that is so.

8025. Have you any provision for any kind of research work at all? Does the County Council provide you with any apparatus for carrying on research in any way?—No, I am afraid not, unless you call some of this experimental and demonstration work research, and you can hardly call that research. But beyond that we have no apparatus to carry on the research work, not even a microscope, the want of which I felt very much the other day when we were looking for American Gooseberry Mildew.

8026. You have not any college with which you are

Mr. D.
Turner.

12 June, 1907

linked up which could assist you in enquiring into these problems?—No, we are linked up to no college whatever.

8027. I see you say in your *précis* that the development in the future of a college for a group of counties is desirable. Have any negotiations taken place with the adjoining counties with a view of starting an institution of this kind?—So far as my Committee is concerned nothing has been done up to the present time.

8028. I take it that is the line on which you would like to see it developed?—It would certainly assist the work if we were linked on to some institution where we could get expert advice when necessary.

8029. Has your Committee considered that it might possibly be linked on to the University College at Bristol for example?—No, nothing has been discussed by my Committee at present, although some such steps might be taken with advantage.

8030. Have you made any provision for agricultural laboratories?—No, that is one thing we might develop with the winter school. I did not draw special attention to it, but that is a thing which has been in my mind for some time. We have no laboratory at present where we can give instruction or where the staff can carry out any research work. In connection with this winter school, a county laboratory for the purposes mentioned would be one of the most useful additions we could make.

8031. Are there any laboratories existing at present which might serve as a basis?—There is none in the county that I know of.

8032. (*By Mr. Medd.*) I think the amount allocated to agriculture in your county is something like £1,500, is it not?—It is.

8033. That is somewhere about three times as much as they have in Berkshire—probably you do not know how much they have in Berkshire?—No.

8034. It is about three times what they have in Berkshire. How many scholarships have you?—Two at present.

8035. They are both at Reading?—Yes. They are advertised to be tenable at any agricultural school or college agreed to by the Committee.

8036. You are receiving excellent accounts from Reading with regard to those scholarship students?—Yes, the report on the work of the students is very good indeed.

8037. The Reading witnesses who were here the other day spoke in the very highest terms of the two students from Gloucestershire. You mention here about the development of a college for a group of counties. Have you formed any idea yet as to what group it should be?—No, I have not gone into the matter. I simply mention it with the idea that if anything is done in the future it would be best, considering our financial position, to join in with a number of counties. We have no such institution in the west.

8038. As you see on the map there it is all white, and they might be grouped as they are in other parts of England?—Yes. If we were to take Gloucester indi-

vidually, one man would say it ought to be modelled on the hill system, and another man would say it ought to be modelled on the vale system, and that would not occur if the counties were grouped.

8039. You mention here the formation of a winter school. Have you formed any idea as to what the winter school should be—how long should it be open?—For teaching purposes during the winter six months, and as a bureau of information during the whole year.

8040. Has anyone expressed his readiness to support a winter school?—I have talked it over with one or two of the farmers who have sons, and they would be willing to send their sons.

8041. Where do you think of having it?—I should suggest at Gloucester, because that is the most accessible spot for the whole county.

8042. Can you give us an idea as to the general work that is done at Berkeley?—The course of work we take out in the winter class?

8043. Yes.—The syllabus followed in the evening class includes the following subjects:—Soils, manures and feeding stuffs, estimating values from analyses, live stock, their points and management; practical demonstrations are given, including judging the live and dead weight and value of cattle, sheep, and pigs; feeding experiments have also been conducted to determine the live weight increase and return from various rations.

8044. Is there any instruction in machinery?—Yes, we have just started classes in "the care of farm machinery."

8045. With the machinery instruction are any lessons given in simple mechanics?—Not up to the present. So far the work has been of a practical nature, in which a machinist makes the young men take various farm machines to pieces and put them together again, at the same time shewing them how to effect small repairs in the field.

8046. That is a very successful class, is it not?—Yes. We had a class of that kind at Chipping Campden, and it was very much appreciated by the farmers in the neighbourhood.

8047. You mentioned the formation of agricultural clubs for village lads. What is that?—It was a suggestion on my part that in places where there is sufficient local support, the village schoolmaster, or some other person interested, should form a club to interest the lads after they leave school in agricultural subjects, and where the circumstances are favourable should connect it with a school garden.

8048. Something like the agricultural clubs they have in America?—Yes, on somewhat the same lines.

8049. (*By Mr. Davies.*) Do you charge the students who attend your night classes any fee?—We charge them a small fee just to cover local expenses.

8050. Do you find the classes are attended in good numbers?—Yes, taking them altogether they have been very well attended.

(Lord REAY in the Chair.)

Mr. H. W. HOUSEHOLD, M.A., called and examined.

Mr. H. W.
Household.

8051. (*By the Chairman.*) You are the Secretary to the Gloucestershire Education Committee?—Yes.

8052. I think you are prepared to give the Committee some evidence with regard to the obstacles to the development of agricultural education?—Yes. The first is the financial obstacle. That has been dealt with by all the witnesses this morning. I do not think that we are likely to be able to do any more for agriculture unless we get some help from outside. There are so many calls upon the "whisky money" for other branches of education that I am afraid, even although there were any increase in the "whisky money," it would be absorbed before it came to agriculture, and that is why I think that any money that came from any source for agricultural education ought to be ear-marked. I think nothing can be done unless there is some ear-marked grant, and I also think that you will not get any great support locally for agricultural education unless it is elicited by an offer of a grant either from the Board of Education or from the Board of Agriculture in support of that teaching.

8053. You would require local grants proportionate to grants from the Board of Education or the Board of Agriculture?—Yes, such a condition might elicit help from the rates. At present we have no proper scholarship scheme in Gloucester; we have had to drop it for want of funds. A general scheme of scholarships to produce elementary teachers would cost us quite £2,000 a year, so that a grant of £2,000 not ear-marked would be absorbed in those scholarships at once, and none of it would reach agriculture.

8054. Any general fund that came in would have to go to these other scholarships?—Yes.

8055. Of course that would not apply to any grant you might get from the Board of Agriculture?—No.

8056. Then your next head is that there is no institution for agricultural instruction in Gloucestershire?—No central institution. When an instructor goes to one village one year and another village another year there is no lasting effect. He has only six evenings in the week at his dis-

Mr. H. W.
Household.
12 June, 1907

posals, and there is only a small part of the year in which the work can be done, and if it lasts anywhere as long as it does at Berkeley he has to neglect other districts because he cannot cut himself up into different pieces, and unless there is some sort of central institution established I do not think there will be any continuity in the work.

8057. You think the agricultural lectures ought to have a definite aim?—Yes, I think from the bottom, the elementary school, upwards there ought to be a definite aim; there is no linking of the thing up at present.

8058. The lectures given to farmers who are of a certain age can only, of course, have for their object aid to the farmer in the industry?—Yes.

8059. You contemplate two kinds of lectures, I suppose?—I am not thinking about the farmer at the moment. I know nothing about that side of the work, but I think you will not get any very great results until you have got the elementary school child to pass on to the evening class directly he leaves school, and prepare him to receive technical instruction in such a way that the time of the technical instructor in agriculture or whatever it may be shall not be wasted in teaching the pupil elementary details over again.

8060. You are of opinion that there should be proper grading?—I am not quite sure that I follow what you mean.

8061. Proper grading means from the elementary school to a secondary or agricultural school, and from that school to a college. I understand that is what you were suggesting?—Yes. That is what I mean.

8062. That is what has been called "grading"?—There would be several avenues from the elementary school. Some would want to go to the secondary school, and some would go from the elementary school to evening schools in touch with agricultural schools perhaps, and then on to the college.

8063. As we are on the subject of grading, you mention that the organisation of different branches of education should be "vertical and not horizontal." What is the horizontal organisation?—The boy's education at the elementary school stops when he is 13, and a certain set of people think only of what he has to do up to the time he is 13, and not of what is to follow beyond that age. They are not preparing him for what is to follow, unless, perhaps, he is to go to a secondary school. Any scheme of education ought to be looked upon as a whole, and the elementary school ought to be taught and inspected and organised by people who have got a complete scheme of education in their heads, and not only a part of one. The elementary inspector and the elementary teacher have very little knowledge of what the boy is going to do afterwards, and very few of them care about it. The elementary inspector, if you asked him what better the boy would be in three or four years' time, would say: "That is not my business," and it is not, but it ought to be somebody's business to look to the thing.

8064. Are you advocating that there should be the same set of inspectors for elementary schools and technical schools?—Partly. I would like to see one man responsible for the whole work to the counties. The counties have the scheme of education as a whole before them now, and they try to link up the whole thing, but they deal with inspectors who only have parts before them of the scheme of education, and there is nobody on the spot to link up the whole thing, and you may have inspectors from different branches making contradictory recommendations. For instance, the most valuable suggestions I get come from the technical branch of the Board of Education; in many cases they are most admirable suggestions, but if you try to put them into practice you find yourself fettered by the want of sympathy on the part of the elementary inspector, or by the rigidity of the code. For my part, I should like to have central schools, which should be better than other schools, where you could give a more efficient practical instruction, and I would like, on the top of those schools, to see something of the character of a polytechnic—we have got one of them, and I hope we shall have more—and then the boy would see before him from the time he entered the school, a complete course, and would understand more or less the value of the lessons he was receiving in the day or the evening school. I say he does not at present, and that part of the work is of a wholly unpractical character. He is taught to read, but not to read a book, and he is taught to do sums, but not to apply his arithmetic; and he is taught to satisfy the inspector when the examination comes round, and in two or three years' time he has practically forgotten it all, and therefore it is wasted. We have one school in Gloucestershire in connection with an old polytechnic, and

in that school the boys spend half their time in wood and ironwork and designing in connection with it, and the literary part of the work is cut down a great deal; there is not nearly so much history or geography; grammar is cut out altogether and arithmetic is directed to the problems that the boys have to work out. They have a certain amount of instruction in modern topics, what is going on is talked about, and the materials they deal with are talked about, and a good deal of geography is got in that way. We find the result of that is that the boys are very keenly interested, and employers are quite willing to take them, because they find they are handy boys and have got their wits about them. But the best test of the efficiency of a school like that is that the boys stop longer. They used to leave school at 13, but now they show an inclination to stop till they are 14 and, further, those boys come back voluntarily to night school, and many employers make it a condition when they take them on that they shall continue to attend the night school. If you give them some practical instruction of which they can understand the value and which will have some relation to the work they will do in after life and will tend to make them skilled, they are willing to have instruction. A polytechnic could be built up on those lines either of a town or a rural character, or, in fact, of any character suited to the needs of the district.

8065. Where is that school to which you refer?—It is at Brimscombe, near Stroud.

8066. Does it earn a grant?—Yes, as an experiment the Board of Education have allowed it to be conducted as a public elementary school, and they are paying them the elementary school grant.

8067. Although it does not fulfil all the requirements of the code?—I suppose it does not exactly fulfil them, although I do not think you could say it broke any rule of the code. In one respect it runs outside the usual limits; the head master is not a certificated teacher at all. He is the head of the Polytechnic, an art master with considerable craft experience, and the Board of Education have allowed him as an experiment to be recognised as the head of that school. That is the line, in my opinion, that is wanted in both teaching and inspection; in the elementary school you want a man who knows something of the work above, men who have a comprehensive view of the whole scheme. Take the public school system: everyone will admit it would be ridiculous to put in a preparatory school a man who knew nothing about either public school or university. It would not work. You want a similar system in public education, and if the higher education is going to take a technical line, you want something in the elementary school definitely leading up to that technical line. I do not mean that the boys are to be less educated or worse educated in a literary manner than they are now. I think they would really be better educated, because they would be better able, if this system were adopted, to understand, retain and apply what they learn. The technical instructor is quite as keenly interested in the efficiency of the general education as the elementary man is, because he it is who finds out the weakness of the pupils who come to him, and knows where the thing breaks down for want of previous preparation. Sometimes people think, if you are pleading for instruction of a more technical and practical character, you are neglecting the literary education; but you are not, because, at this Brimscombe school that I spoke of, the boys do better work in the literary subjects although they give less time to them, and the same with the girls who do domestic science. They give 10 or 12 hours a week to domestic science and less time to the other subjects, but they actually do better in them. The thing is to try and make children think a little more for themselves and pour a little less information into them.

8068. The school you have been speaking of is for town boys more, is it not?—It is in a manufacturing district, but it is really a village; there are not more than 2,000 people altogether, and boys come from all the surrounding villages to it.

8069. It is a school for artisans chiefly; it is not a school with a view to giving farming instruction. A polytechnic is for artisans primarily?—It is.

8070. Therefore the main object of a polytechnic of this description linked to a school is for industrial development principally?—Yes, but we propose to do something in that way for agriculture.

8071. I quite understand. You think the same principle that applies to the polytechnic and the school which is linked with it for industrial development should apply to the rural school, and that the rural school should be linked up

Mr. H. W.
Household.
12 June, 1907

with a polytechnic for the purpose of agricultural development?—Exactly, and I would like to have at the head a man who had done agricultural teaching himself. The head of the polytechnic should see that the whole scheme of work from the time that the child came to the elementary school was one directed to the development of agricultural education.

8072. You propose that the teacher in the higher school to which you want to send them should have or take part in the direction or management of the inferior school?—I do.

8073. That is your view?—Yes, and I should like to see the same view taken by the inspecting bodies whoever they are.

8074. You want the elementary and evening schools made more attractive?—I do not want any sort of recreative classes.

8075. I do not say that; I mean you want the instruction to be given in such a way as will attract the pupils?—Yes, the instruction in the evening school fails in just the same way as in the elementary schools, because teachers are giving wrong instruction in a wrong method. What is bad in the elementary school is really worse in the evening schools. The work at Almondsbury and Cam that Mr. Turner spoke of promises to be interesting. It is based on the very valuable Memorandum issued by the Board of Education on "Courses of Work in Rural Evening Schools," and the foundation will be laid in the elementary school. If the Brimscombe experiment is approved by the Board of Education, we shall introduce gardening and carpentry and rural experiments, and the boy who has been through that course until he is 13 or 14 will pass on to the evening school at once when he leaves the elementary school. The schoolmasters at Cam and Almondsbury are trying to make their school work lead up to Mr. Turner's classes. The only reason why it is done on a small scale at present is that we have no money; but if these things succeed, in three or four years' time we shall have a great many of these schools no doubt. For my own part I would reduce the expenditure on the elementary schools for that purpose. I think the requirements at present made by the Board of Education are unwise; I mean I would not spend so much upon furniture, and altering buildings and that sort of thing for the present; we want the money for teaching, and many schools, I am sure, are quite good enough as they are, and if only one could get the teaching done properly, one should be satisfied. I would like to take money away which I think is wasted in that direction and give it to higher education, and until something is given compulsorily for higher education, I think it is useless squandering money on what is really unnecessary. Half the work that is done in the elementary school is entirely thrown away because it is never carried further; the boys merely become unskilled labourers; they become weight lifters; they have no skill, and they are none the better for what they have done at school.

8076. You suggest that the elementary school should be brought also into greater harmony with the evening classes?—Yes.

8077. The elementary school should lead up to the evening classes that are taken by Mr. Turner?—Yes, and then from these evening classes the boys would drift into the polytechnic. If you had these polytechnics dotted about, six or eight of them, in the county you might have some reason then for going on to a central institution, an agricultural college worked by a group of counties, but I should begin organising from the bottom until we get the demand for the thing. It is no good starting from the college first.

8078. Would the pupils at the evening classes afterwards go to what we have called a winter school?—I imagine some of them would if there were a winter school within reach.

8079. Some would go to the winter school and others would go to college?—A very small number would go to college, of course, only the pick.

8080. You are of opinion in order that the college work may be made more efficient that the students should have been at some secondary school?—Yes. I do not think the pupils who have only gone through evening classes, except in very, very rare cases, will go to college.

8081. I want to know how you apply your theory to secondary schools preparatory for the college. Most of the evidence we have received is in favour of the ordinary general secondary education being the right sort of preparation for the college. Are you of opinion that the secondary schools for agricultural students at agricultural colleges should be

differentiated from the ordinary secondary school which leads up to the university?—I am not sure that I have had enough experience to give a valuable opinion. I think in all those schools you want much more practical work than you have. I think much of the teaching is far too abstract at a secondary school. When I was taught I consider my own teaching to have been much too abstract and for that reason I never understood at school a great many of the subjects which I might have understood, and I learned things by heart which might have got to my intelligence. Everything that can be taught in a practical manner I would have taught in a practical manner, and in a secondary school in an agricultural district I do not see why the practical teaching should not take an agricultural character. I should make it. For instance, what is called nature study, a lot of it is nonsense at present. The nature study in a secondary school in the country should have something to do with farming and rural life generally. It is usually made botany, probably taught from a textbook to children who have never used their eyes. That is not nature study and it ought not to be done like that. I would give everything the utmost amount of practical bearing that can be given to it, and a lot can be given to it. For instance, Mr. Turner's teaching at Cirencester appears to be a success. The headmaster likes it. It appears to be nature study, but it is really a practical agricultural study taught to farmers' sons.

8082. Your idea is that a general reform in the methods of teaching is necessary both as regards elementary and secondary schools?—Yes.

8083. You mention the analogy of the public school and university system or of institutions like the Merchants Venturers College at Bristol?—Yes. The Merchant Venturers Technical College has a technical college at the top, a secondary school below it and a preparatory school below that. They found it necessary before the Act of 1902, and before education was better organised, to prepare the boys through every grade of their education.

8084. Therefore what you consider advisable is illustrated by that institution at Bristol?—Yes, and also by the public school and university system generally.

8085. Is the institution at Bristol conducted on those practical lines which you have described?—No, not wholly, a good deal of the teaching is probably very much like the usual teaching in a secondary school.

8086. So it does not wholly realise what you aim at?—No. I only cite it as an illustration of the need that was felt for organising every grade as one whole comprehensive scheme. I do not really know enough about the class teaching at the secondary school to say anything about it.

8087. You believe in the grouping of villages?—Yes. I would not have every elementary school a complete reproduction of every other as at present. One wants something like the Macdonald schools in Canada. I would not compel the children to attend the school, but I would put up such a school in a centre at a place like Berkeley, or in the hills and allow the children to come to it of their own accord, and after a time you will find the children will want to come, and you will be able then to close some of the smaller schools in the other villages. The Board of Agriculture are opposed to the closing of small schools, and quite rightly, because they say labourers will not go to the villages if you close the small school. You cart the children to the larger one where the instruction given is practically the same, and there is nothing to convince the parent that there is anything gained by going to the larger school, so they would rather go to the school at their doors, but if you give better instruction at the central school they will be anxious to come. Carting is a great economy. We closed one small school and carted 25 children two miles each way every day at a cost of £50 a year. You cannot carry on a school for 25 children under £80 or £90 a year at the very least, and we cart in several districts like that, but it is always resented by the people, and for the present we have given up attempting to compel them to submit to it. We rather rely on a successful experiment like Brimscombe, to bring them in of their own accord.

8088. Is there any trouble at Brimscombe in getting them there?—No. Some boys come in by train for four or five miles and some walk three or four.

8089. Are any travelling allowances made?—No, they come of their own accord.

8090. You think it would be an economy to close some

of the smaller schools and to take children in vehicles to the larger ones?—Yes.

8091. Further, you would have as little of the Code as possible in order to have as great variety of instruction in agricultural education as might be possible?—Yes.

8092. You think if there is this complete linking-up of elementary and secondary education then a great deal must be left to the people who control the secondary education in directing the method of instruction at the inferior school?—That is so—secondary and technical I should like to say.

8093. Then you expect a great gain from continuity in schemes of work and from keeping a definite and complete plan of education before scholars and teachers. You prefer that system to having constant changes?—Yes.

8094. So that the girls and boys too should know exactly what was ahead of them?—Yes. I would like them to see if they could on entering school what was ahead of them. That is why I attach some importance to these schools being established, running up to a polytechnic at the top. I would like to have the elementary school and the polytechnic, and in some cases a secondary school, all in one building, so that the boy can see there is something to go on to, which he does not see at present, and then the teaching should be as much as possible in relation to the industries of the district, whatever they may be.

8095. That involves the provision of facilities for various types of training?—Certainly, whereas there is only one at present.

8096. You consider at present there is too much of one groove in the training of teachers?—I do. It is hardly fair to say that teachers are trained at present because their education and training are so inextricably mixed up together. When a teacher is working for some academical examination and the whole success of his future career depends on the way in which he passes that he is not apt to think sufficiently of the professional training, nor does the college in which he is trained. I would separate the two entirely. I would have academic work and examinations done with entirely before the man came to be trained, and I should rather like to see training colleges aiming at producing teachers of very varying types. At present your agricultural instructor and your technical instructor and in many cases your secondary schoolmaster is not trained at all; it is only the elementary man; and he is really educated rather than trained. I would like to see some colleges training a teacher with a view to his going into technical work and engaging in organising and teaching from the elementary school upwards; and I would train in different branches of technical work, mining,

agriculture, textile work, iron work, and so on. I want them to be trained so as to look on the system of education as a whole from the top to the bottom. I do not want any teacher to think that his work with children is done when those children are 13, or any teacher to think that his work with children begins when they are 15, as the case may be. I want them to look at the thing as a whole. I quite agree there must also be training colleges of the exclusively literary type, and there always will be boys who will want to go on to the university and other places for working out a curriculum of a purely literary character. I would put that on a par with the rest, but I would not make the whole of the teachers' education and training literary.

8097. Your view is, of course, that a university degree is desirable, but that besides the university degree there ought to be institutions where teachers are trained for the purpose of exercising the methods of teaching which you have indicated?—Yes; I have found that the life in a good many of the elementary schools really begins to throb when you get the technical instructor in it. Our mining instructor in the Forest of Dean has found out the shortcomings of the boys who come from the elementary school, and he has been pointing them out, and I think in a very short time, if we adopt his suggestions and link up the work of the elementary school with his classes, really it will be the mining instructor who is the head of all the elementary schools there, and that is as it should be.

8098. Then with regard to inspection?—I have already said you may get very good advice, as we do from the inspectors on the technical side of the Board of Education, but it is all undone because you get the want of sympathy on the elementary side of the Board. I think you want the inspector, like the master and like the local authorities, to look at the scheme of education as a whole and to take a comprehensive view of it. I do not know whether I should be travelling outside my ground if I were to suggest a scheme of inspection.

8099. Then with regard to village reading rooms and libraries?—I say it is absolutely useless to give boys a really good education and make them anxious to learn and to educate themselves if you do not put some facilities in their way by giving them books to read. These boys have very few books of their own and they cannot get at them. I think it is a necessary corollary of education of this description that the boys should go on educating themselves, and they can only do that if you have these reading-rooms and libraries where they can go and get such books as they require. I want them to educate themselves and not to think that everything is done when they have passed at 13 out of the elementary school.

Mr. H. W.
Household.
12 June, 1907

SEVENTEENTH DAY.

Thursday, 13th June, 1907.

PRESENT:

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.
The Lord BELPER.
Lord MORETON.
Mr. DAVID DAVIES, M.P.
Mr. THOMAS LATHAM.

Mr. J. C. MEDD.
Professor T. H. MIDDLETON, M.A., M.Sc.
Mr. A. E. BROOKE-HUNT (*Secretary*).
Mr. H. L. FRENCH (*Assistant Secretary*).

(Lord BARNARD in the Chair.)

Mr. T. F. ROBERTS, LL.D., called and examined.

8102. (*By Lord Barnard.*) You are Principal of the University College of Wales at Aberystwyth?—I am.

8103. How long have you held that appointment?—For 16 years.

8104. You are well acquainted with the history of the

attempts on the part of that College to supply higher agricultural education?—I am well acquainted with them in a general way without being an expert in agriculture.

8105. Perhaps you will give us very shortly any information that you have. I think you have prepared a

Mr. T. F.
Roberts.
13 June, 1907

Mr. T. F.
Roberts.
13 June, 1907

summary of the work that has been done?—Yes. The beginning of agricultural education in connection with Aberystwyth College dates from as far back as 1876, four years after the establishment of the College, which was at that time maintained entirely by voluntary contributions from the supporters of education in Wales without any Government grant or any other public grant whatever.

8106. Would you tell us what the main lines of the College were at that time?—It was a University College with arts and science departments, but with a small staff of about ten or a dozen professors and lecturers. In 1876, a Carmarthenshire Welshman (Mr. Henry Parnall) having placed a sum of money at the disposal of the Council for the purpose, a course of lectures on agriculture was delivered in the College by Professor Tanner. Mr. Parnall may be regarded as a pioneer of agricultural education in Wales.

8107. Perhaps you will tell the Committee how far your other duties, as principal, cover the agricultural department?—I am principal, and in that capacity have a general responsibility for the agricultural department, but I have no expert knowledge; my knowledge belongs to an altogether different department. I may explain to the Committee, to save time, that the reason that I am here rather than an expert in agriculture is that it could not well be otherwise, the agricultural department having been reorganised during the present year, and a professor of agriculture having been appointed to undertake control of the whole work who has not yet entered upon the duties of his office. That is the reason why I, rather than a member of the agricultural staff, appear before the Committee.

8108. The agricultural department like all the other departments of the College is, I presume, more or less under your control?—That is so.

8109. You are well acquainted with what goes on in it?—I am well acquainted with what goes on. At the expense of Mr. Parnall, Professor Tanner's primer on the "First Principles of Agriculture" was translated into Welsh, and 20,000 copies of it were distributed among young Welsh farmers. He left a legacy of £5,000 to the College, which was applied towards the maintenance of the chair of chemistry, which was regarded as having a special relation to the industries of the district.

8110. What do the industries of the district include besides agriculture?—They are mainly agricultural. Courses of lectures were given by Professor Tanner in the College attended by the ordinary students and special courses for teachers, and the College was recognised as an institution in which scholarships for the principles of agriculture could be held. The attendance at the lectures proved insufficient to justify their continuance, and this early experiment in agricultural education came to an end. The present department of agriculture was commenced in June, 1891, when a lecturer in agriculture, Mr. T. Parry, was appointed. In October of that year the Agricultural Committee reported —

8111. What is the Agricultural Committee?—That was a provisional Agricultural Committee which was appointed at the start. In October of the year 1891 the Agricultural Committee reported that the total expenses up to October 2nd, 1891, including the salary and travelling expenses of demonstrator, &c., were £75 2s. 1d., against which they have received from the County Councils the sum of £150, and further, "hitherto the work has been confined to breaking ground by practical dairy demonstrations." The Committee, however, always regarded this as preliminary to the establishment in or in connection with the College of a complete system of technical and agricultural instruction for which they anticipated that a demand would soon arise, and they ventured to urge upon the Council that the question of laying down a scheme of such instruction should be taken into early consideration.

At the governors' meeting in October, 1891, the outline of such a scheme was submitted, to be subsequently worked out in consultation between the College and public bodies charged with the promotion of technical education in the central counties of Wales.

8112a The first prospectus of the department was issued for session 1891-2. In December, 1891, it was decided to apply for a grant from the Board of Agriculture. A grant of £250 was received in respect of the year ending March, 1892. In February of that year an assistant lecturer in agricultural chemistry, Mr. Murray, was appointed, and in November an assistant lecturer in agriculture, Mr. James Wilson.

The seven County Councils of central and western Wales made grants for the work done within the area during the year 1892-3 as follows:—

Cardigan	£250.
Pembroke	£100.
Brecon	£100.
Radnor	£100.
Carmarthen	£350.
Montgomery (for part of the county) ..	£110.
Merioneth (for part of the county) ..	£160.

These first grants were applied to the following objects:—

- (1) Travelling dairy schools.
- (2) Extension lectures.
- (3) Teachers' classes.
- (4) In the case of two counties—Cardigan and Carmarthen—to scholarships or exhibitions tenable in the Agricultural Department of the College.

8111c In November, 1892, also, instead of the previous Agricultural Committee, an agricultural and technical Instruction Committee was constituted, six of its members to be appointed by the College and three by each subscribing County Council.

In March, 1893, a deputation to the President of the Board of Agriculture sought a larger grant from the Board on the grounds:—

- (1) Of the needs of the agricultural curriculum within the College, for which the limited fund at the disposal of the County Councils made it impossible for them to provide.
- (2) The very large area in which the out-College work was conducted, and the large sum (amounting to two-sevenths of the gross receipts in 1892) expended in travelling and transit owing to defective means of communication in large portions of the counties.

These are seven typical counties in central Wales, and the difficulties of transit are very great.

8111e The work developed rapidly, and the grant from the Board of Agriculture rose from £250 to £500 for the year ending 1893, and to £800 in 1895.

In the report for 1893-4, the work done was stated to include:—

- (1) A two years' in-College course organised for the diploma of Associate in Agriculture.
- (2) a A six weeks' course for County Council scholars in dairying.
b Travelling dairy schools.
- (3) a Lectures to farmers at various centres.
b Illustrations in manuring.
- (4) Courses in agriculture and chemistry to elementary teachers at the College combined with laboratory practice.

8111f Summer courses were held at the College in August, 1893-4. They included several groups, among them chemistry, agriculture, botany, zoology, students being required to select one group.

In January, 1893, Mr. Parry made a supplementary report to the Carmarthenshire Technical Committee suggesting:—

- (a) That a further grant of £100 should be applied to assist scholars from the county to take the two years' in-College course.
Holders of similar County Council scholarships from England were reported to be in attendance.

The following Scholarships were offered for competition in September, 1893:—

- | | |
|--|-----------------------|
| 3 Open Exhibitions of £10 each (by the College). | |
| 4 Scholarships at £25 (by Carmarthenshire). | |
| One Scholarship of £25 | } (by Cardiganshire). |
| One of £15, and one | |
| Exhibition of £10 | |
| One Exhibition of £10 (by Pembrokeshire). | |

- (b) That a further sum of £150 be applied to 12 Scholarships of £12 each to farmers' daughters and others in the county to enable them to take the six weeks' summer course in Dairying. Six pounds to go towards the maintenance of the pupil and £6 to the College for the cost of instruction, cream, milk, etc., tenable by candidates who had already passed the travelling dairy schools.

Twelve candidates were selected out of about 40 candidates for the first course. Cardigan and Pembroke similarly gave six Scholarships of £6 each; 25 in all attended the course, and qualified for the Advanced Certificate, recognised as entitling holders to earn grants as teachers, under the Code (Art. 101 (i) Specific Subjects). The 25 scholars had on an average about 18 cows in their home dairies.

8111 g Five travelling dairy schools were equipped and 12 pupils were instructed for a fortnight at each centre, but such was the demand that the school frequently stayed from four to eight weeks at the same centre. Up to September, 1893, a total of 630 pupils had been admitted to the schools, 584 gaining the Elementary Certificate. County competitions were organised in Pembrokeshire and Radnorshire by farmers' clubs and agricultural societies, limited to pupils who had passed through the travelling schools.

8111 h The extension lectures aimed at improving the quality of butter and increasing the produce of the soil, by introducing modern methods of manuring. In connection with the lectures, field trials on the improvement of pasture were organised on an extensive plan. At one centre, Llandinam, 60 tenants were supplied by the landowner, the late Mr. Edward Davies, with manures for the experiment of improving poor pasture, and in various other centres there was considerable effort made both by landlords and tenants in putting the trials into operation. Experiments were also commenced by the lecturer in agricultural chemistry, also a list of charges to farmers in the affiliated counties was issued for analysis of soils and manures.

8111 i In 1893-94 a further course of two weeks was added to the summer dairy school. It was reported that by now, the prejudice against the new methods shown and explained in the travelling dairy schools had largely disappeared, and that farmers readily acknowledged their helpfulness.

8111 j A dairy school was equipped in four rooms in the basement of the College, for butter-making and for producing six varieties of cheese. After three years' uphill work, technical instruction in dairying was reported to be fully organised in the seven counties. By an arrangement, resulting from a conference of the County Councils' representatives, the lecturer in agricultural chemistry was appointed analyst under the Fertilisers and Feeding Stuffs Act for the seven counties.

In 1894-95 a ten-weeks' theoretical course of instruction in Dairying was added, completing a twenty weeks' course of training for dairy teachers. Ten students joined it.

8111 k Travelling cheese schools, giving ten days' instruction in the centres, were now first started, "the very serious fall in the price of butter having compelled the farmers to turn their minds to cheese-making as a possible source of income," and "were taken up with satisfactory results, and without the slightest opposition from the farmer"; a very different experience from that of the dairy school—"for even now, after years of labour, the country people cannot be persuaded to touch the prime fresh but slightly salted butter made in the schools, although it readily sells at the highest prices in the large towns."

8111 l The manurial demonstrations continued to extend, and suitable permanent seeds, with a proper guarantee, were recommended by the lecturer. These experiments were carried out entirely without aid from the County Councils. In that year also the first six weeks' short course for young farmers was held in the College. That was a very important departure, and I believe that the College was the first in the country to organise short courses of this kind. It is also noteworthy that the young farmers were drawn from so large a range of counties, so that they met one another and were able to discuss agricultural questions among themselves over a wide and varying district.

In the report for 1895-96, a list is given of some 45 landowners and farmers who have devoted from two to ten acres of land to experiments at a cost of from £8 to £40 each. The short course experiment in the previous year is reported to have proved a complete success.

8111 m The Rev. John Owen, assistant lecturer, stated that "these short lectures for young farmers will affect this class very extensively throughout the college district, I should say, will affect it to a far greater extent than the ordinary classes of the college, principally because a greater number of those actually engaged in farming will attend the short course lectures."

8111 n In his report for 1896-97, Mr. Parry gives an interesting account of a visit to Denmark and Sweden, where he was requested to attend a Conference of the British Dairy Association. He calls attention to the fact that the principles of co-operation were carried out

in Denmark and Sweden to an extent unknown among British farmers; to their superiority in the matter of agricultural and technical association; to the system of peasant proprietorship; to the extensive and economically managed butter factories, assisted by the consulting dairy experts appointed by the State and by the staff of the Research Laboratory of the Royal Agricultural and Veterinary College at Copenhagen. The report includes a detailed account of agricultural education in Scandinavia.

The report of that visit was published and distributed amongst the various counties, and it was also published and distributed in Welsh at the expense of the College. I believe the publication of such documents in Welsh as well as in English has had a very considerable effect upon the minds of the farmers in Wales.

In 1897-98 a three-years' course was first arranged for the degree of B.Sc., in Agriculture of the University of Wales.

The travelling dairy schools on the old lines were practically abolished, having served their purpose, the funds formerly devoted to them being now allocated to the advanced dairy school at the College, and to the farmers' short course.

A short course in cookery was also arranged for the holders of the dairy scholarship, part of the course being applied "to the utilising of the fruits, roots, and vegetables growing wild in rural Wales, and to a large extent wasted." A survey of the entire work from June 1891 was added to this year's report, p. 6-13. I will hand that in. It shows the very wide district and the very large number of small village centres at which the work was carried on.

In the College, an advanced short course was now held for the first time, beginning the end of October, and lasting 16 weeks, for the best pupils in the short course; attended by five students, one a county council scholar. Staffordshire and Breconshire for the first time sent scholars to the short course. A reunion took place at its close, and resulted in the formation of the University College of Wales Agricultural Association, which has since held annual meetings and published its proceedings. I have the report for the last two years showing that there are some 250 members belonging to the Association, all of them being short course students.

The College garden proved of great service, being visited by the students once a week in winter, and twice a week or oftener in summer. The sowing, weeding, and thinning of all the crops were done by the students, specimens of varieties of British crops were grown and preserved for classroom use, and a number of small experiments were undertaken, and reports were made on them by the students at the end of the Easter term.

The Agricultural prospectus was rewritten, chiefly in view of the new degree regulations and the alteration in the short courses. In 1898-99 Mr. Middleton resigned the in-College lectureship, when Mr. D. D. Williams succeeded him.

New premises were opened for the use of the Agricultural Department containing separate lecture rooms for agriculture, and a lecture room and laboratory for agricultural chemistry, adjoining the laboratory of the district analyst under the Fertilisers and Feeding Stuffs Act. A conference of the County Councils was summoned, and they appointed the agricultural chemist to be analyst under the Fertilisers Act for the whole district; the object was to make him analyst for the whole area.

8112. Has that worked well?—That has worked well.

8113. It is still in operation?—Yes, and I may say that this year the number of samples is greater than ever, and we are hoping, under the present Fertilisers and Feeding Stuffs Act, that it will still develop. These buildings are in what is called the central block, which cost £15,000, of which at least £3,000 may be set as directly applied for the agricultural subjects. They were built and equipped as the dairy school previously was provided, without any grant from the County Councils.

In May of that year Mr. J. L. Pickard was appointed instructor in horticulture. In July Mr. Murray took a party of students on a visit to Rothamsted, where they were received with much kindness by Sir Henry Gilbert. Several sent accounts of what they saw to Welsh papers. Many members of the Agricultural Association agreed to carry out on their farms field experiments as arranged by Mr. Murray.

Mr. Pickard gave a course of lectures and demonstrations in gardening in Mid-Aeron, including:

(1) Demonstrations to school children in window-gardening, potting, and training plants, &c.

Mr. T. F.
Roberts.

13 June, 1907

Mr. T. F.
Roberts.

13 June, 1907

- gardening, potting, and training plants, &c.
(2) Demonstrations in bee-keeping in the gardens of cottagers.
(3) Garden demonstrations.

Ten lectures were given in the district on such subjects as model cottage and school gardens, roots, crops, leeks, bush fruit, &c.

The chief difficulty found was in finding suitable garden tools—those in use in the district being too old and clumsy.

The Secretary closes his Report of the course by urging the Cardiganshire Technical Instruction Committee "to undertake to provide and maintain a model allotment garden where the instruction may be limited and thorough."

8113d In the report for 1899-1900, in connection with the short courses, the lecturer, Mr. Parry, reports: "There is nothing in Welsh agriculture of to-day so full of promise as the remarkable awakening that has taken place in connection with these classes."

8113e The number of students in attendance during the year was very satisfactory, this result being mainly due to the systematic way in which the extension lectures had been carried to the remotest villages in the various centres. The lectures in horticulture proved successful immediately, and took up the whole time of the lecturer, as they have done ever since.

8113f In 1900-1901, the number of students obtaining distinctions in external examinations was very gratifying, and the work of the advanced short course students received high commendation, Mr. Williams, remarking: "It is surprising how these men apply themselves to the work, and what a vast amount of knowledge they acquire in a few months, when we consider how the intelligence naturally loses force during the long educational gap between school and college. To my mind, this is one of the most successful experiments yet tried by the College."

A suggestion is made in reference to the work of the secondary schools, that a conference of representative headmasters of County schools should be held with a view to seeing what steps might be taken to establish a closer relationship between the Agricultural Department of the College and those schools.

8113g Experiments in the introduction of new varieties of oats, potatoes, swedes, turnips, &c., were arranged for the first time in South Wales. I have here all the published reports of the experiments, which I will hand in. The Agricultural Association received a large accession of numbers, and discussed a plan of co-operation in the purchase of manures and feeding stuffs. It held a successful meeting at Cardiff on the occasion of the Royal Show.

The Director of the Experimental Stations of Canada, Dr. Saunders, visited the College and gave an account of his visit in his report for the year.

8113h The work in horticulture continued to develop, a schoolmasters' summer course being a new and successful feature. As regards the bee-keeping lectures, the absence of a market for honey is remarked as the chief difficulty. It is suggested that the Welsh Industries Association would do well to take the matter up. Pupils of the advanced dairy school held a prominent place in the competitions in local shows, and also in the London Dairy and Royal Shows. There was a very ready sale for all the dairy products, which fetched a higher price than in any previous year.

8113i The Report for 1901-02 records the successful introduction of the new scheme of education adopted by the Council in 1901. The short course, instead of being held in January, was changed to October, and followed by a continuation course held in the Lent term. These two combined counted as the first year of the diploma course, and a third year diploma course was required, the instruction previously given in two years of three terms being now spread over a three years' period of two terms each. Degree students alone continued to study for the three terms of the session.

8113j Mr. Williams adds an instructive Report of a visit paid by him with a deputation of Welsh farmers to Ireland, to investigate the system of co-operation in that country. A visit to the model farm at Glasnevin proved instructive to the members of the first conference held at Aberystwyth in July, 1902, to discuss the question of securing an experimental farm for the College. Mr. Brigstocke, the pioneer of the co-operative movement in Wales, showed his interest at this time in the College by offering three exhibitions of £10 each to students from Cardiganshire, Carmarthenshire, and Pembrokeshire, to take a course of lectures in the principles of co-operation. Mr. Williams, the in-College

lecturer, devoted considerable time to lecturing and addressing local meetings held with a view to forming branch societies. He hoped soon to promote this work still more effectually by training a few Welsh-speaking farmers' sons to carry on this work. It is worthy of note that a short-course student, Mr. Walter Williams, has since become the active organiser of co-operative societies in the district, besides having acted as the assistant of Mr. Loveden Pryse in establishing the Welsh National Agricultural Society, whose large show has been held for the past two years at Aberystwyth.

A list of the Welsh Co-operative Branch Societies is given 8113k in the Report of the Agricultural Organisation Society for 1904, and the President, in his address in the annual meeting for that year, says: "Wales has taken a deep interest in the movement, which has gained a hold on the Principality. In Wales, in the not far-distant future, they would find a brilliant example of the advantages of co-operation as applied to agriculture. Last year the number of centres had risen from 10 to 20," showing in that way the effect of the instruction given by the College, and especially the success of the co-operative movement in Wales.

The instructor in horticulture reports on the great 8113l demand for extension lectures and demonstrations, and specially refers to the great interest taken by schoolmasters in the matter, and the assistance rendered by them in their various districts.

A large increase is reported in the samples analysed 8113m especially from Carmarthenshire, and the analyst made a special arrangement with the Council of that county for analysis of soils with a view to reporting on their manurial requirements.

It may be worth mentioning that a short summer 8113n course in the dyeing of woollen fabrics was held for the first time during this year. The subject has a bearing on the agricultural life of those districts, and the experiment made for a period of some two years under a special grant from the Councils of Cardigan, Carmarthen, and Montgomeryshire proved of much service in calling attention to the process of dyeing, especially in the small factories.

The instructor, Mr. Wilkinson, visited each factory in his district, and made practical suggestions, also giving lectures and practical demonstrations by the aid of the dyeing plant he took with him to the centres, besides holding a short course in the college in the summer.

8114. In what way is dyeing associated with the agricultural industry?—I refer to it because it shows the possibility of promoting accessory industries such as the one in question as part of the scheme of instruction in agricultural areas.

In the report for 1902-03, the year is described by 8114a Mr. Williams as one of the most successful years on record, the numbers attending in various classes being as follows:—

Degree Students		3
Third Year Diploma Students		13
Second Year Diploma and Advanced Short Course		8
First Year Diploma and Continuation Short Course		13
Farmers' Elementary Short Course		38

Out of five successful students in the N.D.A. examination this year, four entered the College as short course students from the farm. They had the language difficulty to encounter, "and are examined in the English system of farming so different to ours with which they can only become acquainted by means of lectures."

As regards co-operation, the strongest supporters of the 8114b movement for its spread are stated to be members of the Agricultural Association.

The report of Mr. Nugent Harris on the work of the two students holding the co-operation exhibition is included.

The late Mr. Hanbury visited the College in December, 8114c 1902. He addressed the students of the Agricultural Association, and spoke on the same day to a large conference on Agricultural Co-operation organised by the College, promising favourable consideration of the application for a grant-in-aid of the proposed Joint College and Counties Experimental Farm.

This project was first mooted by a circular addressed by the Registrar to the affiliated counties in April, 1902, asking them to appoint representatives at a conference to discuss a scheme to secure a farm for the systematic conduct of experiments and investigations.

The absence of a farm was also felt to be a serious obstacle in the further development of the training of the students,

The conference of county council representatives approved the project and the scheme submitted for *pro rata* contributions towards the maintenance and equipment of the farm, the control of which was to be vested in a joint committee, consisting of four representatives of the Council of the College, and of representatives of each contributing council in the following proportions:—Brecon, 2; Cardigan, 2; Carmarthen, 4; Merioneth, 2; Pembroke, 3.

It was found to be a very difficult task for students under the old conditions to attain to the high standard necessary for the diploma.

8115. You finally got a farm of 180 acres at a rental of £200 a year?—Yes.

8116. You still have that farm?—Yes. Two annual reports on the work of the farm have now been issued. These are the two reports. (*Handing in same.*)

8117. Since that time Radnorshire has joined in the scheme?—Yes.

8118. So that you now have six counties?—Yes.

8119a. Then you say something about school gardens?—Yes. In the report for 1902-03 the Instructor in Horticulture referred to the large number of horticultural shows annually held in the district as the result of the classes, and expresses the hope that under the new education authorities some provision will be made for establishing school gardens in all village schools. Practically all schoolmasters are now anxious to take up the work, if only a plot of ground and suitable tools were provided for them. I may quote a short passage from his reports of 1905-06. The instructor in Horticulture remarks on the keen interest in gardening shown by young men, nearly all the prizes at horticultural shows during the year being taken by young men. He adds "it is difficult to realise, and still more difficult to express, the enormously increased use that is made of fruits, vegetables, and salads as foods in mid-Wales during the past five years, especially so in the Towy Valley, the Amman Valley, and in Cardiganshire."

8119b. Commenting on the absence of great increase in school gardens, he says: "Another class of my work, however, nature study, has made wonderful progress. Seven years ago it was rare to find a teacher who either knew or cared anything about wild flowers, or any insects. Interest in and intimate knowledge in these subjects is now become universal, and in nearly every school an attempt is made to collect, classify, and record local flowers, ferns, grasses, and insects. I am assured by school teachers that their scholars take a greater interest in these subjects than in almost any other part of their school work."

8119c. Three students from Glamorgan attended the summer dairy school for the first time in this year 1905-06, and the senior instructress urges that before another year the College authorities should erect a proper dairy. An exhibition was again held at the Aberystwyth National Show. This shows that the work of the dairy school is likely to extend even to Glamorgan for the purposes of agricultural education.

8119d. In the summer of 1906 a special committee of the Council was appointed to consider and report on the working of the Agricultural Department, and in pursuance of recommendations made, a professor of agriculture, Mr. C. Bryner Jones, M.Sc., has recently been appointed to undertake the supervision of its whole work. The further reorganisation necessitated by this change has occupied the attention of the Council during the present year. The new system is to come into operation when the Professor enters on his duties in July. In view of this fact, I do not propose to make any general suggestions as to the future development of the work, but I may point out that the principal requirement is in the direction of increased aid to the advanced work, including that of investigation and research.

8120. Increased aid from what source?—I think the aid to that should come principally from the Board of Agriculture.

8121. You think it is a work of national importance?—Undoubtedly.

8122. You have carried on a certain amount of investigation and research work?—Yes, we have; a certain amount.

8123. The value of the work you have done makes you think that it ought to be extended?—Certainly it does.

8124. Have you formed any opinion as to the form in which that State aid should be given—in the nature of a grant, I suppose?—In the nature of a grant; and it appears to me that it should be in some proportion to the grants made by the local authorities, but I feel pretty strongly,

as the result of our experience that the proportion of the grants in aid from the State should be a very large one to the grants made by the local authorities, on the ground that the county authorities in Wales, and especially in the agricultural districts of Wales, are poor; their resources are limited so that they cannot be expected, in view of the other claims upon them, to contribute towards investigation and research, or towards the higher side of the work in agriculture.

8125. If State assistance were given for this purpose I suppose you would have no objection to the results being to a certain extent the property of the State?—No objection whatever.

8126. That is to say that the Board of Agriculture, or whichever public authority had the control would be entitled to any benefits which you acquired?—No objection at all; we should welcome that. In order to show the importance of a large proportion of aid from the State to the higher work I may mention that the County Council grants that we have received have been absolutely limited, with the exception of the grants to the College farm, to work of direct use to the respective counties, that is, either to lectures and demonstrations in the counties, or to paying the fees and part-maintenance of students in the short courses and dairy courses.

8127. That would be in the nature of scholarships or bursaries, would it not?—Undoubtedly, but they are given to the elementary parts of the work. The local authorities have hitherto shown some reluctance in giving scholarships for the more advanced part of the instruction given in the College, the reason being that a larger number of students participate in the small grants and the benefits are more apparent to the inhabitants of the county itself; and also it has been alleged by members of the different County Councils that if they subsidise students to pursue an advanced course of instruction in agriculture, those students are liable not to return to the county or not to return to the farms.

8128. There is no hostility, then—in fact, I think from what we know of Wales they are not likely to be hostile—to the development of knowledge on such a subject, but merely because they think that such knowledge is not going to benefit those counties?—Entirely—not going to benefit the locality. They are keenly interested in the development of higher instruction in agriculture, but they do not think it has a local claim on the several funds of the counties. Scholarships for the two years' course offered by the counties were soon discontinued, and ever since the grants under this head have gone to the popular short courses. A large provision is needed for scholarships enabling qualified students to take the degree course and after graduating, to continue in residence for research, an object which should be promoted principally at the expense of the State, in order to enable the colleges to provide teachers qualified not only to teach but also to undertake the direction of investigation, and to provide a supply of post-graduate students to whom scholarships covering the bare cost of sustenance should be given while they are engaged in this work, and can show satisfactory evidence of progress. In view of the limited resources at the disposal of these counties, which together form one of the most important agricultural areas in the Kingdom, and in view of the heavy charges in respect of secondary and primary education which they have to meet, the proportion of aid to higher agricultural education from the State to that borne locally should, in my opinion, be not less than two-thirds to one-third, or some such proportion. Such a proportion is justified also by economic and social considerations of great importance in their bearing on the country as a whole and the great centres of population.

8129. I suppose the number of students who would be likely to take a degree would never be very large?—It has hitherto been small.

8130. But at the same time it is of considerable value?—Yes. It is from that class that the real experts in agricultural science are drawn, that the teachers of the country are supplied, and also that all expert knowledge is available for the development of agriculture.

8131. Do any of your students become teachers in the colonies or in foreign countries?—We have not had any as yet who have gone.

8132. What class of students are they who take the diploma course? What becomes of them—do they become practical farmers?—They come, as I said, chiefly from the farms to the short courses and then they mainly return to the farms, but some of them have obtained such positions as those of lecturers and dairy factory managers;

Mr. T. F.
Roberts.
13 June, 1907

Mr T. F. Roberts. for instance, three of them, I believe, have been appointed lecturers in a college similar to our own, and there are other instances of the same kind.

13 June, 1907

8133. Now as to the finance, because you have touched very largely on finance, can you very briefly state the sources from which the funds for this department are derived. First of all there is the Government grant?—Yes, there is the Government grant and in addition to that there are the grants of the County Councils.

8134. Have you any endowments of any sort—you mentioned a legacy of £5,000 towards a chair of chemistry?—We have only some £15,000 in the way of endowment altogether.

8135. Do you receive any fees?—We receive fees from the students; for example the fees for this year from the students amount to about £260; it is not a large amount.

8136. Do they pay them out of their own pockets or from scholarships given by the County Council?—They pay them very largely from scholarships given them.

8137. What does it cost a student to live at Aberystwyth?—A student living there a whole year would be able to do it for some £40, or even less with economy.

8138. It is scarcely fair, I think, to ask you to give information as to the more practical management, and perhaps under the circumstances, as changes are contemplated, it will hardly be necessary, but I do not know whether you have any opinions at all on the result of the local lectures which have been given?—I think there is no doubt that they have had the very greatest effect in changing the opinion of the farmers and making it favourable to scientific agriculture, and especially the young farmers have been deeply influenced by them, so that I think we may reckon throughout the whole of the district the young farmers are enthusiastic on behalf of the scientific developments of agriculture.

8139. The farms in the main are small, I suppose?—They are.

8140. Are they chiefly mountain farms in your district?—Chiefly.

8141. You know nothing about the College farm, I suppose—you do not know what the stock is on the farm, do you?—I am afraid I could not tell you that, but my co-witness, Mr. Jones-Davies, will be able to speak on that point.

8142. Perhaps he can tell us about the feeding experiments too?—Yes, I think he can tell you about those.

8143. (*By Lord Moreton.*) You mentioned just now that several outside lectures had been given in Welsh and also that Professor Tanner's Primer had been translated into Welsh. Is it a *sine qua non* that your professors should speak Welsh?—It is practically so, that is to say we must have a majority of the staff of the department able to speak Welsh.

8144. Do you find that the fact of Welsh being necessary rather limits your choice of teachers?—I think in some degree it has done so. At the same time up to the present we have not allowed the need, great as it is, of Welsh instructors to induce us to appoint teachers manifestly inferior in other respects. We have preferred Welsh applicants only where the merits seemed to be approximately equal.

8145. Do you do anything with regard to teaching forestry?—We have done nothing so far; there have been courses given in the College for in-college students.

8146. You have not taken it up seriously as part of the curriculum?—We have not done so as yet.

8147. You mentioned a little while back the examination for the National Diploma in Agriculture, up for which, I know, from time to time you send pupils. Do you think it would be an improvement if instead of that diploma examination being held in one centre in England it could be held in various centres in England and Wales, and if that examination could be made of rather a more practical form—by that I mean that the examination might be held on a farm, possibly a college farm, and that a great deal of the examination should be held out of doors not only in agricultural but possibly in matters of science affecting agriculture. Would that be an improvement in your opinion?—So far as I can judge I think it would be an improvement. I think it would be an improvement particularly to have it held at various centres because it would enable the students to bring their knowledge of agriculture in those particular parts of the country more fully to bear I should hope.

8148. If such an examination were held in a Welsh centre am I to think that the examination would have to

be held in Welsh to make it absolutely fair?—I do not think that would be necessary.

8149. (*By Mr. Latham.*) Just describe shortly what your agricultural part of the College is?—There is a professor of agriculture, a lecturer in agriculture, and an assistant lecturer in agriculture; then there is a lecturer also in agricultural chemistry; there are instructresses in dairying, butter and cheese-making, and there is an instructor in horticulture. I think those are the members of the agricultural staff. Then as regards the equipment and buildings there is the College farm about four miles away, which is under a director who is one of the members of the College staff, now the professor of agriculture, and a bailiff. Then in the College there is a special laboratory for agricultural chemistry, and there is the laboratory of the analyst under the Fertilisers and Feeding Stuffs Act close by, so that the students are able to see analyses going on. There are various lecture rooms for the agricultural students, and in the basement of the College there is a large dairy equipped for butter and cheese-making.

8150. What time do you expect the students to spend at this farm?—I believe the practice hitherto is that they are taken over two afternoons a week during the two winter terms. It is the intention that students who have not been on farms before entering the College should spend four months a year on the farm.

8151. How long does that course last?—The course for the diploma lasts three years and the course for the degree also lasts three years.

8152. Are the County Councils of the several counties adjoining in close touch with the College?—They are in the closest touch. I have here a list of the grants they have made to the College covering a period of years and I have also a list of the grants that they have made to the farm within the last two years.

8153. May we take it that these figures are figures showing what you have received from the six counties. Does Radnor help you at all?—Radnor helps us for the farm now; it contributes in that way; it has done very little otherwise. For a number of years it gave nothing; it is a very small county, as you know, and I believe they found it difficult to give anything.

8154. Almost all these counties rose a little at one time in their contributions, but they are now going back considerably?—Yes, I am glad to have the opportunity of mentioning that; that has been due largely to the changes resulting from the Education Act of 1902; for instance, there is a reduction of £300 in the grant from Carmarthenshire, which is due to the altered circumstances created by the changes made by that Act.

8155. Do these counties all offer scholarships to your College?—The majority of them offer scholarships to the short courses to which I have referred.

8156. I thought the scholarships were of such very small value. Are they of any increased value now?—The scholarships for the short courses have been of considerable value considering the time the student has to spend at the College.

8157. How long is that?—The short course is seven weeks, and the advanced short course is 16 weeks.

8158. What are the scholarships?—The scholarships for the short course would vary from £6 to £10; that includes a grant towards the maintenance and the payment of the fees for the course to the College.

8159. How is the rest made up?—By the student himself from his own resources.

8160. Are the students sons of men of large means or small means?—In the great majority of cases they are sons of small peasant farmers.

8161. Do you find the sons of the larger farmers are anxious to join the College?—Yes; we find that even the large farmers are desirous that their sons should get these scholarships. It is one ground of criticism I think that a considerable number of farmers who could afford to send their sons without receiving any grant in aid receive grants in aid from the county authorities, but I think it may be taken that in the great majority of cases the parents of the young farmers are poor in circumstances.

8162. Is this agricultural teaching looked upon by the farmers of Wales with great favour?—With great favour. There has been a marked change in that respect since the work has been going on.

8163. Are there more students applying to come to the College than you have the opportunity of taking?—

No, I cannot say that, but I believe that that will be the case more in future. We have in Wales a system of intermediate schools which has been at work for some years and is likely to equip and prepare an increasing number of pupils, every year, who will require advanced agricultural education.

8164. In almost the last remark in your *précis* you say, "A large provision is needed for scholarships enabling qualified students to take the Degree Course, and after graduating, to continue in residence for research, an object which should be promoted principally at the expense of the State, in order to enable the colleges to provide teachers," and so on. You think there are more students wishing to come than there are scholarships to allow them to come?—Yes. There are very few scholarships, in fact hardly any at all given for the most difficult course, the Degree Course, and I think if scholarships were offered for that course it would enable a great many more students to pursue it.

8165. Can you tell us anything about the experiments that have been carried on by the department?—I am sorry I cannot do that. All I can do in that connection is simply to hand in the reports of the experiments that have been carried out.

8166. I suppose the same remark applies to your dairy school?—Yes.

8167. You say, "The proportion of aid to higher agricultural education from the State to that borne locally should in my opinion not be less than two-thirds." Is not that rather high?—It does not seem to me too high when you consider the circumstances of the counties with which we are connected. They are purely agricultural counties with the exception of Carmarthenshire, which has also a considerable mining element, and they have very heavy charges already in respect of education upon them; so that I think the proportion of two-thirds from the State for higher agricultural education would be about a just one.

8168. Considering the enormous amount of money taken from the ratepayers for elementary education—does that qualify that remark?—No, I think it only goes to justify it, that if the local ratepayers are heavily burdened for education that there is good reason to follow the example of other countries in promoting the higher branches of instruction and investigation through the State from the central exchequer.

8169. Is it fair to take it that the large majority of the ratepayers in your counties are agriculturists?—They are.

8170. Would not the larger farmers be able to bear a third if the County Councils bore a third and the State the other third?—I fear not; I fear that the higher education in agriculture would suffer if it were attempted to carry it on by means of such a large proportion locally borne.

8171. (*By Professor Middleton.*) Your opinion is that the duty of promoting higher education should be work for the State as apart from the local authorities?—Yes, that is my opinion broadly.

8172. Could you justify the State's action in this respect by the effects of investigation and research upon the lower grade education. You would consider, I suppose, that the lower and general types of education would not be satisfactory unless they were associated with some means for providing fresh knowledge?—Entirely so. I think the efficiency of all grades of education very largely depends upon its being related to a very efficient provision for the highest grade of education both for teaching and for investigating.

8173. That higher type of work which you referred to just now acts upon the lower grade, I think you will agree with me, by promoting a desire for knowledge, that is to say, unless you provide new types of knowledge you will not get the desire for knowledge continued in the lower grades of education?—Yes, I believe that to be so. I believe that knowledge is apt to become mechanical and to lose interest unless it is fed continually by those who are acquiring fresh knowledge for themselves and in actual contact with new problems.

8174. That is why it becomes the duty of the State to provide for research and investigation?—Yes, I think that is one of the chief grounds for that duty.

8175. You have told us that you have had in Wales a number of students attending your short courses. The elementary short course I think you said is attended by from perhaps 30 up to about 50 students per annum?—Yes. I have handed in a list of the numbers attending year by year—it is from about 30 to 50.

8176. So that a number of the farmers who are now farming in Wales have been to the University College at Aberystwyth?—Yes, the great mass of young farmers in the counties have been actually in the College for these short periods of seven or eight weeks and in that way have been in actual contact themselves with the life of the College and have seen the laboratories to some extent and the work that is done there, and I think that has had a surprising effect in their attitude towards the scientific side of their calling.

8177. In your College Agricultural Association you have something like 250 members?—Approximately.

8178. Practically everyone of whom is a young Welsh farmer?—Yes.

8179. Everyone of whom has spent some part of his time in the University College?—That is so.

8180. Is it not the case that a number of these young men carry out field experiments with manures in connection with the College?—Yes, about 60 members of the Agricultural Association, that is, former short-course students, were engaged in one year in carrying out experiments.

8181. Your Society also has annual meetings at Aberystwyth and you invite agriculturists and others from a distance to read papers before the Society?—Yes, they are generally addressed by some well-known agriculturist, or more than one, during the annual meetings which take place in December.

8182. Your main object in your Agricultural Association is to maintain a permanent link between the College and the young farmers in Wales?—That is the main object.

8183. I think we may say that up to the present time you have been remarkably successful in that respect?—Exceedingly successful. I do not think we should ever have been able to establish the College farm in the way we did but for the fact that these young farmers in each of the counties were keen supporters of it and were able to convince the local authorities that it was worth the while of the counties to contribute to such a scheme.

8184. Have these short-course students been through your intermediate schools?—Very few of them.

8185. Have many of them been at evening continuation schools?—I should think that a large proportion of them would have attended evening schools in some form or other, but there is a considerable dearth of evening schools in the rural districts of Wales.

8186. Do you think that the intermediate schools may have an indirect effect upon the short-course students?—Yes, undoubtedly. We find of late years that an increasing proportion of the short-course students have been to the intermediate schools, and that therefore they are better equipped, but in the main it is still the case that the majority have not been to the intermediate schools.

8187. You told us, I think, that you had not received much in the way of legacies or donations actually for the agricultural department; but is it not the case that the agricultural department at Aberystwyth has very greatly benefited by donations and grants for the erection, say, of such buildings as the chemical laboratory?—Indirectly in the greatest degree; for instance, at the present time we are building very large chemical laboratories which have been provided by the members of the family of a member of this committee at an expense (inclusive of cost of site, &c., borne by the College) of £25,000, and I may say that one of the principal purposes of these laboratories is to make provision for scientific investigation in matters relating to agriculture, that being regarded as the chief industrial direction in which the College can help.

8188. Is it not the case, too, that the agricultural buildings which you erected were very largely provided by the Welsh people?—There was a grant from the State made of £10,000 at the time towards the building, but to meet that grant some £5,700 were contributed voluntarily in about six months in response to the condition attached to the building grant. I may mention that the buildings of the College as a whole have cost some £100,000, roughly estimating the cost, and that out of that we have not received any grants from the State or from any public authorities except the £10,000 to which I referred, so that the buildings as a whole may be said to have been provided by voluntary aid.

8189. (*By Mr. Medd.*) You have, I think, seven counties affiliated to you, have you not?—We have.

8190. The reason why Radnorshire has not recently given much is that it has only become affiliated within the

Mr. T. F.
Roberts.
13 June, 1907

Mr. T. F.
Roberts.
13 June, 1907

last year or two ?—It has been affiliated from the beginning, but being a small and poor county it made no contribution for a considerable number of years ; it made small grants at first, and then within the last two or three years it has again made grants towards the farm.

8191. Up till the last year or two it had no definite connection with you ?—No actual connection.

8192. Have you heard any objection as to the affiliation of Montgomeryshire and Merionethshire to you with regard to the difficulty that arises geographically through people who live in one part of the county having to get to Bangor and so on ?—No, I cannot say that I have heard much objection.

8193. One of our witnesses here, an important witness, suggested that the northern half of Merionethshire might appropriately now go to Bangor, and Montgomeryshire might come more to you. You divide Montgomeryshire as it is, do you not ?—Yes ; at present we have the western and southern portion of Montgomery because the University College of North Wales commenced agricultural education before we did, and were at work there before our department was established.

8194. Do you find any difficulty arise from the fact that you have a half county—any difficulty in the local administration ?—I think there are certain difficulties that arise, and I must say that I should not be willing to see Merionethshire broken up between two authorities because I think it is very much more advantageous to work the agricultural education of a county as a whole from one centre than to divide it. Of course, I make no objection in the case of Montgomery because that was the state of things when we started.

8195. Montgomery is a large county, I suppose ?—Yes.

8196. You could hardly take the whole of it without depriving Bangor of a very considerable area ; that is what it would amount to ?—Yes. That division we accept as the result of circumstances that were in existence before the department was established at Aberystwyth.

8197. Do you do much work in these affiliated counties ? It will facilitate your answer if you look at the Board of Agriculture Report. (*Handing same.*) I see there is practically nothing in Breconshire ?—Breconshire, I think, has never contributed more than £100 a year to agricultural education.

8198. Then you feel no obligation to a county unless that county makes a substantial contribution to you ?—No, there is no obligation ; that is, we have no right to enter the county except as we are called in by the local authority to do certain work.

8199. Are you not, as a collegiate centre, holding yourself out as more or less responsible for the agricultural education of that area ?—Certainly ; that is part of the duties assigned to us by our Charter, to promote agricultural and technical education.

8200. That is what I understood. In so far as you exist as a collegiate centre we in England look to you to make yourself responsible for the counties affiliated to you ?—Yes, absolutely so.

8201. Now, if you will look at Cardiganshire, that comes next—it is on page 177 ?—Yes.

8202. I do not think there is anything done in Cardiganshire ?—On the contrary, there is a very great deal of work done in Cardiganshire.

8203. Of what nature ?—Cardiganshire is, I think, one of the best organised counties in Wales for this purpose. The work we have done there has been in the nature of local lectures, extension lectures in agriculture and in horticulture, in the form of scholarships given to young farmers to attend the short courses, and to the daughters of farmers to attend the advanced dairy school.

8204. In other words, a good many of your short course students come from Cardiganshire ?—A good number.

8205. But you have no classes in the county itself on any of these subjects contained in this list ?—We have the local extension classes simply.

8206. How is it they are not described here ? Page 157 begins at dairying, and down to the training of elementary school teachers it is a complete blank ?—To take the training of elementary school teachers, for example, there are always courses at the College in the summer for teachers, and they are attended chiefly by teachers from Cardiganshire, I should say.

8207. Have you any idea who furnished this report ?—I could not say.

8208. Because this must be obviously inaccurate ?—Our College reports each year which are sent to the county authorities would show at once that there is a very great deal of work done in Cardiganshire under several of those heads, and the same is true of Carmarthenshire. In the other counties the work done is much less because the grant given in each case is small. In Breconshire it has not been more than £100 in any year, so that the work we do in the county is limited to the work that can be done for such a small grant as that.

8209. I am very glad indeed to find that there is more work done than would appear from this Report. My object is to see whether you cannot annually draw up a scheme for the whole of this area dealing with varying grades of education in agriculture ?—I should certainly think that that could be done. Our present plan is to send to the County Councils at a certain time of the year in April or May a list of the types of work that we are prepared to carry on. Then they reply to us some time before June or July possibly in some cases, stating for how much work and under what heads they are prepared to give grants.

8210. They apply to you if they want any particular kind of lectures or any particular kind of instruction ?—Yes.

8211. But one cannot help feeling that a meeting held annually to discuss the particular requirements of each county, the facilities that each county offers, and then to tabulate, if you can, regular grades of education from the elementary school upwards, working finally to your College at Aberystwyth, would be desirable ?—Yes.

8212. What one feels is this, is it not, that in the majority of cases nothing is done between the elementary school and such an institution as yours ; there are occasional lectures, and there are some field experiments, but for the lads of 16 or 17 practically little is done ; there is nothing in the nature of intermediate education ?—I may say that the question of making the intermediate education more directly useful to agriculture and to farmers is engaging a good deal of attention in some of our counties at the present time, and the question is being carefully considered whether it is advisable in the upper standards of the intermediate schools to introduce some specific instruction in agriculture or in direct agricultural subjects.

8213. Probably you would not find that succeed, but it might be possible to organise an intermediate school as good as your other intermediate schools which would be devoted entirely to agriculture ?—Yes ; that is one of the alternative plans suggested, I may say, for meeting the problem.

8214. That is under consideration ?—Yes, in the various counties.

8215. There has been a proposal of the kind at St. Asaph, I think ?—Yes, I have heard of such a proposal.

8216. Do you not agree with me that your institute as an institute of the highest grade would fulfil a more useful function if it did provide for all these varying classes, that is to say, give them permanent institutions and not provide them merely with spasmodic lectures ?—Yes, undoubtedly it would be if the provision were made more continuous and systematic and extended from the elementary schools by a well-considered plan up to the university.

8217. It is a question which is already under consideration, and one which I hope you will consider more fully ?—The further development of the work that we have done in the counties is a matter that will receive the very fullest consideration. I may say that I have not entered into it because I do not think it is wise that I should do so, seeing that a new professor has been appointed who is about to enter upon his work, but I can assure the Committee that that is one of the principal matters that will engage the attention of the College.

8218. You mentioned, of course, your desire for further financial aid. Do not you think that you would establish your claim upon the country if you could provide and maintain these varying grades of institution ?—Yes, I think there are two main grounds upon which our claim for aid is based. First of all, the provision of the highest instruction and the development of investigation, and secondly the development of a system of agricultural education under the guidance of the College for the whole of this particular area, and the making of the College a central intelligence bureau for all questions in the area relating to scientific agriculture.

8219. That is exactly what I mean, and of course you are already doing something with regard to the training

of elementary school teachers?—We are. We have a large day training department connected with the College.

8220. I meant rather the training of elementary teachers in rural subjects?—Yes, we are already doing something in that direction, and I believe that in future we shall do a great deal more.

8221. That is capable of extension?—That is capable of great extension.

8222. (*By Mr. Latham.*) I do not think anyone has asked you to tell us what you do in horticulture?—In horticulture we have an instructor, a very capable man, who devotes the whole of his time to the work, and who lectures and conducts demonstrations at village centres in the various counties, and when he lectures in the district he spends a considerable part of his time in the elementary school. He shows the teachers where to establish school gardens, and interests them in nature study and so on, and in that way he has done undoubtedly an immense amount of valuable work during the past seven or eight years. The difficulty so far has been that the county authorities have not seen their way to establish school gardens in connection with the schools. The lecturer has been urging that upon them, and he has issued a list which he has sent to the county authorities of schools which are suitable for an experiment to be made in that direction because the head teachers are keenly interested in the subject. Up to the present time, however, the county authorities have not taken actual steps; but although the school gardens are not established upon an organised plan a very great deal of work is being done in the elementary schools as the result of the instruction given by this instructor to whom I am referring.

8223. Is any portion of this farm set on one side for tree planting and that sort of thing?—There is a portion of the farm that is set apart for a large garden, and I may say we have also, on another piece of ground, which belongs to the College, an orchard. I do not know whether we shall continue that; we may, now that we have got a farm, concentrate that work in the College farm, but when the orchard was formed there were about 500 trees laid down in it, and they were laid down by the students then in attendance, and by schoolmasters who were attending a short course in horticulture in the College at the time. That shows you the kind of beginning that we have made in that direction.

8224. Are there any scholarships covering maintenance? Do they lodge in the College or do they go backwards and forwards to their homes? Is there any hostel?—The men students are in lodgings entirely; there is no hostel applying to the agricultural men students. The young women who attend the advanced dairy school remain in one house, where they are under the supervision of the instructress.

8225. That would be a hostel or something of that sort?—A sort of hostel.

8226. That is to say, they are all under superintendence?—The young women in that way are under superintendence while they are in the College.

8227. (*By Professor Middleton.*) You referred incidentally to your degree course being adapted for training agricultural experts; it is not really intended for farmers and land agents so much as for the agricultural chemist and the agricultural botanist, and so on?—Principally for those.

8228. What length of time is occupied in the degree course as a rule?—The minimum course is three years.

8229. What amount of science enters into this course for the degree in agriculture?—A very considerable amount. I should say between half and two-thirds consists in pure science, theoretical and practical science.

8230. I see on looking at the calendar that you require a student to take the final courses in no less than three subjects?—In three subjects.

8231. At least three subjects?—Yes.

8232. Two of them must be pure science subjects?—Yes, two of them are pure science subjects.

8233. In comparing this course with some of the other courses for a degree, it seems to me you require more work from the agricultural student than you do from students in some of the other divisions?—The student who takes the ordinary B.Sc. may take, for instance, physics and chemistry; he must take two branches, physics, *plus* inorganic and organic chemistry.

8234. So that the agricultural student would take in the place of physics a subject which you call agricultural

science?—He would. We have tried to introduce into the degree a really high standard of scientific training.

8235. (*By Lord Barnard.*) I suppose your school is open to the whole world, and is not limited to Welshmen?—It is not limited at all.

8236. Do you have any students from other parts of England?—We have. We have about 100 students from England at the present time out of our total of about 450 students.

8237. You have about 450 students?—About four hundred and fifty regular students; the present number is 429.

8238. Do they live in lodgings or in hostels?—The men students live in lodgings, and the women students live in a hostel called Alexandra Hall.

8239. Do outside students pay higher fees than Welsh students?—No, they pay precisely the same fees. The fees are quoted in the Calendar of the College which I have put in.

8240. Do you keep a separate account of the receipts and expenses in connection with your agricultural farm?—We do. The Farm Report shows the balance-sheet of the farm and the Calendar that of the department.

8241. It is entirely under the control of this committee which you have already spoken of?—The Agricultural Committee to which I referred is not the Executive Committee of the Agricultural Department.

8242. Then who manages the agricultural department?—That committee is a consultative committee which meets some four or five times a year. The actual executive committee in the hands of which the management of the agricultural department rests is the Council of the College. The Council therefore is largely representative of these seven counties. We make it our aim to get representatives of each of the seven counties to be members of the Council.

8243. What I want to ascertain is this, whether the County Councils are perfectly familiar through their representatives, or through somebody or another, with the finance and everything connected with it?—Yes, I believe they are familiar with it.

8244. They have a voice in the management?—They have a voice in the management, and I might add that the farm is managed by a committee directly representative of the County Councils.

8245. Have you any experience or strong opinions on the subject of the training of elementary school teachers?—I have formed a general opinion.

8246. Do you have many of them at your College?—Yes, we have a large training department there.

8247. It has been suggested to this Committee that it would be very desirable if the training of elementary school teachers included, particularly in the case of those who are going to become teachers in rural districts—which I suppose would be very largely the case in Wales?—Undoubtedly.

8248. —Rural subjects or subjects connected with rural life. Do you think that is practicable?—I think it is practicable to a considerable extent that the model lessons that they give during their course of training should be made to bear largely upon rural subjects, but I think the object has to be promoted chiefly through the scientific training that is given to the students. Speaking in reference to our own College, for example, we require that all students received into the training department should matriculate in the University of Wales before they enter; that means that they are students fully qualified to pursue a full course of study for a degree, and a considerable number of them qualify for the degree of Bachelor of Science. Those students spend the great bulk of their time upon scientific study, theoretical and practical, and I think the general discipline that they get in that way makes them qualified in the best sense to introduce into the school work, when they enter into their work as teachers, a very large amount of attention to rural subjects. On the other hand, a large number of the students prepare for the degree of B.A., which means a degree containing subjects of language, history and literature, and it is for these students that I think a very considerable amount of nature study, information in regard to subjects such as horticulture and other subjects bearing upon agriculture, should be introduced during their course of training as part of the training they receive in the art of teaching.

Mr. T. F.
Roberts.

13 June, 1907

Mr. HENRY JONES-DAVIES, called and examined.

Mr. H.
Jones-Davies
13 June, 1907

8249. (By Lord Barnard.) You were formerly Chairman of the Carmarthenshire County Council, and you are also ex-Chairman of its County Education Committee?—Yes.

8250. How long is it since you held those offices?—I was Chairman of the County Council in the year 1902 and Chairman of the Education Committee last year.

8251. Only for one year?—No; I was Chairman of the Education Committee for two years.

8252. Are you an agriculturist yourself—have you a farm?—Yes, I have a farm of 75 acres, a freehold farm.

8253. You come into contact with farmers?—Yes, with every class of farmer in the county of Carmarthen.

8254. What is the opinion of the farmers in the county of Carmarthen as to the work which has been done by the University College of Wales?—They look upon it very favourably.

8255. Have they done that from the beginning or were they at all sceptical at first?—I think perhaps if I might be allowed to read my statement, it would answer that.

8256. By all means.—I will summarise it as much as possible.

8256a The starting-point of higher agricultural education in the county is traced to the passing of the Technical Instruction Act, 1889. The Technical Instruction Act gave the farmer the first opportunity. Until the passing of that Act and the Welsh Intermediate Education Act, the facilities for obtaining agricultural education were very meagre indeed, not to say inadequate. The resources of the farming community and the nature of the provision were such that they were wholly confined to the upper and middle classes. The Acts cited threw open the floodgates to agricultural education, which have by this time swept away many a prejudicial barrier.

Wales could not lay claim to any facilities in this respect except over the border and beyond the reach of the Welsh farmer, should he feel disposed to gain that knowledge. The Technical Instruction Acts gave him the first real opportunity. Prior to this the only opportunities he had of enlarging his knowledge, except by his own minute observations, were those scantily afforded by shows, farmers' clubs, competitions, in connection with some agricultural society, and more often by copying some system adopted by the most enlightened and progressive agriculturist in the neighbourhood. Many an enterprising farmer has been a benefactor to his locality and pioneers of agriculture in their respective districts, whom the whole countryside had full confidence in, and whose progressive methods they readily adopted.

8256b Though the Technical Instruction Act was passed in 1889 the first rate of 1d. in the £ was not levied till the financial year 1891-2. In 1892, I think, we first had the benefit of the guidance of the Aberystwyth College authorities. Extension lectures were delivered and travelling dairy schools established. These were the heralding of a new era of higher instruction in agriculture brought to the home and everyday life of the farmer. The lectures were, and are still delivered, in the vernacular. The lectures and dairy schools were well attended, not perhaps for the sake of the instruction given, but in the main for the curiosity of hearing how farming was to be made more remunerative by a college professor. The large majority did not take kindly to the new gospel. Some meditated and reflected. Reflections thus started soon landed them in more open-mindedness, with the result of giving a fair trial to the suggestions of the lecturer.

8256c Travelling dairy schools were inaugurated about the same time. Plenty of pupils were forthcoming. In some cases those that were prepared to continue the new practice would not be allowed to carry out what they had accomplished at the school on account of the unexampled fidelity to old customs and traditions at home. Travelling dairy schools have been most popular in the county, being located in some centres for even six or eight weeks. About 1,200 pupils have passed through these schools and 88 per cent. have gained certificates.

8256d Then in the year 1893, 12 scholarships, the result of the systematic instruction now afforded at the College, were awarded for an advanced course in dairying for six weeks and distributed throughout the county according to unions. Thus they have been distributed to this day so

that every part of the county gets its quota. The number of scholarships have subsequent to this been increased to 18 but again reduced to the original number, as well as extension lectures and travelling dairy schools, on account of financial considerations.

The applicants for dairy scholarships increased from year to year until in one year there were as many as 140 applicants. Two scholarships are in turn offered to the best two pupils in the advanced course to proceed to the diploma course.

In 1896, 12 young men were selected for the short courses for farmers' sons who intended to follow the pursuits of agriculture and were afterwards increased to 18 per year and now reduced to 12, the two best in each batch being allowed to proceed for the advanced course. Should there be a candidate of outstanding merit and of restricted means, the Education Committee is ready to assist him for the diploma course.

8256e But to-day there is not a corner of the county that you will not find a number of young men and women who have had this training in agriculture. Undeveloped resources and intellect have been tapped. The results from those students may not yet be fully appreciated by the ordinary onlooker, for in many instances after their return home their parents may be averse to new notions, through being prejudiced. It gives them an insight to a larger sphere by coming in contact with pupils from other counties with other views, manners and customs. They are thus able to obtain a glimpse far outside their usual environment. They become permeated with a desire and a yearning for more learning and culture and to take a pride in their avocation. It is working a silent revolution. Anyone with a prophetic eye will grasp the import of the situation and be assured that it must act beneficially with the coming generation of farmers. Through their little training they have been shewn how useful is the knowledge received, and in the upbringing of their families, they will take care that their children shall not be handicapped as they were through lack of instruction. That is a foundation for the future of agricultural education. There will be an alert and an enlightened public opinion on education and its functions in regard to agricultural and rural life. It will be a great advantage in moulding the character of those who will in time take their share in the keen and severe struggle of modern agricultural life.

It has given them a new hope, a new interest and a new knowledge.

8256f Then, with regard to the analyses of feeding stuffs, manures, soils and seeds, under the Fertilisers and Feeding-Substances Act of 1893, the County Council came to an understanding with Aberystwyth College to pay half the fee and the sender of the sample the other half.

8257. I do not think you need trouble with regard to the Fertilisers and Feeding Substances Act except, I will just ask you very shortly, the College has arranged to do work under the Act, as Principal Roberts has told us?—Yes.

8258. Some reference was made by Mr. Latham in asking questions of Principal Roberts as to large farmers. I fancy large farmers are very rare in Wales?—Very rare in Carmarthenshire and Wales generally. I think, according to the last report, the average is 50 acres.

8259. Yes, there are 3,000 holdings between 50 and 300 acres, and only 57 farmers in the County of Carmarthen of over 300 acres. Of course we must not confuse farmers in Wales with large farmers in the Midland counties in England, for example?—No; and the conditions also are totally dissimilar.

8260. A very large number of the farmers also are what are called working farmers, that is to say they work on their farms themselves a great deal—they and their families?—They do.

8261. There is not a large number of farm labourers, I presume?—Of course we have a large number of small holders of from five up to 10 acres; they would have some subsidiary occupation as well.

8262. Where does the Welsh farmer send his boys to be educated?—First to the elementary school. Some send them to the intermediate school. They receive bursaries under the intermediate education system in Wales, but we

have many instances of scholarships to the short courses at the College, young men and women.

8263. If a farmer wishes his son to have special instruction he sends him to Aberystwyth?—He does; we have practically covered the county.

8264. By means of scholarships given by the County Council?—Yes.

8265. You have, in your opinion, dealt with the subject satisfactorily in Carmarthen?—Yes, because we have distributed the scholarships so many for each union, so that every part of the county should have its share, and we have made no discrimination between the sons of small farmers and the sons of large farmers.

8266. At what age do these boys go for the short courses?—They are not allowed to go under 16.

8267. Before that age they have probably been working for their fathers on their farms?—Yes, after leaving the elementary school.

8268. You consider that a good plan?—Yes, but there should be some means of instruction so that the gap between 13 and 16 should be filled.

8269. You have something to say on the subject of instruction in horticulture?—Yes. Horticulture, which may be taken as a subsidiary branch of agriculture, has been provided for. Lectures are delivered in horticulture at various centres throughout the county. Applications were sent in by the parish councils and so many allotted to each union. The lectures are very popular and well attended. Short course scholarships, varying from 10 to 20 in number, are offered to elementary teachers, subject to their teaching horticulture as a grant-earning subject. This course has given a great impetus to school gardens and nature study. I have brought with me here specimens of the posters that we exhibit throughout the county asking if there are any applications for these courses and scholarships. (*Handing same in*).

8270. Have any elementary school gardens been established?—Only one has been established in the county, but there are instances of this kind, that where the house and garden are attached to the school, the teacher generally takes the pupils to his own garden and does nature study. I can give you an instance which was brought about simply through this method of giving lectures in horticulture in the county. One elementary school teacher at Llandarrog, a centre which was visited some years ago, told me the other day that before we had this system of horticultural instruction in the county he took no interest in horticulture or nature study, but that now he had taken it up, and last year, he further told me, his children collected no less than 350 different plants and wild flowers, and so forth, in the nature study line.

8271. Next you mention experimental plots and the experimental farm?—Yes. Experiments are carried on over the affiliated counties for years on different crops and the results tabulated, printed and circulated. They create a large amount of interest and are undoubtedly most useful in their particular districts. In 1901 I addressed the Carmarthenshire Chamber of Agriculture on "Agricultural Education" and suggested the establishment of an experimental farm for the counties of Carmarthen, Cardigan and Pembroke. At the end of the discussion, it was unanimously resolved to petition the three county authorities to institute such a farm. Soon afterwards a conference of counties affiliated was convened at Aberystwyth College, and it was there agreed to establish such a farm suitable to the peculiar needs and conditions obtaining in the counties. The several counties, with the exception of Pembrokeshire, have joined. It is essential that the experimental farm and laboratory should be in close proximity. The local plot is more required now with the establishment of the experimental farm than before in order to test conclusions arrived at, at the central station, and the effect of the prevailing local conditions on them. One is necessary to the other.

8272. Are you yourself one of the managers of the farm?—I am a member of the College Council, and a member of the Agricultural Committee, and a representative of the County Council on the Farm Committee.

8273. Do you go to the farm frequently yourself?—Yes, I have been there three or four times since its establishment.

8274. How far is it situated from the College?—That is the disadvantage, if anything; communication between different places is not easy of access. Carmarthen would be 50 miles from Aberystwyth.

8275. Do you mean the farm is 50 miles from the College?—No, I was speaking of the County of Carmarthen. I should say the farm is two to two-and-a-half miles from the College.

8276. Do farmers visit the farm?—Yes, parties of farmers visit the farm, especially at show time, but on other occasions as well.

8277. Do you ever hear the farm being talked about when you are at home?—Yes, a good deal; they take a great deal of interest in it.

8278. You consider it of great value?—Yes. No doubt they take more interest in the farm and in the College because there is hardly a farmer in Carmarthenshire whose son or daughter has not been through the short course.

8279. It is your opinion that, in addition to that experimental farm, local experimental plots are very desirable?—Yes, to carry out experiments in these local places.

8280. On the subject of co-operation I think we will hardly trouble you to read the whole of this statement, because Principal Roberts has already told us something about it. Perhaps you will tell us what the present position is with regard to co-operation?—When the County Councils of Carmarthen, Cardigan and Pembroke, and also the College Council appointed in 1902 delegates to enquire and report on the agricultural co-operative movement in Ireland I was appointed the honorary secretary of the deputation for the three counties. I have a copy of their report here. I was afterwards chairman of the society that we started soon after our visit to Ireland and seeing the work of the movement there. We started with about 80 members, and in the course of about a month or two we saw that we could carry it on successfully. At that time there was a large number of farmers who were sitting on the fence really waiting to see how it turned out and they have mostly come in, and to-day we have 400 members all taking an active interest in it, and all drawn from a radius of six or seven miles from the centre of Carmarthen. The turnover for the first year amounted to £5,000, it was a little over £11,000 the year after, last year we reached a total of over £18,000, and still we are increasing again this year. We have made all our arrangements to open another centre in the course of a month or two some nine miles away in a district which is quite as good as the Carmarthen district.

8281. These societies are not financed or assisted in any way by the Councils, are they?—Not in any way at all.

8282. Are they assisted in any way by the College at Aberystwyth?—I think lectures on co-operation have been delivered at the college since that visit to Ireland—as the result of it. I may say the students who have been through the short course at Aberystwyth are our recruiting ground.

8283. (*By Lord Moreton.*) Does the College help you at all as regards the analyses of cakes, feeding stuffs and manures?—Yes. Under the old Act the arrangement between the College and the Council used to be that the sender of the sample was to pay half the fee to the College for the analysis and the County Council the other half. Very few samples were taken under that arrangement, so the County Council resolved to give the analyses free and make an annual grant towards the College laboratory. The result was that an average of 40 samples were sent up every year throughout the county. Under the new Act we have made further arrangements with the College.

8284. (*By Lord Barnard.*) With regard to the subject of county lectures, you say you are of opinion that the time has arrived when there should be an agricultural lecturer and expert for every county. Those are two separate duties, are they not?—The lecturer would have to be an expert to a great extent.

8285. You would not agree with some of the witnesses who have been here and who consider, except for the purpose of stimulating an interest in the first instance, that lectures are not really of very great permanent good. I suppose you mean peripatetic lectures?—Yes, and lectures that would enlist sympathy with agriculture in the county and excite interest in it as much as possible, and the lecturer could make arrangements with regard to experimental plots and demonstrations, and could give lectures on them in the winter evenings afterwards. Ours is a larger county than any of the others that are affiliated, and that is why I make the suggestion so far as our county is concerned.

8286. Do you suggest that this lecturer should be an official of the County Council exclusively, or that he should be connected with the College?—Connected with the central institution, the College, by all means.

Mr. H
Jones Davies.
13 June, 1907.

Mr. H.
Jones-Davies
13 June, 1907

8287. What is your view with regard to intermediate schools and agricultural instruction?—There is very little done as regards agricultural instruction under our intermediate education system so far in the county of Carmarthenshire, and there are two or three intermediate schools situated in typically agricultural districts. Very little is done as regards agricultural teaching in them, and what I suggest is that one of these intermediate schools should specialise in agriculture, so that a farmer might know if his son was going on the land that there was an intermediate school where he would get that special training, and such a school would thereby become a feeder for the Agricultural College at Aberystwyth for those who wanted to pursue the higher branches.

8288. Am I right in thinking that there is a Central Board of Education for Wales?—Yes; I am a member of that Board.

8289. So that you might press your views on that Board?—Yes, that is so, and they have it under consideration to a certain extent, but a great deal of the arrangements are in the hands of the local managers of the schools who are not under the control of the central authority.

8290. You think evening continuation schools require development, and that something in the direction of providing agricultural teaching in those schools might be done?—Yes, there is very little work of that kind done in the rural districts; in the mining districts they take on much better.

8291. The population is greater probably in the mining districts?—Yes.

8292. Is not one difficulty of the evening class in a sparse district the long distance for young people to come be an evening?—Yes, in the rural districts; they can be more easily organised in the populous districts.

8293. In spite of that you think it would be an advantage?—Undoubtedly, because those that are now held in the rural districts really do not take up an agricultural line in their mode of instruction.

8294. You have some notes on the subject of rates?—Yes, that question has affected agricultural education very much in our county lately.

8295. You may as well tell us perhaps in what way it has affected agriculture?—In this respect. The high water mark of agricultural instruction was the year 1902-3, when the new Education Act came into force. At that time we levied a penny rate, which was not levied anywhere else in Wales for technical instruction. We spent over £1,000 for agricultural education. I have the syllabuses for that year and the technical grants made last year, if you care to see them.

8296. The evidence you have written down here is practically the same as we have got from all over England, that is to say that since the Act of 1902 the County Councils have had far less funds at their disposal for such a subject as agricultural instruction?—That is so. We have still the ordinary rate, but more than that goes towards the training of elementary teachers. I have the financial statement of the pupil teacher instruction in the county for last year. (*Handing document.*)

8297. I see in this poster which you handed in that you offer 18 short course scholarships of £10 each open to farmers' sons and tenable at the University College. Are all those 18 taken up?—They are reduced to 12 now, because of these financial considerations..

8298. They were reduced in 1906 to 12?—Yes, and so they are this year. We have allocated the technical grants a month ago; we do it at the commencement of the financial year.

8299. (*By Lord Moreton.*) Can you give us any idea as to the character of the stock and the method of cultivation generally on the College farm?—They have Short-horns there and black Welsh cattle—two varieties of Welsh black cattle, Castle-Martin and North Wales, cattle that are typical of the stock kept in the affiliated counties.

8300. They do not confine themselves to any one particular breed, or any one particular locality?—No, they do not; they try and assimilate the farm as far as possible according to the conditions of the affiliated counties.

8301. The same applies to sheep, I suppose?—Yes.

8302. You have different varieties?—Yes, Shropshire and Welsh mountain.

8303. The stock is varied?—Yes.

8304. (*By Mr. Latham.*) Kindly explain what you mean by saying that the idea, on the part of those who

attended the lectures and dairy school, was more out of curiosity than to see what could be learnt by agricultural education?—They had no understanding of agricultural education in the county before, so they simply came at first, a number of them, out of curiosity to see what was going on.

8305. Was it necessary to go to the dairy schools for that purpose? Was there no other chance of meeting any educational authority except dairy schools?—Not at that time in the way of agricultural education in the county.

8306. Did the instructress at the dairy school lecture on anything else except dairy work?—The instructresses were supplied by the College at Aberystwyth. There were instructresses appointed at Aberystwyth College, and the County Council of each different county then applied for a course of lectures to the College and the College sent the instructresses to each county.

8307. Were the attendants at the lectures male or females?—Nearly all females—I do not think I have heard of a male.

8308. The interest in these dairy schools became so great that they were eventually attended by a very large number of pupils?—That is so.

8309. I do not understand your definition of this. You say: "The lectures and dairy schools were well attended, not perhaps for the sake of the instruction given, but, in the main, for the curiosity of hearing how farming was to be made more remunerative by the college professor."—That was at the commencement, but afterwards they took a different view of it. After they had seen the instruction and how it was being worked they took a different view of the affair altogether.

8310. Did they go in the first place to criticise?—Yes, to a very large extent.

8311. They were not very favourably inclined?—No, of course they were prejudiced in going there.

8312. I take it they did not go so much to get agricultural education as to smile and ridicule?—That was so perhaps, for the first year or so.

8313. But now they attend in very large numbers?—Yes, things took a different complexion.

8314. They have attended in very large numbers and are perfectly satisfied with the results of the education given?—Yes.

8315. You spoke of having a membership of your co-operative association of 400 farmers who were drawn from a very little circle?—From a radius of six miles or so.

8316. What must have been their occupation—400 farmers drawn from within six miles?—It embraces every class of farmer. The majority of them would be holders of 50 acres or so, and we should have some agricultural labourers, members, but nearly every agricultural labourer in Wales, except those who are at the farmers' board and expense, have a little land which they work casually themselves.

8317. That is how you get the 400 men in the very small space of six miles?—Yes.

8318. Were the lectures that were given in the county through the College all on agriculture?—All on agricultural subjects.

8319. Were they new subjects?—Quite new.

8320. That is to say, before you had these lectures introduced amongst you you knew very little of agriculture except just the native agriculture?—There was practically nothing in the way of agricultural instruction then.

8321. It has been taken great advantage of?—Great advantage has been taken of it.

8322. Do you consider the Principality is making much greater profits by this superior education? Are you making more profits on your farm because you have got a very superior education—is the land producing more since you have had this agricultural education?—No doubt the land is producing more, and another thing, if it was not for this instruction they would not be able to meet the requirements of the markets to the extent they do now. Take butter making, for example.

8323. Do you consider that the butter that is being made in the district at the present time is of a greater value than it was before?—It has improved in quality.

8324. What would be about the price that you are receiving for your butter now?—The price now would be about 10½d. to 11d. a lb.

8325. What was it before?—That depends on the fluctuations of the markets. Some eight or nine years ago I remember it went as low as 7½d. to 8d. in the summer time, but that was an exceptional year.

8326. You spoke just now about the Fertilisers and Feeding Stuffs Act. Does the college carry out analyses for nothing?—They do not. We give them an annual contribution under the old Act, but under the new Act the official sampler takes the samples now.

8327. That is not quite what I mean. The help comes from the County Council. The college were paid for their work?—They were.

8328. I presume the young men who are leaving the elementary schools do require some great stimulus before they can be got to go on to the College. You want something between the elementary schools and the life they are supposed to lead at the college and the education they are likely to get there?—Yes, but the majority of our young farmers go to the intermediate schools from the elementary. We shall find in the course of the next three or four years, I daresay, that the great majority of these young farmers will have been through the intermediate schools.

8329. Are those the schools that the 1902 Act is supposed to be taking up at the present time?—No, those intermediate schools came into existence in 1889. That is by the special Welsh Intermediate Education Act. Wales had a special Act of its own. They are not allowed to be at those schools over 18 years of age; they generally go from the elementary to the intermediate.

8330. At what age do they leave the intermediate?—They generally leave at the age of 15 or 16.

8331. At what age do they take them at the College?—16 is the limit. We do not allow them under 16.

8332. I want to know what they do between the time they leave the intermediate school and the college?—Farming as a rule.

8333. Is it a very great advantage that they should not go to the college until they have had some idea of the life on the land?—Yes, they ought to have some idea of the life on the land, but you will find the farmers' sons who attend the elementary schools often, during the time they attend the elementary schools, do a great deal of farm work on their fathers' farms before they go to school in the mornings and after they leave school in the evenings.

8334. Are the majority of these lads in the elementary schools working with their parents and helping them to carry on their occupation?—Yes, a very large number of them.

8335. (*By Professor Middleton.*) Which department of the work of the College has done most for you in Carmarthenshire? Would you consider you have got more from the local lectures or from the short courses or from the experimental farm? Which do you think is the most valuable work?—The short courses, I think. We have taken the future into consideration as well.

8336. Your county has had from 12 to 18 students in a year at that short course. Since when?—In 1893 we commenced the young women and in 1898 we commenced the young men.

8337. So that you have now in the county of Carmarthenshire a very large number of young men who have been to the short course?—Yes, you can hardly go to any part of the county without coming in contact with them.

8338. Have you noticed in the county of Carmarthenshire whether these young men who have been to the short course are shaping better and are likely to make better farmers than those who have stayed at home?—Yes, they have more advanced views than those at home.

8339. You think the seven or eight weeks they have had at Aberystwyth has had a distinct effect upon them and that it will influence their farming?—Yes, it is a great stimulus in influencing their farming.

8340. (*By Mr. Medd.*) What is the length of the short course?—Six or seven weeks.

8341. What time of year?—It used to be in October.

8342. From October till December?—Yes.

8343. Have you ever thought of extending it during the winter months?—Of course we have the continuation short course.

8344. What is the continuation short course?—For the two best pupils in the short course; they are then allowed to proceed for the advanced course.

8345. How many would there be in that?—There will

be 12 sent up this year and scholarships are offered for the continuation course of 16 weeks for the two best students.

8346. What is their average age?—They range from 16 up to 23.

8347. Do they as a rule come to you direct from the intermediate school or do they come from off the land?—Most of them now have been at intermediate schools before we have selected them for these scholarships.

8348. What proportion come off the land?—They have all been in contact with the land; they must be farmers' sons.

8349. How many have been actually farming?—Doing work on the land?

8350. Yes?—They have all done work on the land.

8351. When do they leave the intermediate school?—When they leave the intermediate school they go on to the land then.

8352. You mean they are combining school life and farm life?—When they are taking the short course of course they cannot return home at nights, but while they are at the intermediate school they can, and they go on the farm, and, as soon as they leave the short course at the College, they work on the land again.

8353. Can you tell us what effect the college farm has had upon the neighbourhood?—I cannot speak of the immediate neighbourhood because I am so far away from the farm.

8354. When I was there Mr. Williams gave me several striking instances, especially with regard to the great improvement that had taken place in sheep?—Yes.

8355. That has not come within your knowledge?—No, I have not noticed that so far.

8356. You were mentioning to Lord Barnard about the intermediate schools?—Yes.

8357. What is it exactly that you propose to do?—What I propose to do is to take, for instance, our county, Carmarthenshire, where we have three, I think, intermediate schools situated in purely agricultural centres, I propose that one of those schools should specialise in agriculture, so that a farmer whose son was going in for farming could send his son there, where he would receive a special education in agriculture.

8358. You do not propose to combine agricultural teaching there with general education?—No, I do not think it would be quite so successful.

8359. It would not, undoubtedly.—No.

8360. If you were to have an intermediate agricultural school it must be a specific agricultural school.—Yes.

8361. And not attempt to cater for two distinct classes?—No, quite by itself. I think there would be plenty of pupils forthcoming for that school in the county alone.

8362. At what age would you propose to take them—from thirteen?—As soon as they leave the elementary for the intermediate.

8363. From 13 to 14 up to the age of 17 or 18, I suppose?—Yes, say 17 or 18.

8364. Would you advise your course to be complete in itself, and, although of an intermediate grade, not necessarily leading to Aberystwyth?—It would be a benefit of course for those going in for the higher branches that they should proceed to Aberystwyth.

8365. Quite so, but of course there are a certain number of lads in every county who could not prolong their education beyond the age of 17 or 18?—Not unless they were assisted by the County Education authority.

8366. Yes, and even if they were assisted it might be desirable that they should begin earning their living at the age of 17 or 18?—Yes.

8367. In other words your aim would be to pass on your best pupils, by the aid of scholarships or otherwise, to Aberystwyth?—Yes.

8368. But that for the ruck, for the ordinary pupil, you would assume that the boy's education would finish at the age of 17 or 18?—The ordinary one would, yes.

8369. You would endeavour, in organising a school of this kind, to make it as practical as possible?—Yes. I would suggest that there should be some land attached to it, and that we should have the practical side as well as the theoretical side.

8370. In developing it you would develop it rather upon

Mr. H.
Jones-Davies.
13 June, 1907

Mr. H.
Jones-Davies.
13 June, 1907

the practical than upon the scientific side?—Yes, because if they wanted to proceed for the scientific side they could get that at Aberystwyth where the laboratories are.

8371. For that grade of student the practical side is more important than the scientific side?—Yes, at the intermediate.

8372. I sincerely hope you will succeed in establishing a school of that type. We want them very badly in England, and you have given us the lead in so many ways in Wales that I hope you will succeed in that respect too. —I made that suggestion the other day at a meeting of the Carmarthenshire Chamber of Agriculture, and it was well received.

8373. I trust you will succeed in it.—I hope so.

8374. (*By Mr. Davies.*) I think, in answer to Mr. Latham, you told us you considered it essential that those young men before they go up to college should have some practical knowledge of the work of a farm?—They have that knowledge owing to the conditions now prevailing at home.

8375. Do you consider that should be a condition before they enter the College? There are a certain number of young men who as you know come up for these courses, and more especially for the diploma course, who have had no knowledge of farm work before they enter the College? —We select those young men who are likely to benefit by this mode of instruction. The members of the Education Committee as a rule know every applicant that applies for these scholarships.

8376. I am not speaking so much about the scholarships now, but more from the point of view of the College. Do you think the College should lay down a condition that every student that entered the agricultural department should have had some previous practical experience of a farm as an essential principle?—That would be of great assistance, no doubt.

8377. With regard to your scholarships, as far as I can make out from the Board of Agriculture's Report, in the year 1905-6 there were only £60 allotted the scholarships from Carmarthenshire. I understood you to say in answer to Lord Barnard that there were at least 12 scholarships granted?—Yes, there were 12 for young men of the value of £10 each, and 12 for young women of £12 each. I do not understand the £60, unless it is for horticulture.

8378. No, horticulture is £176?—That includes the scholarship for elementary teachers as well.

8379. Perhaps you will tell the Committee how these scholarships are awarded. Is there any examination?—No, there is no examination.

8380. How does the County Council proceed to allot the scholarships?—Say, for instance, we have 30 applicants for 12 scholarships we generally allot so many for each union according to the agricultural value of that union, and then we proceed to elect the candidates, and it is always understood that a candidate who has been unsuccessful the year before should have priority the year after.

8381. So that it is really not a question of money. The young man may not have passed any examination at all, and may not have come from an intermediate school, but so long as he sends in his application he is almost certain of getting a scholarship?—There is no test in that way.

8382. Do not you think it would be desirable to have a test?—I do not think so. I will give you an instance of a young woman who had only been to an elementary school. She had had no training beyond the fifth standard. She won one of the two scholarships offered to the two best students in the advanced short-course at Aberystwyth. She was very backward in the theoretical part, but she was helped so far on in the practical that she obtained almost the maximum marks, and was the second best in our county. She pursued that course, and she has been so successful since that she has been appointed lecturer there, and she also won two first prizes in the butter-making competitions at the London Dairy Show.

8383. You prefer the system of allotting scholarships without any test whatever?—Yes, because we could not test them in all cases; some have advantages, others have not.

8384. Does not it very often happen that farmers who can afford to send their sons to these colleges are granted scholarships, and the smaller farmers who perhaps cannot afford so well to send their sons turn round and say: "These men who can afford to send their sons are given scholarships and we are not given any, and therefore we will not have anything to do with the College," and their interest in agricultural education evaporates?—We do find the

feeling which you have just touched upon obtaining in the county. We have tried really not to grant the scholarships to the children of large and well-to-do farmers—of course there are very few in the county—and that they should pay for their own instruction, but we very often find that they will not do so, and they grumble and say: "We have to pay the rates, so why should not we have this particular mode of aid?"

8385. Would not you get over that by a system of examination?—You see the intellectual attainments of and advantages of the son of the large well-to-do farmer and the son of the small farmer may not be the same. The son of the large farmer would probably have been to the intermediate school whereas the son of the small farmer may only have been to the elementary school, and there would be a difference between their educational attainments.

8386. You suggest some better system in the way of continuation schools in the county?—I do.

8387. They would be attended by a lecturer from the College, I suppose?—Yes. I should like it to be kept in touch with the central institution.

8388. If you had those schools in different centres, all the boys and girls would have the same chance, would they not?—Yes, and I should suggest that they should be selected from candidates attending these continuation schools.

8389. You do not think it would be a good thing if all the county authorities pooled their scholarships and held examinations and allotted the scholarships where they thought best?—No, I do not think the counties would take the same interest in it; they like to have a voice in the handling of their own money.

8390. Do you get more applications for scholarships than you have scholarships to give?—Yes, that is always the case. We generally get treble the number.

8391. I think the Committee were interested in your remarks with regard to the co-operative society which you started, had that anything to do with the co-operative movement at St. Clears, where they had the co-operative dairy?—No, it is worked on quite different lines. Our co-operative movement is similar to the co-operative movement in Ireland, and another thing, as far as the St. Clears butter factory was concerned it was not worked on the same principle of co-operation as we work on.

8392. What have the old students done who have left the College. Have they helped to introduce a new spirit with regard to the College throughout the county?—Yes, they still take a great interest in the work of the College.

8393. You find the old students' association is a great help in that direction?—Yes, a very great help.

8394. I think you also said that there ought to be an agricultural lecturer and expert in the county. Do you mean a man who would be on the spot to enquire into economic problems which are closely connected with agriculture, and to institute a sort of bureau of information. Were you referring to a man who would do work of that sort?—Yes, a man who could carry out these experiments and demonstrate upon them and report on the work of agriculture generally in the county, and that he should be appointed by the Aberystwyth authorities.

8395. And that he should reside permanently in the county?—Yes, and I should say that he should spend the majority of his time in the county and organise agricultural education in the county.

8396. Also enquire into all sorts of problems closely connected with agriculture?—Yes, and a man that any farmer could approach.

8397. Have you tried any market day lectures in the county?—I think they were tried in the county just at the commencement of agricultural education there, but they were not successful.

8398. What is the attitude of the farmers especially towards the farm at Aberystwyth?—They have demonstrated a favourable attitude towards it.

8399. The attitude they take up is very different from what it was when the department was first started at the College?—Yes. When I addressed the Chamber of Agriculture some years ago on acquiring an experimental farm the Committee were unanimously in favour of establishing one.

8400. Have you an Agricultural Committee of the Agricultural Department established?—No, we have not.

8401. (*By Lord Barnard.*) You have no opinion to

give on the subject of instruction in forestry?—No, we have done nothing in that branch so far.

8402. I see you have a large amount of woodland in your county?—I think it comes about the second largest in Wales.

8403. 24,000 acres. Do not you think it would be

desirable if something could be done, not from the farmers point of view, because the farmer would not have many woods?—No, but from the farmers' point of view it would have a bearing upon the climate.

8404. But from a national point of view of timber growing I mean?—Yes.

Mr. H.
Jones-Davies.
13 June, 1907

Mr. B. T. P. BARKER, M.A., called and examined.

8405. (By Lord Barnard.) You are Director of the National Fruit and Cider Institute?—Yes.

8406. Which is established at a place called Long Ashton, near Bristol?—Yes.

8407. Would you mind telling us very briefly what are your qualifications? Are you a chemist?—I am, strictly speaking, a botanist rather than a chemist. As a matter of fact both chemistry and botany were my two subjects for the final examination at Cambridge.

8408. I see you are a Master of Arts; of what university may I ask?—Cambridge, having passed both parts of the Natural Sciences Tripos.

8409. Would you give the Committee a very brief statement of the history and formation of this Institute, and inform the Committee exactly what it is and what its functions are?—In 1893, the Bath and West Society started some experiments on cider making. These experiments were continued at Butleigh until 1902 under Mr. Neville Grenville's direction, Mr. Lloyd undertaking the experimental work. At that stage it was thought desirable to extend the scope of the work, and it was found necessary that more time perhaps should be devoted to it, and that the area of the work should be extended. As a result the Board of Agriculture took the lead in organising the foundation of a central institute at which experiments on cider making should be conducted, and also educational work as far as modern developments of cider making were concerned. In conjunction with the Board of Agriculture the County Councils of Devon, Somerset, Gloucester, Hereford, Worcester and Monmouthshire worked. Each of these bodies contributes towards the support of the Institute, and also the Bath and West of England Society. The form in which the Institute was established was that of a non-profit company. The site of the Institute is at Long Ashton, about four miles from Bristol, which forms a fairly central position for the whole of the counties interested. The land there which was taken over covers about 15 acres, and the buildings have been adapted from the state of ordinary farm buildings into buildings suited to the special purposes of the work. The constitution of the management of the Institute is a board of governors who are nominated by the contributing bodies and by bodies interested in the work, such as the Agricultural Department of Cambridge University, the Royal Horticultural Society and the University College, Bristol. In addition to this board of governors there is a managing committee of seven members who really are responsible for the general course and policy of the Institute.

8410. They are a committee of the board of governors, I suppose?—Yes. As regards the upkeep of the place, we receive grants of £300 a year from the Board of Agriculture, £100 a year from each of the following counties: Devon, Somerset, Gloucester, Hereford and Worcester, and £50 from Monmouthshire. In addition to these the Bath and West of England Agricultural Society contributes an annual grant of £100.

8411. Making a total of £950?—Yes. In addition to these grants, there are associated with the Institute individuals interested in the subjects which are touched upon in our work, and these either become members or associates. The members subscribe one guinea per annum and the associates 5s. per annum. The associateship was formed really to interest farmers themselves in the work. It was felt that there might be many who would be willing to subscribe 5s. a year, say, who would not care to become full members. Both members and associates have certain privileges, such as obtaining advice gratis from the staff, and also of having analysed each season a certain number of ciders or varieties of cider fruit, while they can also inspect the work being carried on at any time. The sales of produce also add a little to our income, and this is an increasing source.

8412. You have not told us what the number of members and associates is?—At the present time we have about 100, between 60 and 70 members and between 20 and 30 associates. The capital expenditure on the place had to be provided for out of the ordinary income. The Ashton Court Estate, on whose estate we are situated, are repaid a certain sum, £81 odd, each year for seven years, in respect of alterations of buildings, etc.

8413. You have not yet told us what the nature of the tenure of your property is. Have you a lease of it, or have you bought it?—We have a lease for seven years, renewable at the end of that time.

8414. What is the nature of the land—is it orchard?—We have 10 acres of orchard land, five consisting of an old orchard which was there when we took the land over, and five which we planted ourselves on taking the land, and the rest, which was pasture, is converted now into fruit plantations and a nursery.

8415. This was a sort of small farm, was it?—Part of a large farm.

8416. Forming part of a large estate belonging to a land-owner in Somerset?—Yes.

8417. Did you get it on favourable terms?—I really can hardly tell you the terms. That was all arranged before I came into connection with it.

8418. What rent do you pay?—The annual rent is £76 12s.

8419. (By Lord Moreton.) I take it that includes the paying off of the sum you mentioned just now?—No; £76 12s. per annum in addition to paying off the capital sum expended on buildings.

8420. (By Lord Barnard.) I suppose you have got considerable buildings?—We have a certain amount of buildings, they are not very extensive, but they are large enough for our cider work and laboratory.

8421. What do the buildings consist of?—There is a cottage, a laboratory, a cider-house, including a cellar, an apple loft, and accommodation for storage and plant.

8422. The adaptation of the premises was done by the landlord?—Yes.

8423. In respect of that you are paying £81 a year?—£81 a year for seven years.

8424. In addition to the rent of £76?—Yes.

8425. I do not think you can be quite right in your figure, but Mr. Brooke-Hunt is associated with the institute and he will give us the exact figures. Perhaps this is not a matter that is within your knowledge?—No, strictly speaking, it is not.

8426. You are the director of the scientific work which is carried on there?—Yes.

8427. Perhaps you will tell us what that work is?—The objects for which the Institute was started were experimental work and educational work relating to cider and fruit culture. In addition to those objects, the Articles of Association state that work in connection with vegetable culture may also be undertaken, and also any matters where the welfare of the industries concerned is involved. As regards the present facilities for work, our staff consists of Mr. Lloyd, who is honorary director and consulting chemist, Mr. Ettle, who acts as superintendent of the fruit department, and myself. I might state that Mr. Lloyd has a professional practice as an analyst in London, and that Mr. Ettle is Horticultural Director for Somerset, so that I am the only person on the staff who is able to give his full time to the actual work of the Institute. We employ a working foreman, who is qualified to do the necessary work of pruning and grafting, and so on, in the orchards and nursery, two labourers, and a boy. The equipment of the place consists of a laboratory, cider-house

Mr. B. T. P.
Barker.

8427b

8427c

Mr. B. T. P.
Barker.

13 June, 1907

8427d

and fruit-grounds, the fruit-grounds including five acres of a newly-planted orchard, five acres of an old orchard, one acre nursery, and two acres of fruit plantation laid out on market lines. Our work at present is very much restricted owing to the lack of staff, both as regards research and education. The research work in the laboratory is limited practically to that portion of my own time which can be spared from general work, which is composed of practical experiments in connection with fruit and cider, consultative work, management, visits to farmers and cider makers, Show work, and visitors to the place. The practical experiments are also to some extent limited by the same causes. The educational work is limited in addition to lack of staff by lack of accommodation. We are also very short-handed as regards labour. In particular, in the fruit section of the work when we are dealing with insect pests on the trees during the summer we find we have not sufficient labour to conduct spraying operations and other methods to keep down pests as adequately as should be done on a place which is generally looked upon as being, perhaps, representative of a model fruit station. The research work may be divided into two groups—the work in connection with cider, and the work in connection with the fruit section. Shall I give you the particulars of the main lines of research work?

8427e

8428. I think you might just tell us the headings?—In the cider department one of the main lines is the question of the investigation of the varieties of cider fruit which are at present existing. It has become quite clear during the course of the work that the kind of apple used has a very great influence on the quality and nature of the cider, and that different kinds have widely different properties. As regards the number of these kinds which exist they are almost unlimited.

8429. I do not think we want to go too deeply into it now that you have told us the headings unless you think it important that the Committee should know it?—It was only a matter of bringing out the number of these varieties. In each orchard in the West of England into which you go you find a different set of apples, and in many districts the apples go under different names, so that the whole question is very complicated.

8430a

8430. You hope in course of time, I suppose, to eventually increase the general stock of knowledge on that and as to the different kinds of apples available, and which are the most suitable having regard to the varying conditions of climate and soil?—That is it exactly: to select the proper sorts for propagation. Regular analyses are also made of these different apples each season. Another line of the work consists of investigations on the organisms of fermentation and other problems connected directly with fermentation. We also conduct experiments of different practical methods, variations in the methods as found in use in different parts of the country. The question of blending has also been dealt with and also the disorders to which cider is liable. We devote a considerable amount of attention to this point, as each year in certain districts of the cider making counties a great loss of the cider in value is due to one particular disorder—cider sickness. Many important lines of work have to be practically left untouched owing to our lack of staff, such for instance as the raising of new varieties of cider fruit. In France they have managed to improve the quality of their cider enormously by paying special attention to the raising of new varieties and to the improvement of the older kinds. The questions of soils, season, and the age of the tree are also probably of very considerable importance, but the field opened in these questions is so wide that it is impossible for us in the present circumstances to deal with them. Special attention is also required regarding chemical changes in the ripening of the fruit and during the course of fermentation and the maturing of the cider. An extensive investigation into the properties of the different kinds of yeasts and other ferments of cider is also necessary. There are also many varieties of apples existing in the orchards whose properties are unknown, that is to say there are probably some very valuable kinds which have been completely overlooked. No doubt very useful results would be obtained if a special investigation could be made into the characters of some of the lesser known varieties of fruit. Most of these points are intimately connected with the quality of the cider and are more or less bound up together, so that for the work to go on under really favourable conditions these points should be taken in hand concurrently, rather than dealt with individually and in an isolated manner from season to season, since the conditions are always

8430b

variable. One never has juice of the same character to deal with twice, and so many different factors enter into the question that investigations into a particular point are made very much more difficult by not knowing in the least degree the influence of some of the points which we have raised. In the fruit section of the work we have a young orchard in which experiments relating to the grassing over of the ground under the trees has been dealt with, the influence of an intermediate stock, head grafting and base grafting, and also variety tests. This young orchard is composed entirely of cider and perry varieties of fruit: there is also a nursery of one acre in extent in which we are propagating the best varieties of cider and perry fruit, paying particular attention to old sorts of high reputation which were in danger of dying out. There are two fruit plantations which have been laid out more or less from a market point of view, and in these we are conducting variety tests, pruning experiments, and experiments on rough and deep planting.

8430c

8431. When you speak of fruit plantations are you referring solely to cider fruit plantations?—No, these are market plantations: they consist of apple and pear trees between which are planted bush apples and pears, and between these again raspberries, currants and gooseberries, with rows of strawberries alternating. They will eventually be orchards. A comparatively small increase in our income would mean a relatively large increase in the amount of work which could be done, since we have already the establishment provided and practically an increase of staff only is necessary. The educational side of our work is only possible at the expense of research. As regards our present efforts we issue reports and other publications such as leaflets dealing with matters of particular interest to cider makers and fruit growers, and also giving accounts of the results of the experimental work which is being carried on. We send educational exhibits of cider and exhibits illustrating the fruit side of the work to the annual shows of the county agricultural societies, including only those counties which contribute towards the support of the Institute. In that way we come into touch with a good many farmers and others whom we should hardly meet with otherwise. Visits are also made to farmers and cider makers to give them advice on special problems, and also to advise them with regard to their plant and machinery, etc., for cider making. Each year a tasting day is organised, when all interested in cider making in the contributing counties are invited, and the ciders made in the course of the experimental work of the preceding season are all sampled, so that they may see for themselves how the experiments resulted. Parties are also organised at intervals in the contributing counties to visit the place while cider making is in progress, and to inspect the fruit grounds at different seasons of the year. On matters relating to cider and fruit growing conferences are also being organised, and we are hoping to be able to give a certain amount of instruction to the horticultural instructors in the contributing counties on special technical points dealing with cider making, particularly with the fermentation side of cider making, so that in their work in their respective localities they may be able to deal with the matter more fully than they would otherwise. We are also open to take pupils either as working pupils to take part in the general work of the place, both cider making and fruit growing, and also for special instruction in the scientific side of the work in the laboratory, but our facilities particularly for the laboratory work are very limited at present: the laboratory is only a small one. The other work is mainly consultative. Our members and associates consult us on matters relating to disorders of cider, analyses of ciders and cider fruit, and in the fruit growing section, to insect and fungoid pests in particular. As regards the steps which we have taken in connection with the welfare of the industries concerned, we have taken a leading part in organising a deputation to the Board of Agriculture in connection with cider adulteration and have made special analyses of ciders on the market to determine how far adulteration does exist at present. We have also taken steps in connection with the railway rates for cider fruit, which are at present high. We find that there is a certain amount of difficulty in coming into touch with the contributing counties as closely as we should like. It is impossible practically for one man to cover the six counties in a satisfactory manner.

8431a

8431b

8431c

8431d

8431e

8431f

8431g

8432. Have not you representatives of each of the contributing counties on your Board of Governors?—Yes, but I was rather referring to visits and so on to farmers themselves—coming into touch with the farmers directly and bringing them directly into touch with our work. In connection with the question of grants from

8432a

8432b

the County Councils, I believe that they can only be made to institutions where educational work is being carried on at present, so that the research side of our work is bound to be affected owing to our relations with the counties over the question of grant. It is hoped that we may be able to co-operate more closely than hitherto with the agricultural departments in the contributing counties and work especially in conjunction with the horticultural instructors. In our nursery we have a large number of young cider fruit trees almost ready for distribution. It is hoped with these to start local centres and experimental orchards in different parts of the contributing counties, where experiments carried on at the Institute can be duplicated, and possibly also a certain amount of cider work may be conducted at the same time.

8433. I hardly think you need trouble the Committee with explaining the efforts which you propose to make with regard to the future organisation of the counties. On the subject of education, do you have any classes?—We have no regular classes.

8434. Have you any pupils at the Institute now?—We have not at present; we have had a few only. But, as I explained, our staff is so limited that proper time cannot be given to the educational work without interfering directly with the experimental work.

8435. On the subject of cider growers and fruit growers appealing to you for information, do you have many appeals for assistance and advice?—Yes, repeatedly.

8436. Is that increasing?—Yes.

8437. You find that there is increasing confidence among cider growers?—Undoubtedly.

8438. Have you any other topics on which you wish to give the Committee information?—The only other matter to which I was going to refer was in connection with the proposed Department of Economic Biology at the University College at Bristol, but I do not know that that need be brought up.

8439. We have had some evidence about that. You mentioned the exhibiting at shows. Is not that an expensive thing?—It is. We found it so expensive last year that we have had to limit our exhibits this year to shows where part of our expenses are borne by the society itself.

8440. I think, if my recollection is right, at some show or other there was a cider exhibit, the principal part of which was the offering of free drinks to the public. Do you do anything in that way?—Yes, but we restrict the sampling to those directly interested in cider making.

8441. Still, it is an expensive thing to have these stands at the shows?—It is expensive, but we have no definite stands. Arrangements are made for us inside a shed as a rule where there is a forestry or nature study exhibit; we are generally placed in that part.

8442. I suppose travelling expenses amount to a large sum?—Yes, a large total.

8443. Who controls the finance of this institution?—The Managing Committee control that.

8444. Has the Managing Committee a clerk or secretary?—They have an honorary secretary and an honorary treasurer.

8445. Somebody must keep the accounts, I suppose, as you spend the best part of £1,000 a year?—One of the clerks in the treasurer's office undertakes the account work for us.

8446. He is not a clerk belonging to the Institute?—No.

8447. I confess I have been a little surprised—no doubt it is owing to my want of knowledge of the district—at the necessity for the expenditure of so large a sum in connection with this particular industry. Is the industry of very great importance? Have you any figures as to the value of the cider that is made in a year or anything of that kind?—I have a few figures that I can give you.

8448. I will put it in another way. I apprehend one object you have in appearing here to-day is to impress upon this Committee the necessity for increased funds for the use of your Institute?—Yes.

8449. From what you have already told us you do not anticipate that any more funds can be obtained from the County Councils?—I see no prospect of getting them at once.

8450. Am I right in thinking you suggest that the Government is the only source from which you expect to get a grant?—That is so.

8451. I want you to make quite clear the grounds on which you suggest this Committee, if they think fit to do so, should recommend that a further grant towards your Institute is necessary. One of the grounds, no doubt, would be the enormous extent of the industry?—Yes.

8452. (By Lord Moreton.) Am I right in saying that the improvement which has been brought about by modern scientific methods of cider making has raised the quality of the cider that is made all over the country?—Yes. Putting the estimate at a low figure, the cider produced in Somerset alone may be estimated at £250,000 worth annually, and before the Departmental Committee on Fruit Culture an estimate was given as to the value of the cider produced in Hereford annually, and that was put at £600,000.

8453. That leaves Worcestershire, Devonshire, Gloucester and Monmouth and the other cider areas, without any figures?—Yes.

8454. (By Lord Barnard.) Of course your operation include other fruit growing as well?—Yes.

8455. There are a very large number of occupying tenants engaged in this industry in the counties?—Yes; almost every farmer is a cider maker in a small way.

8456. Is it among the products of his farm for marketing?—In many cases it is not for marketing, because it has been the custom to make it for the men largely, but many of the farmers now find it profitable to put it on the market, and they are paying more attention to its production for that reason. Undoubtedly a great many tenant farmers make a big income from it, and of course we deal not only with the cider work, but also with fruit growing.

8457. You have already given the Committee information on the point that your staff is insufficient and your time is too much taken up. Have you any other points you wish to urge upon the Committee as to the need for further funds, because, of course, you realise that the exchequer of this country is not unlimited, and is fed solely from the pockets of the taxpayers, if you want some further assistance from those taxpayers you must make out a very strong case for it. That is what I want you to do?—Our case practically is that by experimental work we hope to be able to put before the cider makers a better means of producing their cider, so that its value may be increased.

8458. It will be a matter of profit to the cider grower, and the fertility of the soil will be added to?—Yes, and in connection with the fruit growing, to show them the best varieties to grow, and the best means of culture.

8459. (By Lord Belper.) I gather you are supported by the several County Councils to some extent?—Yes.

8460. I did not catch the drift of your remarks when you said that the County Councils could not do any more for you because they would not contribute to research work—it was something in that sense?—The research work was to some extent hindered by the fact that we must largely depend on the County Council grants for our support, and that in order to earn these grants we must take up educational work as far as possible.

8461. And, therefore your research work is naturally limited because of the lack of staff and funds?—Yes.

8462. Is the only object of this institution the teaching of matters in connection with cider making?—And fruit growing.

8463. Fruit growing for cider making or all sorts of fruit growing?—All sorts. Market fruit in addition to cider fruit.

8464. To encourage farmers to have small orchards and grow fruit of all sorts where suitable?—Yes.

8465. You have got a fair grant considering the limited scope of your institution?—Yes, either for research, educational or practical work separately, but not for all three together.

8466. Have you compared what you are getting with what the agricultural and dairy colleges are getting which are doing work in all branches of agriculture. You can hardly say that you are not receiving your share either from the Board of Agriculture or from the counties. I do not mean to say you would not like to get more, but if you take the amount of money that is at present available either from the Board of Agriculture or out of the grants which the County Councils devote to the purpose, if you look at the sums that are being given to much larger institutions than yours, and who are teaching agriculture in a very complete and wide manner, your grant is not a very unreasonable one?—I know very little about the extent of the grant.

Mr. B. T. P. 8467. You get £300 from the Board of Agriculture ?—
Barker. Yes.

13 June, 1907 8468. The utmost they give to any college is £1,000 ?
—Yes.

8469. And many colleges get very much less, even although they are teaching every branch of agriculture, and dairying and practical agriculture as well ?—On the other hand, I believe we are the *only* institution dealing with the special points connected with cider and fruit growing.

8470. (*By Lord Moreton.*) Supposing you had more money, would you think it advisable to do anything as regards bringing the teaching of education in pruning and the care of cider trees more before the local public ?—Undoubtedly.

8471. Would you agree with me, though I am only speaking of one county, that there is a very great want of knowledge as to the proper care of the trees ?—That is so.

8472. And also—I do not know now so much about it as I did at one time—the very considerable care there ought to be in the treatment of the fruit between the time it left the tree and became cider ?—Yes.

8473. If you had more money you could bring more modern ideas to bear possibly on those who are actually making it on the smaller farms ?—Yes, we find it a difficult matter to deal with the farmers satisfactorily unless we go to them personally, and of course a large staff is necessary to cover six counties.

8474. You would agree with me that in spite of the scientific investigation which has taken place during the last few years, and all the great knowledge that has been accumulated with regard to the scientific side of cider making, even now there is considerable work to be done in demonstrating and bringing home, to possibly the smaller makers chiefly, the advantages to be gained by care and cleanliness, and adopting more modern systems than have been adopted in the past ?—That is so.

8475. (*By Mr. Latham.*) I presume you agree with me that the cider of to-day is quite a different article from what it was formerly ?—Yes.

8476. That has been brought about by what has been done by the Bath and West in the earlier days, and what has been done by you latterly ?—Yes, that is so.

8477. To go back to the expense of exhibits at agricultural shows, it is about the only chance you have of setting before the world the improvements that you have been able to bring about ?—It is one of the chances ; we have not very many, unless we can get the people to the Institute itself.

8478. If you do not have these stalls at the agricultural shows the cider makers would have very little chance of knowing about the advances that have been made in the cider industry at the present day ?—That is so.

8479. Now with regard to the money you receive in the way of grants, is not the cider making industry a very important one in your part of the country ?—Yes, and it is getting more important each season.

8480. And although a vast deal has been done there is great room for research at the present moment ?—Great room.

8481. If you could get more money and more assistance it would be a great advantage not only to the producer but also to the consumer ?—That is so.

(Lord REAY in the Chair.)

8482. (*By Professor Middleton.*) In connection with your work, I do not think you mentioned anything about control work. I do not know whether you include that among your functions ?—Yes, I include that as one of the functions, certainly.

8483. Do you agree there is a considerable amount of work in that direction to be done in the cider industry ?—Undoubtedly.

8484. I have been following your argument with reference to the case which you are able to make out for increased grants for cider. I do not know the cider districts myself, and I should like just to summarise what I take your argument to be. It is, as I understand it, that the cider making methods are very varied and some of them are very indifferent, or all ?—Yes.

8485. You think although the industry is a limited one, that there is a very great chance and possibility of improvement ?—Yes.

8486. You have told us that in two counties the cider

alone was worth something like £800,000 per annum ?—Yes.

8487. So that even on those two counties alone the amount you spend would be equal to something less than one-tenth of one per cent. of the total value of the cider ?—Yes.

8488. Therefore, seeing that there are such possibilities of improvement in fruit and cider work, one may very reasonably give increased grants for an institute of this sort, although the industry itself may not be, as compared with some of our other agricultural industries, a very big one ?—That is so. I might mention, perhaps, that cider making seems to be spreading now from the West of England counties into other parts.

8489. But even with the size of the industry at present the amount that is being spent by the institute is very small if we consider the possibility of improvement ?—Yes.

8490. The other point you made was that scientific assistance was necessary, and you yourself required assistance. You have had some years experience in conducting investigations in cider, and I would like to ask you what type of man you would require as an assistant. We have heard a great deal about the training of men for higher work, but from your experience of the sort of men you have had as assistants in cider work I should like you to tell us what sort of preliminary training should he have had ?—Providing he had a good training in chemistry and was fitted naturally for experimental work he would be a very suitable man.

8491. Would you say that a man who was going in for that sort of work should at least have passed Part I. of the Cambridge Natural Sciences Tripos ?—Yes.

• 8492. Is it necessary he should have taken Part II. ?—Not necessary, but it might be desirable. The better the man of course the better the work to be expected of him.

8493. You consider the man who had done well in Part I. would be suitably trained for a beginning ?—Yes, because cider work itself is so much apart from other work in a sense that a man has to become quite a specialist.

8494. Cider work is very specialised, perhaps a good deal more so than our agricultural work, but is it not very necessary that one who is going to specialise and to do special work should have a fairly broad preliminary training ?—Undoubtedly.

8495. I do not know whether it is true of cider, but it is true of most agricultural subjects, that the specialisation cannot be quite so complete as it can be in some of the other industries. You must have a broad preliminary training before one is really able to make much advance in agricultural work ?—Yes.

8496. Your selection, if you were selecting an assistant, would be of one who would be at least up to Part I., and possibly to Part II. ?—Yes. I think in the present state of affairs such a man could do more useful work than a man with less qualifications in chemistry and botany.

8497. Those are the two subjects which for cider making are most important ?—Yes. I am speaking now entirely of research work, and not from the educational point of view.

8498. I am referring to research work and the kind of work you wish an assistant for.—Yes.

8499. (*By Mr. Medd.*) Can you tell me the extent to which the cider makers consult your Institute. There is a very large cider industry in Devonshire, and also to some extent in Herefordshire, and in Somerset. To what extent do they consult you ?—In what way do you mean.

8500. Either as to the manufacture or as to the best type of apple, or the preservation of the apple, or any matter connected with the manufacture of cider ?—We are repeatedly consulted by them ; I could hardly give you any figures as to the extent.

8501. You quoted just now a very large figure as applying to the manufacture of cider, for instance in Somerset ?—Yes.

8502. Do an appreciable number of Somerset manufacturers consult you ?—Yes, particularly from the district where the best cider is made.

8503. Have you any record of the number of applications that you receive ?—I have not a record of the number of applications, but I have most of the applications by me.

8504. Does the same apply to Devon ?—Yes, but to a less extent in the case of the counties far removed from Bristol.

Mr. B. T. P.
Barker.
13 June, 1907

8505. In basing your claim for additional aid you must prove your immediate value not as an institute for research, but as an institute for aiding the cultivators, so to speak, in your immediate district?—It may give you some idea if I tell you that on our last sampling day we had between 70 and 80 farmers and others interested in cider making from the different counties at the Institute. Of course, that, I take it, may be considered a large number, considering the distance that so many of them have to come.

8506. I think you embrace six counties?—Yes.

8507. There must be, I suppose, considerably more than 70 or 80 cider makers in that area?—Yes.

8508. Do you inspect orchards and also advise as to the treatment—are you prepared to inspect orchards on application to you?—We make every effort to do so.

8509. Do you as a matter of fact have any applications, or does the manufacturer of cider rely on his own knowledge and experience?—We have applications at times, but a good deal of that work is done by the horticultural instructors.

8510. Then there are horticultural instructors covering exactly the same ground as you are?—So far as a certain part of their duties is concerned; they are supposed to advise as to the methods of treatment of orchards.

8511. Do you give any lectures or addresses on the manufacture of cider?—We have done nothing much in that way yet. I have given one or two short papers in connection with the subject of cider myself at one or two of the societies, but only one or two.

8512. How far do you think your educational work could be developed?—It could be developed very considerably under more favourable financial circumstances.

8513. That means that you require more money?—Very largely; it is a question of staff practically.

8514. Exactly, but if these horticultural lecturers are equally competent to advise on orchards and to some extent on the manufacture of cider, where do you come in?—In the present state of affairs hardly any of them, I believe, have had any practical acquaintance with the making of cider. They would have to come to us for advice in matters relating to cider.

8515. It could not be said that the necessity for an institute such as yours had died away now?—That could not be said at present, certainly.

8516. How far are you a trading concern?—We are a trading concern in so far as we dispose of the produce of the experimental work, but no further. We endeavour in selling off the cider that we have made to interfere as little as possible with the ordinary makers.

8517. What is the value of the produce that you sell?—£75 to £150 a year.

8518. You sell fruit trees to some extent?—Not fruit trees, only fruit.

8519. You have never attempted to lay out an orchard for other people?—Not for other people yet.

8520. Have you advised as to the best kind of trees that should be grown for cider making?—Repeatedly.

8521. What is your fee for that?—We do not charge any fee to residents in the contributing counties. Those who want advice on the subject are asked to become members of the Institute, and in many cases they either become members or associates.

8522. Have you any pupils attached to the Institute?—We have had a few, but not many.

8523. Have you any now?—No, not just at present.

8524. They are apprenticed to you when they come, are they not?—Not strictly apprenticed.

8525. What fee would they pay?—For work in the laboratory they pay a fee of 10 guineas for the three months' course, or four guineas per month; working pupils are paid by us at the rate of 7s. 6d. per week as a contribution towards their living expenses and in return for their labour.

8526. Do you not think you must make your institution an educational institution so far as possible?—We endeavour to do so as far as possible, but we have to remember that perhaps the first function for which the place was started was research. The whole work was started by way of experiment, and this is practically a development and extension of the previous course of experimental work.

8527. You referred just now to the possibility of

affiliation to Bristol?—Not of affiliation. At present, I take it, it is a question of working in as close association with them as possible. They have, of course, compared with us, an extensive staff and good laboratories which would be very useful from our point of view, while we, on the other hand, could assist them with the experiments in the fruit section on a practical scale.

8528. You would like to use their laboratories if possible?—We might do that if arrangements could be made.

8529. (By the Chairman.) Amongst your other work, you attempt to fight insect pests?—Yes, we have tried several methods; we are experimenting with several methods against the insect pests, but our work in that respect has been considerably limited by lack of funds.

8530. You would like to give further attention to that work?—Yes.

8531. For that purpose you wish to have a certain number of assistants?—Yes.

8532. You do not think in extending your educational operations you would thereby limit the research work?—Under present conditions we should.

8533. You think it of the utmost importance that research work should not be limited?—Yes, in the present state of affairs.

8534. You think what the cider industry wants most of all is research?—Yes. There is plenty of room for education, but, in my opinion, research is even more important, at present.

8535. You have no machinery on your premises yet, have you?—Yes, we have a complete cider making plant and machinery.

8536. I have here Mr. Brooke-Hunt's pamphlet, and there it is stated that the premises are not fitted up with machinery; they have been fitted up since that was issued?—Yes.

8537. Would you describe what that machinery is?—It consists of a mill and a press, with a steam engine for driving the machinery, and a boiler which is used for steaming out the casks and sterilising the apparatus used. That is practically the whole of the plant.

8538. That will not require extension?—No.

8539. You think that plant is adequate?—Yes, we should require very little extension in that way.

8540. You have a laboratory?—Yes, but it is very small.

8541. That would require extension?—Yes, with a larger staff, or if we have to take pupils.

8542. If the institution were thoroughly well equipped for research purposes, not for educational work, how many assistants could you employ usefully?—We could employ usefully at least two assistants, giving their whole time to the work, a chemist, and a biologist: but there is plenty of other work—and good work—for others as well.

8543. They would be men of high standing, as you have described in your answer to Professor Middleton?—Men who would have a good training, not a high scientific training, although, of course, that would be better; you want men as good as you can get.

8544. Supposing the Institute were to be extended on its educational side, how would you organise that. I mean what kind of courses would you give—over what length of time and for what kind of pupils?—Farmers' sons mainly, and courses for cider work for about four or five weeks, perhaps longer, during the cider making season, from November to Christmas, or from the beginning of October to the end of November; so they would see a good deal of the actual process of cider making.

8545. Then I suppose in winter you would give them evening classes?—Yes.

8546. You would be in favour of making it a winter school?—Practically.

8547. You think you could give them useful training in the six winter months?—I hardly think so long a period is necessary for the cider work, and the fruit work could be done, perhaps, better during the summer months.

8548. I am not talking of the theoretical part of the lectures in biology and chemistry and botany. That would require a longer course?—Yes.

8549. You like your pupils to be well prepared, of course?—Yes.

8550. It would be better if they came to you from

Mr. B. T. P. Barker. secondary schools rather than from elementary schools ?
—Yes.

13 June, 1907 8551. That would meet your object ?—Yes.

8552. Then you think after they had been with you it would be an advantage for them to go to the University College at Bristol ?—Yes.

8553. I suppose the University College at Bristol is contemplating the establishment of an agricultural department ?—Hardly what one would call an agricultural department. They propose at present to limit it to a department of economic biology.

8554. It would be part of the curriculum of your pupils to attend those lectures ?—They are not intending to give any lectures in connection with that department. It is purely consultative.

8555. Research work ?—No ; to give advice.

8556. But advice, of course, means on the work they have carried out at the laboratory ?—Yes.

8557. Therefore it is research in that sense ?—Yes.

8558. They do not propose to give lectures at the University College of Bristol, you say ?—No.

8559. Do you think lectures could be given in economic biology with advantage ?—Yes, undoubtedly.

8560. Supposing your institution were turned into an educational school, would you give lectures in economic biology and make that one of the branches ?—That would almost follow unless a course were given at the University College. It would hardly be worth while to have courses at both places.

8561. I quite agree with you, but it ought to be given at either one or the other ?—One or the other ; that is a very important side of fruit growing work especially.

8562. On the whole the farmers appreciate the work done by your institution ?—Yes.

8563. And they come to you for advice ?—Yes.

8564. (*By Professor Middleton.*) I gather from your evidence that the type of educational course you have in your mind is a practical course in improved cider making similar to courses that are given in cheese making in a cheese school. I did not understand you to mean that you thought of developing a theoretical course at the Institute ?—We might, perhaps, have to run two courses to suit the two classes of pupils we already take—the pupils who do scientific work in the laboratory and those who are purely working pupils ; the same course would hardly do for both.

8565. The courses for young farmers would be of a

practical nature ?—Yes, with just sufficient of the theoretical side to enable them to grasp things.

8566. Such an amount as could be given them in the five or six weeks' course that you mentioned ?—Yes.

8567. (*By Lord Moreton.*) Besides the actual manufacture of cider a great deal of instruction would have to be given with regard to fermentation and so on and when the cider began to work. Would you attempt to teach not only the manufacture but the after operations connected with the manufacture ?—Yes.

8568. A very short course would not give you time enough to cover that, would it ?—Not the short course.

8569. (*By the Chairman.*) We have had evidence to the effect that on the continent they have what is called a winter horticultural school, that is a school where two winter courses are given, each for about three or four months, where both theoretical and practical lectures are given, not to persons who require high scientific training, but to people who are intending to do the practical work ?—Yes.

8570. So that that shows the importance which is attached to a regular course of training—as I say, they have two winter courses ?—Yes.

8571. I think that shows the importance of giving as much time as one possibly can to the pupil ?—Yes, certainly. As much time as would be practicable.

8572. Of course your fear is that they would not attend. I quite understand that, but if they could be got to attend you would have no difficulty in organising courses for that kind of individual, at least for four or five months in winter ?—No.

8573. You would see no difficulty in that ?—No. From October, say, until the end of March. In that time they would see most of the inside part of the work.

8574. Quite so ; and you would have them in the summer in the plantations ?—Yes.

8575. (*By Mr. Latham.*) Would not it be almost impossible to found a six months' school for teaching the branch that you are now in, for dealing with cider work and fruit growing work ?—A person would not have more than covered the whole ground during six months. A year is necessary to cover the ground in fruit culture.

8576. It would be a new departure, at any rate ?—Yes. Of course there are no facilities at present for it.

8577. You would have to reorganise the whole place for any thing of that sort ?—Yes. I think the whole system would have to be reorganised, although it is not so much a question of reorganisation as a question of the lack of funds.

EIGHTEENTH DAY.

Tuesday, 18th June, 1907.

PRESENT :

The LORD BARNARD (*in the Chair*).

Lord MORETON.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor SOMERVILLE, D.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. W. ANKER SIMMONS, called and examined.

Mr. W. A. Simmons.

18 June, 1907

8578. (*By Lord Barnard.*) You are a surveyor ?—Yes.

8579. I see you are a chartered surveyor ; will you tell us what that means ?—A member of the Surveyors' Institution.

8580. You are a member of the firm of Messrs. Simmons & Sons, land agents, valuers and auctioneers, of Henley on-Thames, Basingstoke and Reading ?—Yes.

8581. You have had a considerable number of years' experience ?—I have. I have been a partner in the firm since 1883, and I went into the office in 1873.

8582. Over 30 years ?—Yes.

8583. Your business extends over a great many of the southern counties ?—Yes ; we have land in ten different counties that we are agents for.

8584. Naturally during that time with those facilities you have acquired a considerable insight into agriculture in the south of England ?—Yes, I have had every opportunity of acquiring that.

8585. Have you farmed any land yourself ?—Yes ; we

never farm less than 2,000 acres, sometimes more; at the present time it is a good deal more.

8586. Is that land for which you are agents belonging to trustees and so on?—Yes. I do the whole thing myself the farming and the buying and selling—everything.

8587. You are a member of several associations?—Yes, I am a member of the Farmers' Club, and on the Council of it, and secretary of the Berks and Oxon Chamber of Agriculture. I have taken a keen interest in agriculture all my life.

8588. You are in close touch with farmers over a very wide area?—I am.

8589. You take a great interest I believe in the question of scientific and technical instruction in agriculture?—Yes, I am naturally very much interested in it to see to what extent it is likely to benefit agriculture.

8590. You have formed certain definite opinions on the subject?—I have.

8591. Perhaps you would just briefly state to the Committee what those opinions are?—Briefly my opinion is that the inclination is to pay too much regard to science and not enough to practice. Of course I am looking at the question entirely from a farmer's point of view, and while I admit that the education which is given at our agricultural colleges must be of great benefit to agriculture, not so much from the number of students it turns out, but by reason of the great attention it has called to agriculture and the impetus it has given to intellectual farmers to seek for information which previously they did not seek for, yet, looked at from a farmer's point of view, and particularly from the point of view of the way in which it is likely to benefit the rising generation of farmers, I cannot help thinking that it might be possible to give a more practical education with not quite so much science. It is all very well to aim at making every farmer a chemist and a botanist and a geologist and a veterinary surgeon, and so on, but it would happen in a very very few cases that a man would become thoroughly well equipped in all these departments, and what you really want to try to aim at I think is to induce the rising generation of farmers to see that up to a point science can help them to a very great extent in their practical lives.

8592. Does your criticism extend to any particular form of imparting scientific agricultural education?—If you take chemistry for example—

8593. I do not mean the subjects of instruction; I mean any particular form of institution. Which form of institution do you think is least useful?—I think the big institution is the least useful, the big colleges, and I think the most useful is the small school like Basing. That is a school I have had under my notice for some time, and I do not hesitate to say that from a practical point of view the student at Basing gets an education which is of more value to him as a farmer than the student who goes to Reading or Wye.

8594. Would you like to see more schools of the type of Basing established?—I would. I think if you had schools of that character where students could get a short course of instruction it would be of the greatest benefit, but it is useless to think that you are going to get the ordinary farmers to send their boys to an agricultural college for a year or two years. I think if you could get a short course of scientific instruction to be given at times in the year when little would be doing on the land, say in November, December, January and February, you would do a great deal of good.

8595. You would agree with all the previous witnesses probably, and I think it is the opinion of most of the Committee, that practical work on a farm is essential?—Absolutely.

8596. In your opinion it should be the main part of the young man's upbringing?—I think so. I am quite sure of this, speaking as a practical man and one who has been brought up in a very practical school, that you can only learn farming on the land; you cannot learn it by book any more than you can learn engineering, for instance, by book.

8597. I suppose you would admit that the application of science to practical agriculture is possible and advantageous?—Yes, certainly.

8598. Would you agree with me that in order to obtain that information you must have institutions for higher work in agriculture?—Certainly.

8599. You say later on in your *précis* that you are of opinion that great assistance could be afforded to young

farmers if courses of lectures were given in the market towns connected with their farms?—Yes.

8600. Of course you are aware that that has been practised in some counties to a very considerable extent?—Yes, it has, and I have seen a good deal of it. I had charge for some time of a migratory school in dairying. But the fault of those lectures lay in the fact that they sent the wrong men to lecture. If you send a man to lecture to farmers you must have a man who shows to a farmer at once that he knows what he is talking about from a practical point of view. I am speaking more of the time when lectures were first started; I myself have been present at lectures given by men who proved to every practical man in the room before they had been speaking five minutes that they did not understand what they were talking about except from a strictly scientific point of view.

8601. You, I notice, also lay stress upon the value of the lecturer thoroughly understanding what he seeks to teach and how to impart the knowledge he possesses?—Yes. That, of course, as you know, is most important; there are a great many men who know a great deal but who cannot teach it, and, I think, quite as much attention should be directed in instructing the instructor as to how to impart the knowledge he acquires, as to any other point.

8602. Men must be trained as instructors somewhere?—Yes, and, I think, that should be part of the duty of these large agricultural colleges where there is every facility for properly training them.

8603. Do you know any of the sons of large farmers, we will say, who have been educated and have become teachers?—No, I cannot say that I do, personally.

8604. Do you know, as a fact, that a very large number of these teachers have come from farms and have been brought up on the land?—Yes, I know that is so.

8605. Do you think it is desirable and possible to extend that?—Yes; they would have much more weight with those whom they sought to teach than the men who did not possess that advantage. As a proof of what may be done in the way of lectures by a competent man, I may say that Mr. Percival, of Reading College, who, as you know probably, is the director there, has done a great deal of good by giving lectures on stated subjects on Saturday afternoons at Reading, that being the market day, and a great many farmers and men you would hardly expect to see there have attended those lectures, which are extremely able ones and give a lot of information on subjects which are calculated to be of use to a farmer.

8606. Do you not think it is possible, owing to the fact that 20 or five and twenty years ago there were hardly any means by which a farmer could obtain information outside his own knowledge and that of his immediate neighbourhood; and that the system, or rather lack of system, sprang up of farmers relying upon themselves and upon local knowledge, that that system has got to be broken down and that it will take time?—Yes. Of course, it is impossible even yet to gauge the benefit of what has happened in the last 10 or 15 years because a man must have time to develop. You do not make a farmer in 20 minutes, it takes years for a man to prove himself to be a success or otherwise, and the chances are we would be better able in 10 years' time to say whether the result of what has been done during the last 15 or 20 years is favourable or not than we should be now.

8607. Is it your experience that the value of this information, whether by lecture or otherwise, is being more and more appreciated, and that farmers are more and more inclined to listen to this kind of thing and to absorb it?—Yes, they are. I was talking to a young farmer last night who farms very largely. I mentioned to him that I was coming here to-day, and he told me that he was only expressing the wish a few days previously that he had been born a little later so that he might have had the advantages which the young men have got now of acquiring a certain amount of scientific knowledge in regard to farming which undoubtedly would be of much use to him. He is a man of my own age who is quite young enough still to avail himself of learning anything that would be useful to him and would do so. He is just the kind of intellectual man who would attend a course of lectures that would be likely to be of benefit to him.

8608. Of course, you will agree that among farmers, as among all classes of the community, intelligence varies?—Very much.

8609. And some men are much more capable of acquiring and absorbing scientific information than others?—

Mr. W. A.
Simmons.

18 June, 1907

Mr. W. A. Yes. I think that applies, perhaps, to farming more than anything else.

18 June, 1907 8610. Perhaps, you will also agree with me that the men, unconsciously no doubt, influence their neighbours ?—They do.

8611. So that really and truly the spread of information is very desirable ?—It is most desirable.

8612. You express an opinion on the financial side of the question ?—Yes. As you know, that has been one of the worst points of the farmer's life. They are wretchedly bad book-keepers ; nine-tenths of the farmers keep no proper system of accounts at all. I have done, in my own neighbourhood, all I can to induce farmers to keep proper accounts. I have offered to make annual valuations for them at a nominal fee in order to induce them to do it, but, although some have started, they will not keep it up for any length of time.

8613. Do you not think the practice of keeping accounts, particularly among the larger men, is growing ?—Yes, undoubtedly it is growing, but the farmers, as a rule, are very slow, I must say, to improve in that way.

8614. That is no reason why those who are interested in the subject, such as landlords and land-agents, like yourself, should not go on trying to impress upon them the necessity of it ?—No, and I, personally, never cease to impress the necessity of it. I do not for a moment advocate very elaborate accounts because farmers would never keep them, but a farmer ought always to be able to know where he is financially, and to be able to ear-mark any particular loss so as to know at once where the loss is and to remedy it if possible, but very few men can do that at present.

8615. So as to be at once able to estimate the cost of a particular crop, and so on ?—Yes, and what the purchase of certain manures, and so on, has done, whether he has gained or lost by it.

8616. On the question of public finance, what is your opinion with regard to the sums which have been spent by county councils ?—I think there has been a great deal of money wasted on such subjects as bee-keeping and horticulture ; a great deal of money has been spent in England for such purposes—amounting to about £90,000 a year, I think, now. The colleges only get less than half that amount, between £30,000 and £40,000 a year or something like that, and I cannot help thinking that it would be possible to get more for the money that is being spent at the present time.

8617. You will admit that we are still going through an experimental stage ?—Yes.

8618. Therefore a certain amount of money must inevitably be wasted during such a process ?—Yes, that is bound to happen.

8619. Of course one of the objects of this Committee is to see how that waste of money can be prevented ?—Yes, to find out the weak parts of the scheme.

8620. Of course by the word waste I do not mean, and you do not mean, that money has been deliberately thrown away, but simply that some people are of opinion that the results do not justify the expenditure ?—Exactly.

8621. You, of course, are not of opinion that lectures on bee-keeping and so on are useless ?—No, not useless, but I rather think too much money has been spent on that and such like subjects.

8622. Do you think a young lad, a farmer's son, should go to a secondary school ?—An ordinary farmer's son I think, would get all the information he wants either by a short course at a school like Basing, or if he could not avail himself of that, by having the opportunity of attending a course of lectures in his market town to which he could easily get, given by men sent out by the larger schools.

8623. I was referring more to his general education ?—Well, I do not know—looking around and thinking of the men who have done best in agriculture all through the last five and twenty years, which, as you know, have been extremely trying years, I am bound to say that the men who have done best have been the men who have had a sound education and went on to their fathers' farms at the age of about 16, and stuck there. I doubt very much whether secondary education, speaking of an ordinary farmer's son, is necessary. Of course if you had got a particularly sharp lad who was capable of going ahead, by all means let him have the opportunity of going higher.

8624. You have a certain number of secondary schools in your district ?—Yes.

8625. I suppose a large number of farmers' sons go to

those schools ?—Yes ; at Reading, for instance, there is a very excellent grammar school with very low fees, and at Henley also there's a very good one.

8626. You have a suggestion as to boarding out agricultural students with practical farmers approved by the county councils in their respective districts. You are of opinion that a considerable portion of the money now devoted by county councils to agricultural education would be far better and more profitably spent in that way ?—Yes. I do not know whether that is possible, I have never heard it advocated, but what I feel about it is this : if I take one or two pupils I can teach them something, but if I take a dozen I can teach them very little. If a farmer has got charge of one or two pupils the pupils can always be at work where the farmer is, and he has every opportunity of teaching them their business. They would learn more on a farm like that under a good practical farmer in one year—for of course they must be there for a year—than they would learn in an agricultural college, from a practical point of view, in three years.

8627. That is done occasionally now, is it not ?—I do not know of it being done publicly.

8628. Privately, I mean ?—Yes, it is frequently done privately. Three or four of the best tenants I have have sent their sons out in that way, and I frequently get applications from tenants asking my opinion as to whom they should send their sons to.

8629. A public authority might have some difficulty, might it not, in selecting good instructors ?—No, I do not think the county councils would have the slightest difficulty in that respect, because you have men who know everybody in the county on the councils, and I do not think there would be the slightest difficulty.

8630. How would you select the pupils ? You would not give scholarships to everybody who came along ?—No. I am afraid I have hardly thought it out sufficiently to answer that question with care.

8631. (By Lord Moreton.) Have you ever thought whether anything could be done besides teaching the young farmer as regards giving the labourer a chance of working himself up a bit—I do not mean to make a man of science of him, but to give him a sort of smattering of knowledge which would make him a better herdsman or stockman, or even foreman perhaps ?—Yes, that is a subject I have taken very keen interest in. I have for years past run a little society where we offer prizes every year for good work in the way of hedging, ditching, rick-building, thatching, and ploughing, and to shepherds for the best results from their flocks, and herdsmen and so on. In this little society, which I have absolutely worked myself now for 20 years, we give valuable prizes every year for that kind of thing, and it has had an excellent result in our district.

8632. Does that affect the younger men who are coming on or the men who are actually at work ?—I am glad to say now we are getting much more interest taken in it by the younger men. We had rather a slump for two or three years ; we had great difficulty, for instance, to get young fellows to enter for the ploughing, but during the last two or three years we have had much better entries, and there is a greater indication of a desire on the part of the younger labourers to take an interest in their work. It is difficult to get young lads now to make a hedge, or to thatch a rick, but I think, if inducements could be held out to them to take an interest in good work connected with agriculture that a vast amount of good might be done in that way.

8633. In the case you mention I take it it is more a question of encouragement than of instruction ?—Yes, but of course the encouragement produces the instruction to some extent.

8634. Would you tell us how ?—The farmers themselves take a keen interest in the Society, and I think they look after their men rather better than they used to do, and instruct the men more themselves. They all take a very keen interest in it.

8635. The agricultural labourer, in fact, understands that he can better his position by marching with the times and getting what education he can on the subject ?—Yes.

8636. I should rather like to know how you encourage the herdsmen. I know how the shepherds are encouraged ?—I think perhaps when I included herdsmen I used a term that I should not have used. I do not think that we have a class for herdsmen. Of course the shepherds are judged by the number of lambs they produce from their flocks by a certain day.

8637. In a dairy district it would be an advantage if you

Mr. W. A.
Simmons.
18 June, 1907

could give prizes for operations in connection with the raising of horned stock, would it not?—It would.

8638. Have you had any experience of any farriery work being carried out in your part of the world?—No, we have not.

8639. As regards book-keeping, which you mentioned just now, I entirely agree with what you said, but I suppose the book-keeping you would advocate being taught would be essentially of an agricultural kind, and not the usual commercial book-keeping?—Exactly. The mistake is in trying to make it too complicated. For instance, I have ruled up a book myself which we use on a great many properties we manage ourselves, and which is absolutely simple, and yet at the same time will give you any information you want to know.

8640. I daresay you know the kind of form the farmer has to fill up for income-tax purposes?—I do.

8641. If a farmer had sufficient knowledge to fill up such a form as that properly, that would be sufficient for book-keeping purposes?—Quite.

8642. (*By Mr. Latham.*) I think it would be very difficult for you and me to get very much abroad on the subject of practical farming?—I think so.

8643. At the same time you would not object to a man having a little scientific education?—No; I think it is highly necessary.

8644. To what extent do you suggest?—I think a man ought to possess a sufficient knowledge of chemistry to be able to know what sort of manure would be good for any particular soil and so on. I think the mistake is to try to make an agricultural student a chemist; they go through such an extensive course of chemistry which would be all very well if you are going to be a chemist, but which is quite unnecessary for a farmer's life.

8645. I think the Committee may take it from your evidence that you are not altogether against allowing a man to have some scientific training if practical farming was kept in the foreground?—Certainly not.

8646. You and I made a very instructive visit two or three years ago to Mr. Prout?—We did.

8647. Do you not think most of us learned a good deal down there?—You learned enough to induce you to try to imitate what he is doing—at least you made an application to me as your agent to be allowed to farm a portion of your farm as you liked, which I at once gave; I do not know that the result was unsatisfactory.

8648. All I can say is I never saw corn looking better in my life than mine did yesterday when I went to have a look at it?—It depends very much upon the soil. If we were to try to practise Mr. Prout's system on the hills or light soils in South Oxfordshire, we would be in the workhouse in two or three years.

8649. But do you not think we found it generally a very instructive visit?—Yes.

8650. He is farming on scientific lines?—Certainly. It is his knowledge of manures and what kinds of manures to use on certain soils that has enabled him to acquire that success.

8651. So far as Mr. Prout goes you would like agriculturists generally to have such knowledge?—Certainly; that is the kind of chemical knowledge that I think a farmer ought to possess.

8652. It is difficult for him to get that knowledge unless he is in touch with some scientific centre?—Of course you have one great advantage in these scientific centres, that you give every farmer the opportunity of ascertaining those things. If he is not capable himself, by applying to these colleges he could have a man sent there who could tell him what is the best thing to do and the best manure to use on certain soils and so on.

8653. You know exactly the terms of reference to this Committee?—Yes, I have the terms of the reference before me.

8654. If these opportunities were offered to the farming class generally, whether they are large farmers or whether they are small farmers, if they were to take it on the lines which should be offered to them it would be very beneficial to them?—Certainly.

8655. With regard to the lectures, as to which I agree with almost every word you said, especially as to the lectures which were delivered in Reading last autumn, no doubt they were very beneficial to the farmers?—They were most beneficial. I have heard a great many farmers say that they derived great benefit from them.

8656. On those lines alone if they were carried out you consider it would be very beneficial to the agricultural interest?—I do.

8657. Are you not willing that there should be much more of the money that now is in the hands of the county councils allocated to the agricultural interests?—Certainly.

8658. What is your objection to the expenditure of the money that has been spent on bee-keeping?—I doubt very much, as I say, whether the result justifies the expenditure.

8659. Have not a great many agricultural labourers and cottagers benefited very much by the teaching of bee-keeping?—I do not say there has not been a certain amount of benefit, but it always has appeared to me, like poultry farming, that there has been more money spent with regard to the teaching of such things than is altogether justified.

8660. I could name a great many instances now where cottagers produce large quantities of honey, and one I know in particular who produces more than 100 lbs. of honey a year, and if they can make 10d. a lb. out of it, it helps to bring in an income?—Yes, I do not deny a certain amount of instruction, but I cannot help thinking that there has been more money spent in that way than the result has justified.

8661. I suppose the remark and the feeling generally is that it often takes more to teach those things than the outcome justifies?—I suppose it does.

8662. With regard to the cottagers' gardens and the gardens attached to the schools, do you not think that there has been much good done by teaching?—Yes, but I will tell you what I think with regard to that; that a system of offering prizes for good gardening would have an equally good result.

8663. One follows the other you see. We have been offering prizes at our shows for the best cottage gardens and they have been very much improved by the lectures?—In the district I was speaking of we have classes as you have seen for yourself, for good gardening amongst the cottagers, and it is marvellous what they produce, but in our particular neighbourhood we have had no instruction at all, and I have had an illustration there of the benefit of offering an inducement to cottagers to produce good results.

8664. I quite agree with what you say about that society who have done me the honour of asking me to judge for them for a good many years, and I agree that there would be a good deal of good to come from it, but that never can be brought under the Technical Education Act?—I have made applications to the county councils more than once and I fail to see why the county councils could not allocate a certain amount of money every year in the direction of giving prizes to the farm labourers and cottagers for good results in their work.

8665. We are always told they cannot do it?—Yes, I know; that has always been the answer I have received but I do not see why they should not do it. I am quite sure it would have excellent results if they did.

8666. That would improve the status of the labourer?—It would improve the status of the labourer; that would be the result of it, of course.

8667. Do you consider the general education of the ordinary farmer's son is sufficient?—I think the ordinary grammar school education is quite sufficient to fit an ordinary boy for a farming life.

8668. Without any scientific knowledge?—He should obtain a certain amount of scientific knowledge afterwards.

8669. Speaking of the ordinary courses, do you not think that they only give a smattering of knowledge and do not go scarcely far enough?—No, I think if they were judiciously arranged that a young farmer would be able to learn, taking an ordinary course, practically as much as he would be required to know to conduct his business.

8670. Knowing you so well, and knowing what a practical man you are, I would be glad if you would kindly tell us what that little should be?—I have already said the kind of education from a chemistry point of view that I would advocate, and with regard to botany for instance a boy should be thoroughly taught all the different grasses and plants, I am rather inclined not to throw the net too wide. I think every farmer, of course, ought to possess an elementary knowledge of veterinary science. I mean to say such a knowledge as would enable him to deal with any simple case.

8671. In the nature of first-aid?—Exactly, very much

Mr. W. A.
Simmons.
18 June, 1907

that kind of education ; up to the point at which first-aid is given to those who are taught it—the police and so on.

8672. Are you in favour of demonstrations and experiments being carried out in the county?—I am strongly in favour of demonstrations. When I was agent to Mr. Sutton at the time he was farming a good deal, we had excellent results from the experiments we made with different manures on the same crop of grass. We used to take part of the park or part of an annual grass and set it out in quarter-acre lots and apply different manures to them and then invite the farmers to come and see the result. I am quite sure that resulted in a great deal of good.

8673. That to a certain extent you would call scientific education?—Of course—that is scientific education.

8674. You are not against farm pupils if they go to practical farmers?—No.

8675. You think that would be a very great advantage?—Certainly.

8676. It is not altogether satisfactory that a son should be brought up in the hands of his father?—No, I advocate a boy getting away. It is far better for a boy to go on to another man's farm; he gets new ideas. There is too much an idea on the part of farmers to do very much as their fathers did, without ever questioning whether it is right or wrong.

8677. Would you advocate scholarships being offered by the County Councils to farmers to take these young lads?—Certainly I would.

8678. After they have been there for two or three years, would you object to their getting a little science before beginning business for themselves?—No, that is just what I think they want. If a man had two or three years with a good practical farmer and then had a chance of attending a course at such a school as Basing, I think he would be well on his road to becoming a successful farmer.

8679. You have almost forgotten the great improvement in horse shoeing that has taken place in your district when you say you have not much knowledge of farriery?—It so happens I have not had much to do with that. I was speaking from a personal point of view.

8680. But still you do know that a great deal has been done in the way of farriery instruction?—Yes, the prizes given for shoeing for instance have had excellent results.

8681. The county councils help that a good deal?—Yes, I think that is a most important part of the work.

8682. (*By Dr. Somerville.*) You are rather down on bee keeping. As a matter of fact do you know what an insignificant sum is spent annually by the county councils of England and Wales for instruction in bee keeping?—I am afraid I do not.

8683. Would it surprise you to find that the sum has never reached £1,300 a year during the last five years in the aggregate for all the county councils of England and Wales?—I am surprised to hear that; I thought it was much more.

8684. I would also call your attention to the actual figures in regard to what is expended on agricultural education in colleges. I think you said that the total sum was about £100,000?—Something under £90,000.

8685. As a matter of fact it is about £90,000. Then I think you said that about £40,000 was given to the colleges and schools, whereas it has only once reached £30,000 during the last five years, and it is now about £26,880?—I was speaking from memory; I thought it was more.

8686. It has often been said that the presence of large numbers of bees in clover fields is disturbing to the farmers' stock. Do you think there is anything in that objection?—I have never heard that.

8687. So that you would not discourage the keeping of bees by the labourers through any fear of the farmers being injured?—No; and I would encourage the labourers to do all they could to increase their position and to better themselves from a financial point of view. I think the whole secret of keeping men on the land lies in that direction.

8688. With regard to farm book-keeping, I think most people are agreed that farmers might in many cases keep more accurate books, but partly the lack of knowledge and partly the trouble involved seems to deter them. Might I explain what is done in Germany and possibly in other Continental countries and ask you whether with your knowledge of farmers and farming you think some such system might be adopted in this country. The Agri-

cultural Society of Germany, which corresponds to our Royal Agricultural Society has a section which is called the section of book-keeping, consisting of expert book-keepers and valuers, and the Society asks its members to supply that section with the actual figures referring to the expenditure and receipts on their farms, and the Society keeps the books for the farmers, and at the end of every year, gives them a true statement of their financial position. That has been imitated by private firms also in Germany, and it is not uncommon for private firms to have their books kept by farming accountants. Do you think our British farmers would regard such a suggestion as that with sympathy and would be prepared to supply some central authority with the figures and allow their books to be kept for them?—No, I do not think they would for a moment. I am perfectly certain they would not.

8689. Not even if the figures were given to a thoroughly reliable and reputable society that might be depended upon not to allow the figures to go outside the office or beyond the individual keeping the books?—No; I am afraid you would never get the ordinary farmer to believe that those figures would not leak out somehow or other. They are very suspicious about their own accounts.

8690. Does it surprise you to know that a land agent a little further west than yourself and in a large way of business does, in fact, send the figures relating to the farms under his charge to Germany, and gets an expert there to keep his books?—I am rather surprised to hear that, and it seems rather a strange thing from a land agent's point of view.

8691. (*By Mr. Medd.*) In speaking of the lack of practical instruction you were referring I suppose mainly to the big collegiate centres—such as Newcastle, Leeds, Cambridge, Wye, Reading, and so on?—Yes.

8692. Do you think it is practicable to combine practical instruction with the scientific instruction at such institutions?—I do not.

8693. That is the difficulty. Experience shows that you cannot combine the practical and the theoretical work at an institution of that sort?—I quite agree with that.

8694. I do not know Scotland at all, but I have an impression that the majority of their students have been on a farm before they go to a college. Do you know whether that is the case?—I do not know whether that is so, but that is what ought to happen.

8695. Or possibly you may think that any one of these institutions before granting its diploma should insist that the student after completing the college course should pass a year upon a farm?—I think he ought to go to a farm first.

8696. That is, I believe, the best way.—Yes.

8697. In the case of the class of men who attend these colleges it would be very difficult to enforce residence on a farm to begin with, because many of them go for a variety of reasons, and you are not dealing with them as farmers. Do you not think that all your complaint against agricultural education as given to-day comes from want of organisation; that there are too many gaps; in other words that nothing or little is done for the labourer and the small farmer?—Yes, that is so.

8698. That these institutions cater for the large land owner and men of that type mainly?—Yes, and for land agents.

8699. Yes, men who are going to become surveyors or land owners, much less than for those who are going to become actual practical farmers?—Very much less.

8700. You have spoken of Basing?—Yes.

8701. I take it you would like to see a number of schools of the type of Basing?—I would.

8702. Those are what we term technically intermediate schools?—Yes.

8703. Where the instruction is very much more practical than it possibly could be at a collegiate centre. When the witnesses from Hampshire were here they expressed their readiness to enlarge Basing and make Basing the intermediate school for the group of counties centred round Reading. Would you be prepared to support that?—I would.

8704. The difficulty is this: that each county, with the difficulty that they have of obtaining money to-day, would be unable to establish and maintain an institution of that sort of itself. There is such a centre in Cumberland

and yours might be developed at Basing. You would be prepared to support such an institution?—I should. I should think it would have excellent results.

8705. I hope you will establish one. You would have Basing as the intermediate school and the best pupils would move on from Basing to Reading if they had means to do so?—Yes.

8706. Of course, as you know there are a large number of boys who are engaged in farming whose education must necessarily close when they are at 17 or 18. They cannot go on any longer?—That is so.

8707. With regard to short courses, what would you consider the maximum time that a lad should attend for?—I think it ought to be for about three months.

8708. You might do it for rather more, might you not—for about 21 weeks. That is a thing that is, practically, non-existent in England, and you might advocate for twenty to thirty-five weeks, say, at such an institution as Basing, not at such an institution as Wye or Reading. The grade there, I imagine, you consider to be distinct and too high?—Yes.

8709. I quite agree with you. Now in regard to the fault you find with bee-keeping, does not the objection rather arise from the want of organisation in the lectures? You do not object to bee-keeping as such; what you object to is the spasmodic lectures that are given and the ready money which is frittered away here and frittered away there and the lack of system?—There is no doubt it is the lack of system that has caused what I complain of.

8710. You live in Oxfordshire?—Yes.

8711. I hope your counties will in future annually meet and devise a scheme to cover the whole of your area so that that lack of system may be obviated. I may say that the witnesses we had here from Reading and Hampshire were quite prepared to do that. With regard to the boarding out and apprenticing of good lads, have you ever known where that has answered well?—Yes, one of our tenants has had pupils for the last 15 years and they have done very well indeed.

8712. The weight of past evidence seems to show that as a system this breaks down, although it may succeed in individual cases, that is where you have a satisfactory lad and a farmer whom you know and can trust. Have you read Mr. Jenkins' Report to the Royal Commission, Technical Instruction, 1884?—I have not.

8713. Or the evidence given before the Irish Recess Committee?—No.

8714. My impression is that apprenticeship cannot be relied on. You do not happen to have read the reports referred to?—No, but I should be very strong about not allowing a farmer to have more than two pupils at a time; directly you get more than two pupils the chances are they will not learn anything like they would if there were only one or two.

8715. And, of course, you would take special steps to see that the farmer was a man who was personally known to you, and in whom you had confidence?—Yes. The class of men who advertise for pupils, for instance, as a rule are the very last men who ought to have them.

8716. Quite so. You have done a great deal in Oxfordshire for the promotion of the cultivation of allotments and gardens?—I have tried to do so.

8717. I think, through the County Council, there are prizes given and shows held periodically?—Yes.

8718. And a considerable amount of work in that direction has been done round Banbury?—I believe so, but I have had no personal experience of it.

8719. I was going to ask if you could give us any information with regard to that?—No, I am not in the neighbourhood of Banbury. I have a good many acres let out in allotments there, but I have no personal experience of what has been done at Banbury, and I cannot give you any information.

8720. What has been done to stimulate them, by way of shows and prizes?—No, I cannot give you any valuable information on that point.

8721. (*By Lord Barnard.*) You told one of the members of the Committee just now that the courses in chemistry were too extended. I suppose you were thinking of some particular institutions and not of others?—I was thinking more of what takes place at Reading and Wye.

8722. That does not apply universally?—No.

8723. There are institutions such as the Basing School where you would not consider it is too extended?—No; I think the Basing course is just what is wanted.

8724. I see in the Government Report here that the subjects at Basing include sciences relating to agriculture, and in the case of a somewhat similar school at Newton Rigg in Cumberland, farm chemistry is one of the subjects; the composition of air, water, soils, soil food of plants, manures, and so on. That requires to be taught by a man who has had considerable scientific training?—Yes.

8725. So that in order to supply teachers of that description there must be some teaching in chemistry given somewhere?—Yes, but it would only be at places such as Wye and Reading that you would want anything like such an extent of instruction in it.

8726. So far as your experience, derived principally from the Basing School, goes, in the case of working lads there you think too much chemistry is not taught?—I do not think it is at Basing.

8727. I should like to ask you to explain a little further what you said about Mr. Prout's experiments. You said it would never do on the light soils of South Oxfordshire?—That is so.

8728. Should it not be one of the objects of instruction in scientific agriculture to apply the necessary science and knowledge to the varying soils with which you have to deal, having regard to climate, aspect, and so on?—Certainly.

8729. It does not follow that because Mr. Prout's system would not do in South Oxfordshire that you should not have any scientific application of knowledge?—Oh dear no, I thought I had made it plain that up to a certain point a farmer should have scientific education.

8730. Then as to the demonstrations and experiments to which you alluded, would you not agree that it would be a good thing that those should be carried out by experts at higher colleges like Reading?—Yes.

8731. In order that the information obtained by purely scientific men might be available for practical men?—Certainly, I think that would be the proper way of carrying them out.

8732. I do not know whether you are one of the Correspondents of the Board of Agriculture?—I am not.

8733. Do you know anything about them?—No.

8734. Have you any opinion as to their usefulness?—I am afraid they are very often men who do not know very much about the practical side of the question.

8735. Do you know any of them in your district?—No, I do not. I have often wondered who has supplied the information one sees in the paper.

8736. Dr. Somerville asked you a question about the figures in this Report?—Yes.

8737. This is a Report which should be in the hands of gentlemen like yourself who take a great interest in this subject. Perhaps you do not know of it, do you?—I am afraid I do not.

8738. Would you agree with me that the principal part of the duties of an Agricultural Correspondent should be to bring this and the numerous other publications of the Board of Agriculture to the notice of those interested in agriculture?—Certainly.

8739. To conclude I would ask you whether the opinions you have put forward represent your own individual views or whether they represent not only your own views but the views of those people with whom you have come in contact in your neighbourhood?—I believe they do. My views are based on my general observation and on what I have heard farmers say. I am constantly in touch with farmers and talking with them on all the subjects of the day, and it is upon that frequent intercourse with them that I have formed the opinions that I have stated here.

8740. (*By Mr. Medd.*) Your objection, I take it, is not so much to the existing institutions, but to the absence of institutions suitable for the small farmer?—Yes.

8741. (*By Mr. Latham.*) With regard to the institutions that have been talked about, do you not consider if there was a farm attached to them it would be of great value?—Yes, but it would have to be a big one; I do not think a small farm is any use. Take the one at Reading, for instance, you cannot teach men farming on 150 acres of land: I think that is about the size of their farm?

8742. I was more particularly speaking of the scientific part of farming—of a farm where experiments could be

Mr. W. A.
Simmons:
18 June, 1907

Mr. W. A.
Simmons.

carried on?—You certainly must have land where experiments can be carried on. All colleges should have that, but it is impossible to teach young men farming on a farm of only 150 acres.

8743. We have had before us a very large number of land agents and surveyors and people who had got a good deal of beneficial knowledge from scientific institutions. Is that your experience?—Yes.

8744. You would not favour that sort of institution for

people who were going to be farmers?—If my son were going to qualify for a land agent, I should certainly send him to either Reading or Wye, or one of the other colleges for a year. The education you get at Wye and Reading and such places is far more likely to enable a land agent or land agent's son to qualify and to know how to look after property than to be of use to the ordinary farmer. You do not get at the ordinary farmer and particularly the small farmer with these big institutions.

Miss EDITH BRADLEY, called and examined.

Miss Edith
Bradley.

8745. (By Lord Barnard.) I do not know whether you are acquainted with the terms of reference to this Committee—no doubt you have had a copy of it?—Yes.

8746. Therefore you know what it is we are enquiring into?—I do.

8747. I understand you are prepared to kindly give the Committee your views on the subject of agricultural education for women. You have taken a great interest in that subject for a good many years past I think?—Yes, I have for ten years.

8748. Have you actually practically been working at agriculture?—No, not actually doing the work, but I have been organising it for other people.

8749. You are not a mere thinker on the subject, not an abstract reasoner?—No, I am quite a practical person—and have been from the beginning.

8750. Perhaps you will kindly inform the Committee, as briefly as possible, what the work actually is with which you have been personally in touch?—I was for seven years Warden of Lady Warwick Hostel and of her College when it was moved to Studley Castle; and I had the privilege and pleasure of initiating the scheme under which the Hostel was founded—"the Agricultural Scheme for Women." I resigned just about two years ago, and since then I have continued my interest in agriculture, although watching it more from the point of view of village life, and farmers' and market gardeners' work and interests.

8751. I should like to ask you if you would kindly tell the Committee what opinions you have formed as to the work done by the Warwick Hostel—what the value of it was to the public?—I think it was very valuable work indeed; I have every reason to think so, as I hope I shall be able to show you from the results which I have; and also because I think that it was the association of women in the work of agriculture which brought it so prominently before people, not only in England, but on the Continent and in the Colonies. We had a magazine which ran for seven years which was devoted exclusively to this subject of Women and Agriculture, and although its circulation was of necessity limited still it was a fairly wide one, and those who took the magazine read it with great interest. Therefore I think that the founding of Lady Warwick Hostel certainly gave a great impetus to the work for educated women. That was the object of it of course, much more than for the less educated women.

8752. Are you in touch with any of those women now?—Yes, a number of them. I sent out a circular to between 80 and 90 of them only the other day, all my old students.

8753. Can you give the Committee one or two instances of women who are practically now reaping the benefits of agricultural education?—Yes, I have several here, and they are quite up to date, because I only received them within the last few days. I really sent out a circular letter in the hope that I should get responses from many of them who might wish for small holdings. I sent out two forms, one of which was to ask if they wished for a small holding, the number of acres which they proposed to cultivate, and what they could pay for rent; and the other form was for those who were already engaged in the lighter branches of agriculture. I have had ten forms returned to me filled in, which are of a very interesting nature. I did not tabulate them altogether before I came because I was not sure that that would be what the Committee would wish.

8754. I do not think we need go into the question of those who propose to take up small holdings because that is a very wide question, and rather touches another branch of agriculture. Perhaps you would mention one or two

who are actually working for themselves now. You need not give names unless you like?—That is of course just as you wish; I shall be very glad to give them. There is one who has a market garden at Cosham, in Hampshire, who has three acres of ground under cultivation and seven greenhouses; she works as a market gardener or nurseryman (or nursery woman) and she has made her work a substantial success.

8755. Did she put any capital into it?—Her father did, and she now has three sisters who have joined her. They have become one firm and are really doing very well.

8756. Is that a typical case?—Yes, I should say it was quite a typical case, because this girl was the first of my students who started for herself. When she first started she had a great deal to put up with, because she was practically boycotted by the tradesmen, so much so that they would not even allow her van in the market at one time, but she was a girl with considerable "grit" and stuck to her point, and now she is recognised as a practical market gardener.

8757. (By Mr. Medd.) Is not this lady in the habit of taking pupils. She has seven pupils, has she not?—I think almost all the ladies whose names I have here supplement their work by taking pupils.

8758. (By Lord Barnard.) Could you give the names of one or two who are subsisting purely on agriculture, that is market gardening, or any kindred industry, and who are not subsisting, or even partially so, with pupils?—I have one or two, but I must admit 8758a that they are very rare, because there is an uncertainty about the work being a financial success, and therefore they start at the very beginning by trying to get pupils to ensure making ends meet. But I have one here, a girl living in Cheshire, who has a garden of an acre. She cultivates that with fruit, vegetables and flowers. She has 60 ft. of glass, and she considers that it is a financial success—she has only been doing it for two years—because she says that she saves the wages of an experienced man, and also has pocket money for herself. There is another one who is working in Bucks. She has three acres under cultivation, and her particular work is in fruit, carnations, and small shrub propagation in cold frames only. She does not consider she has started long enough to say that it is a financial success, but she was very successful in another part where she started, but unfortunately it was a sub-lease, and she was turned out after she had built up her work and made it pay. Hitherto the results have justified the experi- 8758b ment, but I think if they are to go on justifying it, it certainly would be necessary, as I put in my synopsis, that the agricultural education for women should receive a definite place in the school curriculum, beginning from the elementary schools; now it is taken up by women as a kind of afterthought, and many of those who came to Studley and Reading were educated women in the ordinary sense of the word, daughters of professional men, but they had an absolute ignorance or a great ignorance of the ordinary way of writing an examination paper, putting things together, and work of that kind, which of course is most essential if they are to take up the work from a business point of view. All those things, business correspondence, business methods, and of course book-keeping, are most essential.

8759. If you were to tell that to the Board of Agriculture might not they say: "That is a matter you should tell to the Board of Education and not to us?" Lord Moreton suggests it might be interesting if you would tell us the class of schools from which those girls come?—Generally speaking, from private schools or secondary schools.

8760. In spite of that you say their preliminary education in the way of writing examination papers and so on

is not very good?—No, not at all good, and I might even say that the spelling is sometimes doubtful.

8761. I gather from your synopsis that you think education in agricultural subjects should be included in the curriculum of every elementary school?—Yes, elementary rural schools at any rate; perhaps I should have put that in.

8762. What inference is the Committee to draw from that?—I would like to say that I think, considering that agricultural education for women hitherto has been paid for and organised by private individuals, the results which have been obtained are very satisfactory, but that if it were looked upon as a definite side of a girl's ordinary education, provided she wanted to take it up afterwards, that the results would be more satisfactory from every point of view, and it would receive more serious attention.

8763. I can understand that from a purely educational point of view it might be very desirable that the elements of what we call nature study should be taught at elementary rural schools, and also in the high schools, but I do not quite see what you could suggest would be of advantage to the agricultural community of that education. Would it enable women to be better off financially than they are without it?—I think it would, because I think if they had this kind of education when they were girls, then when they come to one of these agricultural schools, instead of having to go back again and learn so much of the elementary part, they would be able to take full advantage of the practical and theoretical work in the subjects in which they have come for instruction.

8764. I can quite understand the point you mention of the desirability of the university degree in such subjects being open to women, because they might become specialists or scientists—there is nothing to prevent that?—No.

8765. But I can hardly appreciate the necessity of it in public elementary schools or high schools, unless you can satisfy me that there is a great benefit to be gained for women as practical agriculturists or gardeners?—I think that there is, and I think the opening is enlarging every year, and why I made a point of it with rural schools is because it is so difficult to get the ordinary elementary teachers to take the least interest in rural things. I myself tried this year to establish school gardens in my own village, and I got no assistance from the school teacher because she was not interested in school gardens, and it was very difficult, of course, in fact it proved impossible afterwards, to get the requisite number of children to take it up. But it seems to me if it were recognised in the curriculum of a rural elementary school the children would become accustomed to it from the first, and we should get teachers who would help on rural education, which is one of the things which are so necessary, is it not, instead of being outside it altogether.

8766. I do not know whether you know we have been told by some witnesses that the curriculum in the training of elementary teachers is now so overcrowded that it would be impossible to put in another subject unless you knocked something out; perhaps you are prepared to suggest some other subject in which they are trained at present that might be left out?—I think with regard to rural teachers that there are several subjects that might very well be left out.

8767. I think you have some suggestions to make as to Dutch market gardening schools?—I have.

8768. Have you studied the subject?—Yes, I have, and I have read a great deal about it. I have here a pamphlet issued by the Board of Agriculture on the Dutch Brined Vegetable Industry, and there is a very excellent suggestion in that report about the Dutch market gardening schools, which I venture to draw your attention to. I do not know whether anyone has the pamphlet, but the school is established for teaching market gardening, and the students receive three years' instruction; they seem there to try to arrange the courses of instruction to suit the districts in which the schools are situated, which seems to me a very valuable point. The object of these schools is to enable market gardeners, those who are intending to take up market gardening as a livelihood, to obtain the necessary theoretical knowledge at the least possible expense. They also have the winter courses at schools, which I think would be most helpful for boys and girls who are taking this up, because of course they are wanted on the farms in England in all their spare time during the summer; the fees in the Dutch school are very low. The buildings in one at Boscoop, which is a winter school, and also the land, were provided by the local authorities of the district, and

the garden attached to the school is nearly two acres in extent; there are seven glass-houses, and about 100 frames, and the students have an opportunity of working in market gardens in the district, which also occupy about 1,000 acres. I am very glad to find that great importance is attached to the commercial training of the students in the commercial aspects of market gardening, and in the syllabus which is printed at the end amongst a lot of other subjects, I would venture to point out these subjects which are of general interest to gardeners, sale and purchase associations, credit institutions, co-operative sale and purchase of produce, and so on. I am sure that those would be most important for people to understand, and especially women, because they have really no business training as a rule. The other subject which I would point out is called commercial correspondence and arithmetic, and it includes drafting of letters, receipts, circulars, commercial reports, filling up invoices, quantities in English, German, and French, commercial arithmetic, foreign weights and measures, mental arithmetic, business correspondence, commercial geography, commercial intercourse between Holland and the other countries, and the simple book-keeping of a market gardening business over one entire year.

8769. Have you seen these Dutch market gardens yourself?—No, I am sorry to say I have not. In view of those suggestions I would certainly urge that co-operation should occupy first place in all these schools; even with the groups of school gardens it seems to me that it would be possible to form a toy co-operative society amongst the children. They might be grouped together; the children could become shareholders, even if the shares were only 1s., with 6d. paid up, and they could have their own secretary and treasurer, and be taught to conduct their business meetings properly, and to bulk their orders for seeds, sales, and manures, and so on, and in that simple way they might learn the elements of co-operation, which from experience I have found is most difficult to teach to girls or women afterwards. I am afraid they are terribly individualistic and not at all in favour of co-operation, because they do not see the necessity for it; if it were taught in this way, not only in elementary schools but in secondary schools, I believe it would help on the whole system of co-operation immensely, co-operation being considered the one thing necessary in agriculture. I must not claim originality for that suggestion; it was made to me by Mr. Nugent Harris in talking over the practical work of co-operation, and it seemed to me a very valuable one.

8770. You are of course aware of the existence of the Agricultural Organisation Society?—Yes, I have been a member of that for many years; Mr. Nugent Harris is the Secretary.

8771. It is doing very good work?—Excellent.

8772. I am not sure that the question of the teaching of co-operation is not a little outside the exact subjects before this Committee. It certainly is not scientific instruction, and I scarcely think it could be called technical instruction in agriculture?—I thought it was included in the technical subjects now—I think so.

8773. You say something here as to the necessity for organisation of students before they leave college. Is that in the nature of a students' association?—Yes, or in the form of an organisation so that when they leave they may know that they are not going out into the world as isolated units, but that they may have some organisation which may help them in settling into their small holdings.

8774. You are speaking of women, of course?—Yes, I am now—so that they can have the help of other people.

8775. You do not think that numerous people will become small holders, do you?—Yes, I do. I think that if the Bill passes a great number of women will become small holders because I know of a great many other students who will be only too glad to take up this work if it were made possible for them.

8776. It is rather foreign, is it not, to the feeling of this country that women should be employed in hard manual labour?—I hope it is, and I hope it will always remain so, but a small holding of half an acre or two or three acres would not entail very great manual labour. I think, under the new Act it is called an allotment up to five acres, but that is rather a new distinction. Of course, 50 acres is a great deal for a woman to undertake unless she is going in for farming, but, certainly, I would not wish them to do ordinary field work. I think there is so much other work that they can do, for instance, in the way of French gardening under glass, that there are endless openings for them which would not entail the doing of hard manual labour.

Miss Edith
Bradley.

18 June, 1907

Miss Edith
Bradley.

18 June, 1907

8777. France is better off than we are in the way of climate, is it not?—I hope it has been lately.

8778. Surely a system of cultivation on the lines of the French gardening system could hardly succeed in England as well as it does on the Continent?—The French gardening system, of course, has only been started here for two or three years, but I think the difficulty which was anticipated by a number of people owing to the climate has not really been found a difficulty at all, because even down in the coldest part of Essex the other day I saw it in operation at Mr. Fels's settlement, and he was thoroughly satisfied with the results of it.

8779. To sum up your opinion, you think that more women will, in the future, be anxious to cultivate little bits of land, and that in order to enable them to do that with any prospect of financial success they ought to have greater advantages in agricultural instruction?—Yes, I do.

8780. (*By Lord Moreton.*) You think there is a considerable opening for women to take up portions of land of varying sizes and make a living upon them?—Yes.

8781. Is that founded on practical experience, or what you think may be the case?—It is really founded on practical experience.

8782. You spoke just now about the absolute necessity for definite and recognised inclusion of co-operation in theory and practice into our elementary and high schools, as well as our agricultural schools and colleges. Who would attend to them in the rural elementary schools. Would it be the schoolmaster?—I presume the county council has teachers who give lectures and instruction in co-operation.

8783. (*By Mr. Latham.*) Were you Lady Warwick's first Warden at Reading?—I was.

8784. You went from Reading to Studley, and afterwards resigned?—Yes.

8785. Can you give us any single instance where any of your students have left and managed their occupation with profit?—Without pupils?

8786. Yes, without pupils—purely from a horticultural point of view?—I have in my mind some who have done it for a short time, but through private circumstances they have not carried it on, not because it did not pay, but because family circumstances prevented them going on with it.

8787. If you cannot make it profitable, it is barely any use to go on with their education, is it?—I think that it can be made profitable certainly, and that those who are now working at it and taking pupils, could make their gardening profitable without the assistance of pupils after a time.

8788. You have, I know, exhibited at several agricultural shows the different things that have been produced at Lady Warwick's College to show the kind of things that have gone on. Has there been much interest taken in what you have shown?—What has been produced at the college, chiefly vegetables and, of course, bottled fruit. We made a speciality of that, and I heard only the other day that last year the College exhibited a great deal of bottled fruit at the Hereford and Worcester Show and sold about £47 worth of it, so I think that shows there was interest taken in it.

8789. I see you point out, in your *précis*, the necessity for agricultural education occupying a very marked and important position in the curriculum of every elementary and rural school, and every high school, with the attainment of a university degree. Do you consider a university degree a necessity for practical agriculturists?—I think that it would be an immense assistance to many, because university women and the more intellectual women, I think I am right in saying, are inclined to look down somewhat upon those who are disposed to take up agricultural work only; they think it is not intellectual enough, and that puts the agricultural women on an inferior footing in the educational world to the university women, and, I believe, more intellectual women would go in for it if they could get a degree and that the teaching would be of a higher nature, and it would be easier to obtain teachers.

8790. I am afraid that is not exactly what I want. I want to know whether you do not think raising the woman to take a university degree would not unfit her for the practical side of agriculture?—No, I do not think so at all.

8791. Should you be surprised to hear that we have evidence very much in support of what I say?—Yes, I am surprised.

8792. Do you think that women, I will put you before

men, if they are taught and allowed to obtain these degrees would be more likely than men equally educated to get a living by agriculture?—I think the necessary education and knowledge which they would have to possess to obtain a degree would lead them to much more thoughtful work, and they would realise more easily than they do now the necessity for a certain amount of scientific knowledge with the practical.

8793. Yes, but I presume you would be quite willing to put the practical a long way before the scientific?—I would have it go together.

8794. Yes, but which would you have to take the greatest share?—The practical.

8795. I am very much afraid you are flying very high when you talk about a university degree for women in agriculture?—Of course, that would only be sought for and desired by the few.

8796. And those the teachers?—Yes, but I think there would be a certain percentage of others who would wish it.

8797. Possibly a good many of us would wish it, but I do not know whether it would be of any use to us afterwards if we have to get our living by agriculture?—Of course, that is an open question, is it not?

8798. You say you do not consider that agricultural training is taken seriously enough by either teachers or students—why is it not?—Because a certain percentage of women go in for it who think that they want to do "something" (they are not quite sure what) and they decide to take a year or two at an agricultural college, and if they do not go all through the course it does not matter. So they just go, I suppose, like a good many men go to colleges, to have "a good time," and when they get there they shirk their work and are always trying to get holidays. They do not take it seriously enough, and in a private college or school which is dependent on the fees of the pupils it is difficult to keep up the standard of the best education as you would wish, because the students are not serious enough in working through the whole course; and two years, in any case, is a very short time in which to learn gardening.

8799. Does not that bring you back to my last question, as to whether the getting of this degree would be of any use at all to the practical agriculturist?—I think, of course, you get the two types of students; those who are in earnest and who take advantage of every branch of the work, and every week's work they can get out of the year. They are the successful ones to whom I can point. You were asking me if I could remember any of the students who were making a success of their work without pupils, and two ladies have just come into my mind. These two have a nursery at Maidenhead, and they have no pupils because they say they have so much to do that they cannot give time to pupils. They have only been established two or three years at the outside, and have been so successful that they have been able to buy a motor-van, in which one of them goes round and delivers the produce.

8800. That is quite true, because I happen to know the ladies you mention, although it is rather unfortunate that you should have noticed them, because they are the only persons we have had placed before us by other witnesses as having been successful. I happen to know these people and I know that what you say is true, but it is rather unfortunate that you should have brought forward the very persons that other witnesses have brought forward. Cannot you think of anyone else?—Not at this moment, without pupils.

8801. You answered my question with regard to the scholars, but you did not answer me with regard to the teachers. What I want to know is why the teachers do not take this up seriously. You say you do not consider that agricultural training is taken seriously enough by either teachers or students. I can understand the answer so far as students are concerned, but it is rather difficult to understand it as regards the teachers?—I meant more especially the students. They are taken at the gardening schools, and are taught what they think they wish to know, but if the student wants to leave at three months or six months or twelve months, they are allowed to do so because heads of the schools apparently have no choice as they have to depend on the students as their source of income.

8802. What is the length of the course that you recommend?—At Studley the horticultural course was two years at least, and I always tried to get students to stay for three, and gave them more responsible work in the college during their third year.

8799a

8803. I think you have a short course?—We had short courses, we were obliged to do that, of three weeks and six weeks.

8804. You end up this paragraph by saying: "Reason for this conclusion. Instances given to prove it." Perhaps you will give us some instances where the teachers have not taken to agricultural training seriously?—I can give you the names of some, but that, I understand, is not what you want. I mention that as an instance, and it is only one of many, where small holders take pupils and have not a properly worked-out curriculum for them to keep to.

8805. I know very well the class of students that you have generally been brought into communication with at Studley Castle. Do you seriously think those ladies will ever become small holders?—I think a certain percentage of them undoubtedly will.

8806. Let us know exactly what quantity of land you think they are likely to apply for?—I think it would be usually for market gardening. A larger proportion have taken up market gardening, although, of course, there would be some who would want a greater amount of land for dairy farming and a few for poultry.

8807. The principal occupation of these ladies would be dairying and poultry keeping. Would they have any glass-houses?—Those who took up gardening would.

8808. What would they grow under glass?—Crops for market, like tomatoes and chrysanthemums, and of course, raising bedding stuff.

8809. Would it be possible to do that in all centres, where the railway accommodation was very bad for instance?—Of course, that is one of the difficulties that one has to contend with, and that is why it is so important to get a place on a good railway line.

8810. Unfortunately railways do not run into all these wild regions, and it is no good to take on market gardens in isolated places?—Within two or three or four miles of a railway station is not an impossible distance at all, and I think there is a good deal of land to be got in different parts of England at that distance from a main line.

8811. Have you ever calculated the cost of the carriage of these goods from the time of leaving the land to the time they get to the market or on to the table?—Yes, I have very often, and I have experienced the difficulties of carriage and marketing generally. That is why I so strongly advocate that any number of small holders should group themselves into a settlement, so that, instead of them each having their own cart or motor, they should send their produce to a depot in the centre of the settlement, and it should all be taken in one conveyance to market; of course by bulking produce one would naturally be able to get better prices. For this reason I have laid such stress on the necessity for co-operation right the way through.

8812. There must be a better feeling amongst ladies than there is amongst men, because my experience is men will not join themselves together to work their business in that way?—I think if you could prove to them that they will get 16s. instead of 12s. out of every pound for their produce by combination they will combine.

8813. That would be a rather large percentage, would it not?—I merely use those figures as an illustration.

8814. It is not an unusual thing for many of us to send out produce into the London markets and scarcely get enough for it to pay the empty packages to be returned?—I know that perfectly well, and particularly when I made the huge profit of three farthings a pot on cabbages myself.

8815. Our Chairman made a remark to you just now about the difficulty of carrying on such work. What do you say to that?—I do not think it would be difficult if it were organised on co-operative lines.

8816. To go back to that point, do you not think it would take an immense time to do it?—No, I do not; because if a group of people would settle down, say, in six houses, in a month's time they would be straight, and in order, and by the time their produce was ready, the arrangements would be made by the marketing depot for marketing the produce.

8817. To go back to another remark of Lord Barnard's in which he asked you in regard to the reference, you know as well as possible that if this Committee is to recommend that extra money be spent on agricultural education we shall have to show it would be used at a profit to the individual?—Yes.

8818. That is why I wish to know whether you can show it would be possible for the individual to get a profit out

of market gardening in this country?—I am quite convinced of it after my ten years' experience and living amongst it. I have studied this question from every point of view, and I am more convinced of it now than when I initiated the scheme ten years ago.

8819. (*By Dr. Somerville.*) Do you know of any cases where such settlements have already been set up?—No, and I do not think there are any.

8820. You must have come into contact with a very large number of lady gardeners during the past ten years?—Yes.

8821. Women, I suppose, would be thankful to get a definite object to work for?—Yes.

8822. Do you find it impossible to organise and secure this in your settlement?—I have not tried hitherto, because, of course, whilst I was Warden of the College, my time was more than fully occupied. But that is, of course, what I am trying to do now.

8823. Have you got the nucleus of an establishment?—Yes.

8824. You have not given an answer to any question with regard to the profession of lady gardeners in private establishments. A great many of your pupils, I suppose, have taken up private gardening?—Yes, a great many. I had letters from two or three the other day saying they were well satisfied with the work, and that they would rather keep to that than take up small holdings. One of my very first pupils wrote to me the other day; she has been in her place for about three years, I think, and she has worked under considerable difficulties, but she is still there and is quite satisfied, and I presume her employers are satisfied also.

8825. She probably has got some assistants to do the heavier work?—As a rule they have not many. They may have a boy or a rough man, but they do not, of course, go into large establishments.

8826. Do they, as a rule, reside in the house of the employer, or have they got separate lodgings?—I think on the whole more live out than live in.

8827. You think that suits them better than fitting them into the establishment?—I think it is easier, and except under exceptional circumstances it is wiser for both sides.

8828. Is there a considerable demand for lady gardeners?—Before I left Studley there was a much greater demand than we could supply, and I believe that is still going on. You probably know better than I do that in the last census there were 5,000 women gardeners in the United Kingdom and 99,000 women farmers. It was a perfectly astounding figure.

8829. (*By Lord Barnard.*) I have the census report here, and I should like to say to you that from my own personal experience in the case of women farmers, they do not generally farm their own farms. They are generally widows of the former tenant, and the farm is almost always carried on by the son. I do not think these figures would lead me to think that 99,000 women had deliberately taken farms?—Perhaps not.

8830. (*By Dr. Somerville.*) Do you think there is a tendency on the part of those lady gardeners to demand more leisure and to demand longer holidays than a male gardener would do?—I think that was more the case when they began, but I am glad to say that is being eliminated from their ideas now, because, of course, entering into competition with men, it is impossible.

8831. They adapt themselves to the customs?—Yes, and of course any work of this kind is very arduous work, and it has to be stuck to, which is one of the things they must do. Those who have succeeded are the ones who have stuck the hardest.

8832. Would 20s. or 25s. a week be considered a fair average remuneration for a lady gardener in a good position?—Yes, 25s. to begin with, and then a rise.

8833. You say they generally live in lodgings rather than assort with a companion and run a small house of their own?—Yes. Sometimes, of course, there may be two, and then they take a cottage, and that is very much nicer.

8834. (*By Mr. Medd.*) Could you, roughly speaking, tell us the kinds of occupation open to women who wish to earn their living after they leave Studley? We have had the gardener on her own account and we have had the gardener who goes to a private establishment, and are there any others?—There is the poultry manager, or the

Miss Edith
Bradley.

18 June, 1907

Miss Edith Bradley. woman who does poultry on her own account ; and there is the dairy woman or cheese-maker.

18 June, 1907 8835. Any others ?—There is dairying and, of course, gardening. Gardening embraces fruit growing as well as market gardening, and then there is the preservation of fruit in various forms, bottled fruit and jam making.

8836. Have any of your ladies gone to large establishments merely to do table decorations in flowers, and so on ? —One or two of them did in the first instance, but I do not think they are doing it now. I do not know of any who are.

8837. The difficulty in regard to an occupation of an outdoor character either when employed by someone else or when working on one's own account, is, in the case of women, that it becomes impossible on the first appearance of age. That is the difficulty which one has to encounter. A sufficient time has not elapsed yet for that to have happened, but one would cease to employ a lady to work out of doors as soon as she became gray. All I want to show is that there are other occupations open to women ? —Yes.

8838. Then of course a number of ladies go to Studley to qualify themselves for life generally ?—Yes.

8839. For reasons of health, and of course also they get a healthier view of life than they would get from mere book learning, and so forth ?—Yes, certainly.

8840. And they admit they are very much the better for it ?—Yes.

8841. Do you cater solely for women who wish to earn their living ?—No, and that is a point, of course, in favour of my argument that it is not taken seriously enough as a profession.

8842. But many men who have not to earn their living go to Oxford and still they take it seriously ?—Yes.

8843. What do you mean by this expression here in your proof that this agricultural training has no admitted status in the educational world ?—I mean that it has no place in the curriculum of an elementary or a secondary school, as far as my knowledge serves me.

8844. But all those places marked on that map are agricultural institutions recognised and subsidised by the Government ?—Yes, they are agricultural colleges.

8845. And you say agricultural education here ?—Yes, but of course I am alluding to the girls specially, and in the elementary and secondary school there is no place in the curriculum for such subjects as theoretical gardening and biology dealing with poultry, pigs and cows, &c., or the chemistry of soils and manures.

8846. I was not referring to that for the moment, but you say in the second paragraph : “ I do not consider that agricultural training is taken seriously enough because it has received no admitted status in the educational world.” That is what I do not quite understand. All these institutions are, as I say, agricultural institutions and Studley Castle has, only the other day, had a new scheme by the Board of Education for its future working as a public institution ?—I am only too happy to hear it.

8847. Then again, take the case of Reading. They have been educating women gardeners now for some time, for a couple of years, at any rate, and receiving, unfortunately from my point of view, grants from the Board of Education and the Board of Agriculture for it. But, however, in regard to this question of agriculture, would not you like to modify your expression a little ?—Certainly, if you think it is not a happy way of putting it. If I have made my point clear, that is all I want.

8848. I do not think anyone desires to see agricultural teaching in any elementary or secondary school. It cannot be given there. It would be out of place. If you want to give agricultural training you must go to a school for that purpose. Then would you not give in the secondary and elementary schools the widest possible nature study ? —Yes.

8849. Probably that is what you mean—familiarising the children from their earliest years up till the time they leave the high school, if they are girls, with every aspect of nature, teaching them to handle it ; teaching them to experiment with it, to observe it and so forth. Is not that what you mean ?—Yes.

8850. Then again, what I should like you to use your influence in is to make it universal. Are you familiar with the High Wycombe School ?—Not of late years.

8851. They do a great deal there. But are you familiar with the Ladies' College at Cheltenham ?—Yes.

8852. Have not you seen their work there ?—Perhaps I should not say I am familiar with it. I have not seen their work on the nature study side.

8853. Our County Agricultural Show opens to-morrow at Stroud, and it is not unlikely that the best exhibit from any educational institution will go from the Ladies' College, which shows it can be done very well, you will agree ?—Yes.

8854. The main point I wish you to inform the Committee on definitely is that, leaving outside the question of women earning their living by market gardening, an institution like Studley turns out many women who are qualified in every respect to earn their living and also that Studley acts as an institution for qualifying women generally for life ?—Yes, certainly.

Mr. ALFRED HOPKINSON, LL.D., K.C., called and examined.

Dr. A. Hopkinson. 8855. (By Lord Barnard.) You are Vice-Chancellor of the Manchester University, I think ?—Yes.

8856. You have been kind enough to express your willingness to give this Committee some evidence on the subject which they are now considering, and I dare say you are aware of the terms of reference ?—I have read the terms of reference.

8857. Perhaps the best plan would be to ask you to be kind enough to state, in your own words, what your views are on the subject of the reference ?—I might perhaps say first what we are actually doing in subjects bearing in any way on agriculture in the University of Manchester, and then perhaps come to the future possible developments.

8858. Yes.—With regard to what we are doing now, we have no general degree course in agriculture or definite instruction in it at all at present ; but I think, on the other hand, we are exceptionally strong in the subjects bearing directly or indirectly on agriculture. In chemistry, for example, which bears on it, we have a particularly strong department. There are two professors and eight or nine demonstrators, and we have very large chemical laboratories. We have a very strong department in zoology and in botany, and, in addition to that, in engineering and surveying, so far as these subjects come in, we have provision for instruction. Then we have also very complete laboratories for bacteriology and a professor of that subject. We differ in that respect from most of

the other university colleges and universities, in the fact that we have separate professorships of general pathology and of bacteriology, and we have special laboratories for each. We have a special diploma in the department of veterinary state medicine. We do not admit for that diploma any except those who have already got the veterinary qualification. After obtaining that qualification, the candidates take a special course of study for the diploma in veterinary state medicine. The investigations in the public health department under the professor of bacteriology deal with the diseases of animals, and matters which may directly or indirectly affect agriculture, as well as with the subject of public health and diseases affecting human beings. Then, with regard to botany and zoology, we have made recently a special development. This year we have appointed, for the first time, a lecturer in economic zoology and one in economic botany. Perhaps I may hand in the memoranda on their appointments. I will not trouble to read in detail the terms of the appointment. It shows, however, the lines of future development of the work which we might fairly undertake. In substance it amounts to this, that both in zoology and in botany, there is a threefold work to be undertaken by these lecturers in conjunction with the professors who are the heads of those two departments. The first is reporting, that is, dealing with subjects which may be sent by local authorities or private individuals. For example, animal pests, not necessarily confined to agriculture, but also affecting various mercantile products, as well, will be

Dr. A.
Hopkinson.
18 June, 1907

investigated. The water supply and the injurious creatures which may exist in reservoirs belonging to local authorities can be investigated. We can do the same with regard to botany. We should expect to send reports from time to time on specimens which may be sent to us, and, there again, that can be done both as regards agricultural and commercial undertakings. Then the second head of work which is assigned to these lecturers, under the direction of the professors, is definite original research for the purpose of advancing knowledge. Of course, these two branches no doubt overlap to some extent. One deals with the specific reporting for the local body or individual as to a particular product, and the other is with the general view of advancing science. Then instruction and courses of lectures are provided for students of economic zoology and botany. I might hand in the terms of appointment of those lecturers, perhaps. (*Handing in same.*) I may say at once these are quite new things.

8858b The financial question comes in here. With regard to economic botany, for instance, we have to assign a very small stipend indeed. We have had to appoint quite a young man, very competent and able so far as we can judge, but if we wish to keep a man of that sort for any length of time we must increase the stipend, but the resources of the University are insufficient for that and for the necessary equipment. We have also in Manchester a very large natural history museum, and the duty of the lecturers in conjunction with the professors of the two departments will be to see to the arrangement and proper labelling and the receipt of specimens, that will be useful in connection with economic botany or zoology.

8859. Does this museum belong to the University?—Yes. There is a special committee of management, on which there are representatives of the City Corporation as well as of the University. The museum is the property of the University, and the committee acts under the general control of the University Council. It is open to the public under the terms of the arrangements under which the museum is founded, and that museum is now very full and is capable of very considerable development. Especially is it important that we should have a new wing at the museum devoted to botany and also more laboratory accommodation, leaving the present accommodation mainly for zoology and geology. The museum is found very valuable in connection with school work, and that is, perhaps, rather outside the purview of this committee.

8860. No, I think not.—As regards school work, I think it is important to notice that the boys and girls from the schools round are more and more using the museum as a place to go to, under the direction of the teachers and the museum staff, to see specimens bearing on their work in school, whether primary or secondary.

8861. For both you say?—Yes, but mainly, I think, at present, secondary. The young people come to have their specimens marked and identified, and the teachers in the school find it a great advantage to have some place near hand where they can bring the scholars.

8862. Do you have any special collection in the museum of farm animals?—No, not at present. I do not think we have any such special distinct collection, but I hope that with these new developments and new lectures we may, at all events in botany, have an arrangement of specimens that would be very useful from an economic point of view. That is roughly the sort of thing we have at present.

8863a Have you anything to say as to whether your services are likely to be much required for making these reports?—It is very difficult to form an estimate at present. Of course it will depend on the repute of the men and how the thing is worked and how far it gets popularly known. But I may give one example of the kind of thing we do: there was the case of a reservoir which was found to be polluted. It was a case for zoological investigation, and the professor reported on it, and found means of putting an end to the pests infecting that reservoir.

8864. On what terms is that sort of work done? Is it paid for, or what do you do as to a fee being charged?—We have not, as a rule, charged a fee in botany and zoology yet, but we have a scale of fees in another department. We have a public health department, where we have laboratories to which the local authorities and hospitals and medical men send in specimens for bacteriological investigation. There we have a scale of payments. Three thousand or 4,000 reports are sent out every year from that department, and as to stipends of the special staff engaged, it is self-supporting.

8865. Can you say as to whether that department undertakes anything in the way of the bacteriological

examination of milk?—Yes, from time to time it does so. As to those investigations, that is just one case in which we find the University Department is far the most efficient. They are difficult investigations to deal with, and they occur at irregular intervals, and I do not think that any local authority can do them in the same full way that the University can. Instead of having to investigate for one local authority we may have 50 or 60 authorities sending in subjects for investigation, and there is a constant supply of work for the staff. I could furnish, if desired, a full report of the work of the Public Health Department, which in part, but in part only, bears on agriculture.

8866. Would that department deal with the question of tuberculosis in animals?—Yes, they have had some investigations on that subject. I may mention one investigation undertaken recently as to the effect of feeding of different kinds, and of certain medical preparations, on tuberculosis in swine.

8867. What is the nature of the jurisdiction or area in which the University operates? Does it cover the whole county of Lancashire?—There are, perhaps, two senses in which the question may be taken. There is first the area from which students come to the University in large numbers—we may say almost daily—by train, and what we call our sphere of influence. That takes in the district from the extreme north of Lancashire to the county of Stafford. I think one might take it from Lancaster and Blackburn to Leek and Stoke and Crewe. Then the University of Liverpool overlaps in such places as Warrington and Preston. It is difficult to say which they belong to. But we have had students coming from Halifax lately and the north-west of Derbyshire. That is about the district where one has to go and distribute prizes from time to time to schools which regularly send pupils to our University, and we may take it, the district includes east, north-east and north Lancashire, east Cheshire, north-west Derbyshire, and north Staffordshire. We appoint representatives of schools over that district. Then, in addition to that, we have students who come especially for the higher work, not only from all over the country, but all over the world—from Japan, Russia, Switzerland, for example.

8868. But leaving out Liverpool, about which we know nothing officially at the present moment, we might say that at any rate Manchester provides a centre where the highest scientific knowledge can either be obtained or sought for the whole of that district?—Yes. Of course Liverpool has grown very rapidly, and we may have on certain subjects to make an arrangement under which they will take a lead in some matters and we in others. Liverpool people will take up tropical medicine, and we may not have any call on any substantial scale to do that.

8869. But at any rate you do aim at providing the highest scientific knowledge that can be obtained at present by the district?—Yes, and also we may say that we have students and men coming to do research work from all over the world.

8870. And you are prepared to distribute such information as may be obtained for the benefit of society at large?—Yes, we wish not merely to be a teaching institution for the city, but we wish to take an active part in the assistance of education of all forms and over a wide area.

8871. Now perhaps you will be good enough to tell us what developments you have in your mind for the future?—The first thing we must recognise is that we must not take up developments which would interfere with or prejudice the agricultural education which is given under the County of Lancashire scheme at Hutton, near Preston, and under the Cheshire County Council at Holmes Chapel. Those are the two places for specific agricultural education which are nearest to us.

8872. Surely you would not interfere with them?—We might give mutual assistance if we worked on right lines and work in satisfactory relationship with them from the beginning. For example, I do not think we should ever go to the expense of providing farms. They have good farms at Holmes Chapel and Hutton, and by means of supplementing the education there given we might do very useful work. We cannot educate the ordinary farmer as a rule at the University. That could be done better and adequately both at Holmes Chapel and Hutton. I think we might provide in the University a department for original scientific researches and might work very efficiently in association with some of the local authorities in making experiments of a useful kind. We have recently acquired, quite near Manchester, a considerable property which would be useful for experiments carried on in

Dr. A.
Hopkinson.
18 June, 1907

zoology and botany. That property is less than two miles from the University. Then I think we might do a good deal by working in co-operation with Holmes Chapel, for example, in two ways. One is where there are really good students there who ought to go on to become either teachers or estate agents on a large scale, or who might go abroad. We might affiliate the work of that institution there to this extent, that a student might count the period of his study there as against one year of the three required for a degree in our University. We might take one of the three years required in that way, and then he would come to the University for two years' instruction in sciences bearing on agriculture. Then, what is still more hopeful, I think, is this: that we might have young men who have been at the ordinary secondary schools coming and matriculating and taking a course of study with us for the degree of Bachelor of Science, and who desire to take up agricultural work. In the case of such students we should recognise agricultural work done at such an institution as Holmes Chapel. We have plenty of analogous cases, for example, in the degree of Bachelor of Science, in which pharmacy may be taken up as a special subject. So we might have agriculture taken up as a special subject. We have a degree now in mining. There the men work during part of their course in the actual coal mines in the district, or, if it is metal mining, they go to the Isle of Man in vacation time. Some arrangement could be made with such an institution as Holmes Chapel or Hutton: students would go there for practical work, and we should have a complete course of study between what was provided outside and what is done at the University. That is a possible development. Then we could give our degree or certificate, as the case might be, giving University recognition to such work. These graduates might become teachers or take up agricultural work on a large scale, or they might become agricultural experts, or they might go abroad. Those are the lines of development.

8873. What are the courses of study? You have already mentioned the degree and certificate. The degree is a three years' course, I suppose?—Yes.

8874. What is the certificate course?—The certificate varies on different subjects. Take the mining certificate, which is a recent one, the mining certificate and degree are both recognised by the Home Office for mining certificates. The mining certificate involves a two years' course. Then again, in engineering, the certificate involves a three years' course, but the certificate can be taken without passing matriculation. Men in works may take up the course after they have dropped ordinary school subjects for many years. We give a certificate there, but those cases are becoming less numerous, as it becomes more and more the habit of schools now regularly to prepare for our matriculation.

8875. Have you any other short courses in mind?—Two years is the minimum for any certificate except those cases where, for those who have already graduated, we give a special diploma. The Public Health Diploma may be taken in one year. The Teacher's Diploma can in one year after graduation. But I think we have no certificate which is not post graduate which does not involve two years at least.

8876. Then you suggest that you could provide facilities for instruction, say for teachers in the higher agricultural branches, and such as I know from my personal experience they largely go to Scotland for. You hope to be able to supply that at Manchester?—Quite so.

8877. Also in other allied scientific pursuits, such as those of analysts and chemists and those special businesses?—Yes.

8878. I do not know myself, personally, what the qualifications of an analyst are. I do not know whether you know what is special?—I am not sure whether local authorities have special rules, but, as regards ordinary chemical analysis, one who has been through the honours course in chemistry is admirably prepared to take it up, with a little experience. But as to bacteriological work, those who are to act for local authorities would require special training in public health laboratories. We can do that very well. We should want to superimpose on the scientific work we now do some definite agricultural work, which we at present do not provide. I think we should want more resources to do what I have indicated.

8879. Is the University supported by public or private money, or both?—It was started with private endowment entirely and, for many years, worked entirely

with that. Now we have from the Treasury a very substantial Government Grant, which was increased two years ago, and subsequently was increased under an arrangement then made. Then we have support from various local authorities, from Manchester and the County of Lancaster and of Cheshire and the boroughs of Bury, Oldham, Stockport, and one or two other boroughs. The latter contributions are small in amount, but still we value the association very much indeed, because it shows there is an interest taken in the University by all the authorities. They are also represented on the governing body.

8880. I am not familiar with Lancashire, but am I right in saying that many of those towns which you have just mentioned have higher schools and places which are collegiate centres where chemistry and other scientific subjects are taught?—They all have their technical schools, but they have a different scope from the University work.

8881. Do their students go on from those technical schools to complete their education with you?—In some cases, yes, but, of course, a great deal of their work, the most part of it, in fact, is evening work. What we naturally draw more from is the grammar schools, including the municipal schools which are developing all over the county and especially in the great towns of the county.

8882. (By Dr. Somerville.) You only allow specialisation in the third year, I understand. Does that apply, for example, to a man studying engineering?—No. I must have mis-expressed myself if I put it in that way. I only meant with regard to those coming and taking up agriculture as a special subject; such students might take up the special subject in the second or third year. In our honours school they specialise from the very first, and become more specialised as they go on. In chemistry, if a man takes up honours, he works at chemistry as his special subject from the beginning, though in the first year he would take physics or other science.

8883. He will take physics and mathematics possibly, and would he be allowed in his second year to confine himself entirely to chemistry?—I think not, entirely.

8884. But in his third year would he?—In the third entirely, and in the second year probably physics. It is, roughly speaking, becoming more specialised as the course advances. But no man would take his degree entirely in a simple subject. Although taking engineering honours he attends mathematics throughout his course. If he takes up physics he would also take mathematics, and might take electro-technics.

8885. Perhaps I did not express myself quite well, but, I think, I am probably correct in thinking that, for example, if a man is going to take his degree in the honours school of botany, it would be only during his third year that he would be allowed to confine himself to that?—He would take zoology at some period too.

8886. But during his third year?—In his third year he might confine himself to Botany. I could give the exact details of the course, but, roughly speaking, that is what it amounts to.

8887. Then I gather rather that your so-called diploma is a superior certificate?—They are different in kind. The certificate is, as it were, alternative to the degree. The diploma is something taken in some special line after a degree.

8888. And is only given to graduates?—I think in all cases it is given to graduates only, but I will not say absolutely so. Take the diploma in Public Health, a man might take that if he had his qualifications from the Conjoint Medical Board instead of the University, but he would have to become a qualified practitioner, and so with Veterinary State Medicine—he has to become a veterinary surgeon.

8889. So that the course for the diploma is a four years, course, really?—Yes.

8890. Do a considerable number stay on so long?—Yes. The Veterinary State Medicine is a new thing, but there are some students in it each year. In the Teachers' diploma, we have a considerable number.

8891. These two diplomas, the Public Health and the Teachers', have got a definite commercial value which is easily appreciated?—Yes.

8892. But do you give one in engineering?—No, not a post graduate diploma, but a certificate such as I have described.

8893. For geology?—No.

8894. Or economics?—No.

*Dr. A.
Hopkinson.*

18 June, 1907

8895. Only in Public Health and Veterinary State Medicine and in Teaching?—I think those are the only diplomas at present of that kind. Of course, we have a great deal of post graduate work in other lines, but not for a specific diploma.

8896. Have you formed an opinion as to the public assistance in the direction of a grant to the University which would be necessary to satisfactorily equip the University to give instruction of the kind requisite for a degree in agriculture?—Even working with Holmes Chapel, we should want a very substantial amount. Take the case of the two departments you named before. A young man is appointed lecturer in botany at £125 a year. It is absolutely impossible to keep a man for any length of time at that, and we should want a substantial addition to the funds for the purpose. Then our museum is overcrowded already, and if there are any developments in the economic line, we should want a new building, and that means more rates and lighting and heating, as well as capital outlay. Every development of the buildings means a very substantial increase in upkeep.

8897. The work of a lecturer in zoology would also involve a course in agriculture?—Yes. We have a larger stipend there, but in both cases the stipends are inadequate.

8898. The aggregation of these two stipends is only £325 a year?—Yes. We get clever young men who will work up in it and they ought to have very much more in a very short time, as soon as they have proved their metal.

8899. In your department of surveying, you supply all the instruction required, I suppose?—Yes, but even there, if we get a substantial addition to the number of students, it means an additional demonstrator. At present our engineering accommodation is quite deficient, and we are bound to build another building. The drawing room will not accommodate the students who want to be actually at work there. So that we are constantly hampered there. We have got a room which is quite inadequate for the students, and the same in regard to the chemical laboratory, so that we cannot afford the requisite development.

8900. So far as the personnel is concerned, with an assured grant of something like £1,000 or £1,200 a year, you would probably see your way to proceed?—Yes. There are certain lines of action which the public demand would support, and we could help the development with the resources of the University.

8901. (*By Mr. Medd.*) Have you conferred at all with the Liverpool University on the subject yet?—No, not on this subject.

8902. Because, of course, Liverpool would cover very much the same ground that you would cover unless you came to some local arrangement?—Partially so. There are portions in which we overlap.

8903. As to agricultural education, Liverpool is excluded from Flint by Bangor, so that you and Liverpool would, at first sight, have to share Lancashire and Cheshire?—And North Staffordshire, and, I should think, one might go as far as Shrewsbury on the other side and the middle of Derbyshire on the other.

8904. How would you divide your areas between yourself and Liverpool?—The same question arises on other subjects at present. At present students come to which they like.

8905. But they come for miscellaneous subjects. Here in agricultural education the amount of money available is very small, and it is very desirable to concentrate the various areas and to affiliate them to particular centres in approaching the Board of Agriculture?—Yes.

8906. Now I understood you to say to Lord Barnard that, of course, the School of Tropical Medicine is centred at Liverpool?—Yes.

8907. Would it not be possible for you to agree, before taking any further steps, with Liverpool, that the scope of agricultural research or education should be centred at Manchester?—I do not know what the Liverpool people would say to that. Of course, our departments are the older ones, but one recognises the fact that in several respects Liverpool is extremely good and has done good work.

8908. But in the future I can see very serious difficulties in having to provide out of public funds for two universities so close together as Manchester and Liverpool. For instance, we might say that Holmes Chapel would fall more obviously within the sphere of Liverpool than within the sphere of Manchester?—I think Holmes Chapel is rather nearer to Manchester by train than it is to Liverpool.

8909. Then you would cut Liverpool off with very little,

would you not?—Yes, I think it would be smaller, but, certainly, Holmes Chapel is nearer Manchester. It is on the main line.

8910. It is a few miles nearer, but take Warrington. That goes to Liverpool, obviously?—It is a little nearer Manchester. It is a question of Bradshaw's Time Table, but I think it is a shade nearer to Manchester. However, we have the same question as to teachers there. Warrington is, we may say, neutral ground.

8911. But in each of those departments there is a very much larger number of students to cater for. You would have very many more students to train as teachers than you would in agriculture?—Yes, I think so.

8912. If you are to establish in the future agricultural centres at both Liverpool and Manchester, the number of students at the two would be comparatively very small?—I think one must look at it partly from this point of view, that I do not think either university ought to go to the expense of establishing a farm. I do not think that would be legitimate in either case. They both have large botanical departments already.

8913. What I am anxious about is to obtain an opinion from you favourable to the idea of conferring with Liverpool and utilising your university in preference to theirs as a centre?—I cannot say what Liverpool would say to that. Two large towns like Liverpool and Manchester often feel that they do not like to co-operate.

8914. I feel on the whole that your scheme is extremely likely to fall to the ground if you attempt to establish it without Liverpool?—Liverpool has one branch, that is Tropical Medicine, and we should not think of interfering with Tropical Medicine. We should not think of interfering with the Tropical Medicine or the fishery branch.

8915. It is quite natural that Liverpool might hand over its training in agriculture to you at Manchester?—I feel a little difficulty about speaking for Liverpool, but we have not the slightest intention of putting up a school of tropical medicine on a large scale at Manchester. There are certain things in which we have a kind of competition. I do not say there need be in agriculture at all. But there is the Public Health Department; both universities undertake this work; ours is the older, and we report for a large number of authorities all over the North of England, but Liverpool also has a department of the kind, and I do not think that there has been any harm done by both working on those lines.

8916. My questions were merely as to the desirability of forestalling any opposition on the part of Liverpool, or overcoming it, so that the possible danger which would arise from having two universities in competition might be avoided on this point. That is all.—If Liverpool liked it, it would do, of course, but, on the other hand, we could not shut our eyes to the fact that Liverpool has done a good deal bearing on agriculture. I do not think it would be in any degree fatal to the scheme, if both had agricultural departments, but I think it would be better to have an arrangement under which Manchester should do so.

8917. There might be a joint scheme, but by working in conflict you would find it extremely difficult to get adequate Government aid and also to get an adequate number of students for research purposes. It would be said that they are so close together that one can cater for the district, and we cannot support two?—I fancy the population is so large that there would be scope, provided you did not attempt to get a complete agricultural department under the University only. The Yorkshire College has that, but it would seem impossible for two universities so near as Manchester and Liverpool to expect public support on that basis. But I do not think it would be fatal to have such a thing as a course at Holmes Chapel before coming to a scientific department in Manchester or Liverpool, which ever happened to have more distinguished men in the various departments and to be preferred by the student.

8918. I was hoping your intention was to establish a definite agricultural department—with or without a farm is another matter—but to have a centre for the highest agricultural research to which the selected pupils from Harris' Institute and Holmes Chapel might come, and that I take it is your idea?—That is the best arrangement.

8919. Then I want to see how it would work if you became in that way what I may term the collegiate or university centre for a group of counties, the counties being Lancashire, Cheshire, Shropshire and Derbyshire. As to Birmingham, it is a question of railway approach

Dr. A.
Hopkinson.
18 June, 1907

to some extent, but in that way you could undertake the supervision of the agricultural education of the whole of that area?—Yes.

8920. Leaving of course the management of each separate institution as it exists at present?—Yes.

8921. Then you would not object, I suppose, to a Joint Committee with representatives from those institutions and from the respective local bodies?—Speaking off hand, that seems to be the best in outline. I should prefer that, if it could be worked.

8922. To obtain your opinion on that point was the only reason for my asking you in regard to the possibility of action on the part of Liverpool, which would necessarily render it more difficult?—Yes, it would render it more difficult. The scheme suggested is, in my opinion, speaking off hand, the best one. But of course the Liverpool people work on the most friendly terms with us, although we are working in a sense in competition.

8923. I dare say in many matters of this kind there is a principle of give and take, and in this matter of Tropical Medicine you do not undertake it at all at Manchester, do you?—No. We offer a short course that medical men can go to, but it is on quite a different scale.

8924. You have left Tropical Medicine as well as the fishery branch entirely to Liverpool?—Yes, substantially.

8925. Do you now insist on residence for all students?—Yes, for all degree students: that is, residence in this sense, that they must attend a regular course of study. We do not act merely as an examining body or grant degrees without insisting on regular study in the University.

8926. What is the minimum period?—The normal period is three years and the only exceptions are in favour of those who have been through an adequate course of study at some other recognised institution. Supposing a man came with a degree from a colonial university, we should let him enter and recognise his course of study there as covering part of the three years.

8927. But coming from such an institution as Harper-Adams or Holmes Chapel or Harris Institute, what do you say?—We should require probably two years. Harris Institute we have already an affiliation scheme with, and under that their students would take one year less—they would take two years, that is. We are now considering whether that is to be continued or not. Harris Institute has altered its character a good deal and we are having an enquiry now to know whether that affiliation scheme should be continued.

8928. There is no likelihood of reducing the period of residence below two years, is there?—I do not know. That is a matter our Faculties would have to consider carefully. It might depend on the institution, but I think probably not. In medicine, we are not allowed by our charter to give the degree under two years, though we should take three years at Cambridge or at London University as part of the

five years required for qualification. Yet two years in the University is the minimum in medicine.

8929. Then what are you doing now in the training of elementary school teachers. I do not mean at the ordinary school, but in rural subjects?—I think we cannot say that we are actually training specially in rural subjects. Our position with regard to the elementary schools is that we have 100 men and 100 women training in our Department as elementary teachers. We do not admit any that have not passed the University Matriculation first, and then they take a three years' course and a degree as well as practical teaching in schools. Then they get their teaching certificate, and they also have the degree.

8930. But you have paid, I think, special attention to nature study?—Yes, we have special classes of study both in zoology and in botany for these teachers, and I have here a prospectus which shows the course of study.

8931. They are very popular and very useful, are they not?—Yes, they are very useful and very much liked. Then we have had a course by one of our staff taking students up the Lake district for field work.

8932. Do you find the nature study subjects are equally beneficial to the urban as well as the rural teacher?—I should think that the majority of our students are urban teachers, and I feel sure the courses are advantageous to them.

8933. The great attention that you pay to these particular subjects has been rewarded by turning out a more intelligent or more observant type of teacher?—I think so—I hope so—and as time goes on I hope we shall find it much more so.

8934. (*By Lord Barnard.*) I do not think I asked you what the administration of the University consists in. Is it a Council?—The Executive body is a Committee of the Court, which is called the Council, constituted under our charter. That is a body of about 22, of whom the Chancellor and Vice-Chancellor are *ex-officio* members. There are four professors elected by the Senate, and then the others are for the most part men of business or professional men in the town. The Senate of Professors deals with the general academic work.

8935. How are the members of the Council appointed?—They are elected by the Court. The Council is a small body and the Court is a large one. The Court appoints the members of the Council.

8936. The Corporation of the City of Manchester and these other boroughs in the County have no official post in the management of the University, have they?—Yes, they are all represented on the Court, which is a body of about 70 members. That body is constituted partly of Nominees of the Crown, or the Lord President, partly of the Nominees of the Chancellor, partly co-opted members, five from the City of Manchester, three from the County, one each from such towns as Bolton, Bury, Salford, Oldham and Stockport, and from other public bodies such as the Chamber of Commerce and the Royal Infirmary.

Professor F. E. WEISS, D.Sc., called and examined.

Professor
Weiss.

8937. (*By Lord Barnard.*) You are Professor of Botany in the Manchester University?—Yes.

8938. How long have you been that?—Since 1892.

8939. You have heard the evidence given by the Vice-Chancellor?—Yes.

8940. Would you like to give any information to the Committee which he has not already given, or express an opinion on anything connected with our enquiry?—I should like to supplement one or two things that the Vice-Chancellor has been laying before you. You asked him with regard to the possible scope of enquiries from local authorities on agricultural subjects. Up to now we have had a considerable number from different localities and private individuals. That is one of the reasons for appointing the economic botanist to take up these more in detail and to devote more attention than is at present given to them. Up to now they have fallen to myself and the assistant in the museum, and last year we answered something like 100 enquiries, which were sometimes very trivial, merely the identification of plants which travellers had brought, or sometimes were of economic nature, it might be the determination of timbers or certain tropical fruits, or sometimes of an agricultural nature,

such as the determination of plant diseases or the determination of various weeds which had been sent for identification. That was about the high tide of our enquiries in the year, but, so far, since the beginning of this year we have had quite a number of them. I think it is becoming recognised that we can do this kind of work, and we get more than was formerly the case.

8941. Is this work peculiar to your University?—In Liverpool they have established an Institute of Tropical Research which deals with timbers and products that come there into the docks very largely, and economic products, and so far it is overlapping with our work, but we have now rather a larger number of ships coming in to Manchester and bringing timber which has to be dealt with on the spot more or less. We are prepared in the museum now to deal with them. We have good collections both of microscopic specimens and of large sections of timber and the necessary books for the determination of these products. I think that even if Liverpool does it we shall have to provide the information for our Manchester importers. Then another point was one that Mr. Medd raised with regard to the classes of teachers who have taken up nature study at the University. I have conducted such classes on Saturday

Professor
Weiss.

18 June, 1907

mornings for their convenience. These are acting teachers, not teachers in training at the University. We have large classes. I remember the first class was about forty, then it went up to 70, and then up to 130 on the Saturday mornings, and some of these teachers have been for two, three, or even four years in succession, because in each year I give a new course dealing with other aspects of the subject. As regards the composition of such classes, they are obviously mostly town teachers sent by the Cheshire County Council. The Cheshire County Council has been doing work on a somewhat extensive scale for nature study amongst its teachers. We were recognised as one of the centres for such work. The results are very satisfactory from our point of view. We find the teachers in constant touch with us, often seeking information on those subjects and doing good work in their school. Those that I have seen in and near Manchester are certainly doing very good work in spreading the knowledge that they have gained. Then one other subject was in regard to arrangements in the museum. You were asking whether we had a special grouping of animals or plants of an agricultural nature. We have that as far as plants are concerned. We have in that way special cases dealing with the diseases of plants produced by animals and parasites and malformations.

8941b

8942. Is that the ordinary farm plants of this country?—Yes. Some are from outside of Britain, and what we want to do now that we have a man who is specially devoted to economic botany is to increase the display of such objects. The teachers make great use of our museum as well as the pupils, and on Saturday afternoons we have regularly either a lecture or some demonstration in the museum to the general public, which includes very large numbers of teachers. But we require more room. I have two rooms at my disposal for botany, but they are inadequate to extend now into the domain of agriculture or economic botany.

8943. Do you send out publications which would be useful to agricultural students?—We have not done so far. In the past we have issued special pamphlets on subjects connected with the work, but not on agriculture. But now the general plan is to publish whatever research is being done in some scientific journal and to circulate it amongst the subscribers of the museum, the correspondents, as I will call them, who supply us with material and send us information. We circulate the reprints from the scientific periodicals on our own account.

8944. I want to ascertain how the results of your work are circulated amongst those who are practically interested in it. Does that information reach the hands, say, of teachers in places like Holmes Chapel, do you think?—I have sent them any publications which I thought at all interesting to them.

8945. So that they in turn can hand them on to other students?—Yes.

8946. The object I had in asking the question was to find out whether this information really reached the general public?—I represent the University on the Cheshire Education Committee, and have been put on the Holmes Chapel Agricultural Sub-committee, so that I am in close touch with their work.

8947. Of course a provincial university is merely a local institution, but the fact of its having public Government

money makes it a national institution, and would that information go to other places outside the district?—I do not think we have circulated reports except to people who have applied for information. But our researches have not been largely on economic lines. In both zoology and botany reprints of our researches are circulated all over the world. We get exchanges from every part of the world really. I send them abroad to Canada and towns in South Africa, so that we are in touch with the work being done.

8948. I think I am right in saying that in Canada and the Cape and Natal, and also in the United States and other countries, the departments charged with the control of this kind of work take every step to publish the information obtained by scientific men amongst those who require it?—I believe that is so.

8949. Do you think that such a scheme would be possible in England with the Board of Agriculture—say all your publications being sent to the Board of Agriculture and that they should circulate them amongst those colleges and institutions?—Do you mean the result of the scientific investigations?

8950. Yes, and reports and so on?—I do not think there would be any objection to that so far as I can see.

8951. So that the public money should be made use of by the public all over the country?—That would be a very good plan, I think.

8952. Do you give lectures outside occasionally?—We have the university extension courses. I am to give a course at Warrington on plant life, and I have given two other courses in the neighbourhood of Manchester, and one at Wimslow, in Cheshire. There are occasional lectures which we give. I gave one at Holmes Chapel to the students there on agriculture in the Transvaal. I had an opportunity of seeing something of South African agriculture when out with the British Association.

8953. (By Lord Moreton.) You have botanical enquiries, I understand?—Yes.

8954. Could you tell us roughly at all how many of those would apply to British agriculture?—Not more than a dozen, I should say.

8955. (By Mr. Medd.) I should be glad if you could tell me the cost to the acting teachers who come. Do you know how the fares are paid?—By the Cheshire County Council in the case of their teachers, and the same with the fees of their students.

8956. It costs the teacher nothing?—Nothing.

8957. Then how were they paid elsewhere? Did they pay themselves?—The great majority paid themselves. There is an arrangement by which the Board of Education pays the fees of the recognised science teachers. I do not think it would affect really more than perhaps eight or ten.

8958. Do you ever visit the schools at which these teachers are engaged?—I have visited those in the neighbourhood of Manchester, but not the County schools.

8959. And you find them a better type of teacher?—Yes. I think the teachers of these schools are doing really very good work. I have seen them both at Stockport and at Manchester.

Mr. H. HAMEL SMITH, called and examined.

8960. (By Lord Barnard.) You are aware of the terms of reference to this Committee?—Yes, I think I am.

8961. The object of the Committee is: "To inquire as to the provision which has now been made for affording scientific and technical instruction in agriculture in England and Wales and to report whether in view of the practical results which have already been obtained, the existing facilities for the purpose are satisfactory and sufficient and if not in what manner they may with advantage be modified or extended." You state that you wish to give us your views on the subject?—You mean in the United Kingdom when you speak of this country, do you?

8962. The reference applies to scientific and technical instruction in England and Wales, but the persons who

receive that instruction may go elsewhere afterwards?—Yes.

8963. Therefore I do not want you to be limited to this country in your evidence. It is the instruction given in this country.—Yes.

8964. Will you state to the Committee what your views are on the subject?—As far as this country is concerned, I would go mostly to London where my experience has been. I would say, compared with Liverpool, the Londoner does not appreciate the value of research work. I find he is rather of a selfish disposition, and as long as trade comes his way, he takes it for granted that it is due to him as being located in the biggest city in the world. But the tendency has been for products to leave London and go elsewhere, and I think it is due a good deal to the

Mr. H.
Hamel Smith.

Mr. H.
Hamel Smith.
18 June. 1907

lack of research work in London as compared with Liverpool. I have noticed of late that the Liverpool people are teaching their residents in many ways to study economic products thoroughly both from a productive and manufacturing point of view. I have been now in London in commercial life nearly twenty-five years, and abroad I have had to do with estates. When I came back to London in 1898 and began to want to settle down and learn as much as I could, I found great difficulty in London in obtaining information as regards the agricultural products with which I am connected in business, and ever since then my attention has been drawn to the lack of means for obtaining such knowledge unless you had a scientific education, which I have not had. I went to the South Kensington Museum and they kindly allowed me to use the library, and so since 1898 I have read up agricultural books and obtained some sort of knowledge, and I am now running a paper with Messrs. Bale, Ltd., who publish *The Journal of Tropical Medicine*, to try and make up for this defect as much as we can as far as London is concerned. I think that in training people for agriculture the tendency is that they do not pay enough attention to the selling of the produce when it is obtained, because sometimes an article is grown in too great a quantity and the market gets flooded, or tastes vary and that particular article is not wanted in a certain locality, whereas if they increased the quantity of another article that could be equally well grown on the same spot the man would not suffer as much loss or he would make a greater profit in the products that he is turning out.

8965. I am afraid that the information which you wish to give is a little outside the scope of our Inquiry, as you will see by looking at the terms of reference of the Committee. You must remember, please, that this Committee is not a Royal Commission appointed to enquire into a very large subject, but is a Departmental Committee appointed by the President of the Board of Agriculture to report to him, and I imagine that it is no good reporting to him on any subject outside his jurisdiction. If you can give us any information as to what is done in the Colonies and which bears on our Inquiry which we can tell the President of the Board of Agriculture, well and good?—Then I am to understand that I am not to go outside the United Kingdom?

8966. Referring to your letter, you are associated, I understand, with the West Indian trade?—Yes.

8967. Which is principally concerned with agricultural products?—Yes.

8968. Do the Governments of those Colonies provide any scientific instruction for the benefit of the planters, do you know?—I see in the last Trinidad Blue Book that they have an item of £11,800 put down for botanical agriculture, £3,400 for personal emoluments, and £8,300 for other charges, but I do not know whether that comes under scientific agriculture.

8969. That is done by what Colony?—Trinidad, one of the West Indian Islands.

8970. The Government, then, does a good deal for them?—Yes, I think the Government would like to do a great deal.

8971. Now you have some criticisms to make on the training of instructors. Do you have instructors?—Yes, we have, but I do not consider in that particular island that the men are scientific enough. I would except the President of the Government laboratory, but he is not an agricultural instructor.

8972. Are most of those scientific men trained in the Colony?—Yes. Mr. Hart is the curator of the Botanical Gardens. He has just resigned. I did hear that they were going to appoint a cocoa expert. That was mentioned by Mr. Norman Lamont, but I have not heard anything

else from any other source. I should like to see such a man appointed. He is badly wanted.

8973. How do you think these experts should be trained?—Having had a scientific education in England they should most certainly be sent round, as Dr. Preuss was by Germany, to all the cocoa producing centres to see what is doing there and compare their way of working with the way of working in the particular centre they are going to be located in. That is the only way in my opinion in which you could train them.

8974. The scientific part of their training should be first acquired in this country, do you say?—Yes. From all I have heard of Ceylon, you could get very good training here. Mr. Herbert Wright and others have come from this side.

8975. I see from the note you sent our Secretary, that one idea you have is that they are insufficiently paid as instructors to enable them to keep in the service of their Government when they are becoming most useful?—Yes, the output of cocoa at the Gold Coast was eighty pounds in 1891 and twenty million pounds in 1906, due, I understand, a great deal to Mr. Johnston. Having brought about that most satisfactory state of affairs, down comes some private company who takes away Mr. Johnston from us just when we most want him. The Liverpool people have secured Mr. Herbert Wright from Ceylon in exactly the same way. It is a difficult matter to arrange the pay, but, still, I do think it is worth noting that you lose these men just when they have obtained valuable information and been well trained in their department and when they are perhaps most wanted.

8976. But still it is an encouragement to train for such work in England because they may be assured there will be an opening for them in the Colonies?—That is so, but we want such men for the good of the country. We do not want to train such men for other people to take advantage of them.

8977. You think instructors should also be given opportunities of travelling?—Yes, because often it seems to me the student has travelled about more than the instructor. I got that information from Dr. Olsson-Seffer, who is now in Mexico, but is a naturalised Englishman. He told me he would not entertain the offer of most of our posts because of the pay, and also because of the way he is shut down on the spot and not allowed to go about as the American Government sends them about. He has just been round the world to study rubber, which is his speciality.

8978. Do you know at all from your knowledge of the West Indies whether any of the other European countries which have posts in the West Indies do more for their Colonial subjects than we do?—No, because the West Indies are a very small place. I consider that the Government in the West Indies does a good deal or shows its willingness to do it.

8979. I am talking of the Home Government?—Yes, and I too. They seem to me to be willing to do a great deal. I could not suggest a remedy, but I maintain that the planters do not show the results that they could if they followed the advice given by the Government. I find they are rather obstinate or they imagine that their own ways are the best. With the agricultural training, they seem to me, from all accounts, to get hold of the peasant and to escape the master, and so long as the output of the produce—as the cocoa output in Trinidad—does not increase satisfactorily in relation to other countries I think it is a thing to take note of, because, of course, the exports of sugar have gone down very much. But I still feel that if peasants produced cane, and they had a central factory on a co-operative basis, the West Indies would still turn out sugar to pay.

NINETEENTH DAY.

Wednesday, 19th June, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

Lord MORETON,
Mr. F. D. ACLAND, M.P.
Mr. NORMAN LAMONT, M.P.
Mr. THOMAS LATHAM.

Mr. J. C. MEDD.
Professor WILLIAM SOMERVILLE, D.Sc.
Mr. A. E. BROOKE-HUNT (*Secretary*).
Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. CHARLES N. P. PHIPPS, called and examined.

8980. (*By Lord Barnard.*) You are Chairman of the Wiltshire Agricultural Education Committee?—I am.

8981. You have kindly consented to come here to tell us something of the work which that Committee is doing in the county?—Yes.

8982. Would you very briefly indicate to the Committee what line the work takes at present in your county—what the nature of the work is that you are carrying on?—Education in agricultural subjects, both practical and by lectures.

8983. Are the lectures held at one centre, or at various places?—At various places.

8984. You have been good enough to give us a list here of the subjects you deal with: "Bee-keeping, dairying, farriery, fruit tree pruning and grafting, horticulture and gardening, poultry keeping and veterinary instruction."—Yes.

8985. How many teachers have you?—We have sundry teachers for the bee-keeping, we have an instructress for the butter school, and we have an instructor for the cheese school. In the cheese school the instructor is Mr. Rogers, from Erlestoke Farm: he takes pupils at his farm, and he also travels about the county when asked to do so for the purpose of giving advice and instruction at various farms while cheese-making is going on.

8986. He is an actual practising farmer?—He is.

8987. What are his qualifications as a teacher? Has he ever been trained specially?—No.

8988. He is merely a practical man?—He is a practical man, and he is a considerable prize taker—in all probability he is well known to the gentleman on my left, Mr. Latham.

8989. Are your Committee satisfied with that system?—This is the first year we have tried it; we have had difficulties before because the applications were not sufficiently numerous. We had a cheese school some years ago, before I was chairman, when the late Lord Winford was chairman, and the thing rather fell through. But this year we are making another trial, and so far as one can judge I think it is going to be successful; we have had a good many applications. When I left Wiltshire about three weeks ago there were more than one could comfortably arrange for.

8990. Are the pupils men only, or men and women?—Both.

8991. How many can he take in at his farm?—I should think he could take in four or five.

8992. How long do they stay there? What is the length of the course—do you know?—I am afraid I cannot tell you at this moment.

8993. Do these pupils pay a fee?—They do.

8994. Does the county provide that fee?—No, they pay it themselves.

8995. Yet you find they are anxious to go?—Yes. It is not a large fee, it is rather charged on the principle of the people appreciating what they pay for.

8996. Do you happen to know what the fees are?—Half a crown for each course of instruction. All fees are

payable on joining the school, and visitors are admitted to watch the demonstrations on payment of 3d. That is the butter school, but it is the same, 2s. 6d., and if desired board and lodging will be provided at a reasonable cost, for the cheese school.

8997. The cheese school is more or less an informal school?—How do you mean informal?

8998. It is not very elaborately organised. You take a farmer who is a good cheese-maker, and ask him to give lectures more in the course of his business?—No; we pay him a fee. He gets about £60 for about six months' employment, and when he is moving about of course he gets his expenses paid.

8999. That experiment, I should think, would be very interesting, but you have hardly sufficient experience yet to say anything about it?—No; this is the first year.

9000. Then you have a migratory dairy school?—Yes.

9001. Has that been going for some years?—Yes, that has been going for a long time.

9002. Is that appreciated?—Very much. It has been going for some 15 years, and we have passed through pretty nearly 2,000 pupils. We have got a most excellent instructress, a certain Miss Kirke—a great deal depends upon the instructress.

9003. (*By Mr. Latham.*) You have always had a good instructress?—Yes; but we have a specially good one now. You know her well at the Bath and West.

9004. (*By Lord Barnard.*) Do you give the girls who pass through the training a certificate?—Yes, we give a card. We only give that card if they have obtained a certain number of marks.

9005. Do you hold an examination?—Yes, we have an examination. We make a difference between practice and theory. There is an oral examination and a paper examination. The papers go up to Professor Lloyd who examines them and makes a report and allots the marks.

9006. Do you think the quality of the butter is improved in consequence of this school?—I certainly think it has in some places, but there are still a number of people who make shocking bad butter.

9007. Do you know whether they get better prices?—No, I do not think they do. That is one of the difficulties. The price of butter is the same whether it is good, bad or indifferent.

9008. Is there any butter trade in the county? Does it go to London or the other large centres?—No. I think it is generally consumed in the county.

9009. Would it be possible to make butter for export?—Yes; I think it would be possible if the people would make it, but there is rather a disinclination amongst the rising and the risen generations to the work of the dairy.

9010. Are the pupils mostly farmers' daughters?—Yes. I can give you some rather interesting figures. The social position of the pupils for the last year was as follows: 107 farmers' wives, sons and daughters; 18 tradesmen, and three labourers. I do not know whether it is worth while my saying anything about the school.

Mr. C. N. P.
Phipps.

19 June, 1907

Mr. C. N. P.
Phipps.
19 June, 1907

9011. Yes.—We visited last year 8 centres, 14 courses were held and 128 pupils attended, compared with 10, 12, and 119 the previous year. Then as regards the examinations: the practice of course was better than the theory. 114 pupils were examined in the practical work and all passed. Of the 104 examined in theory 35 obtained at least 50 per cent. of the marks, five being placed in the first and 30 in the second class.

9012. Do you attribute the large proportion of failures in the theory partly to the want of education?—Professor Lloyd does. This is what Professor Lloyd says in his report. He has said so before, on one or two occasions. He again refers to the general education on the part of some of the pupils, and states that “the practical knowledge of the pupils seems to begin merely with the actual treatment of the cream given them to churn. How to obtain that cream, how to ensure it not losing any fat in the separated milk, how to treat the cream so as to prepare it and render it fit for churning does not appear to me to be understood practically. And yet in practical butter making everything depends upon this.” He goes on to say: “It is doubtful whether butter making will ever pay in England unless the best quality is made and all the bye products put to the most profitable use. These points should, I think, be kept constantly in view both by the teacher and the pupils, and all the instruction be so planned as to show how these ends may be obtained, and how from want of knowledge or skill they are frequently lost.”

9013. Lord Moreton would like to know whether you are referring to male pupils, or female pupils, or both?—Both.

9014. (*By Lord Moreton.*) I just wished to know whether it was in any sense ear-marking one sex?—No; I have had conversations with him on more than one occasion, and I have no reason to suppose that he was.

9015. (*By Lord Barnard.*) The butter instructress is one of your permanent officials in the county?—Miss Kirke, yes. When I say permanent, of course I mean from year to year.

9016. I mean, she is employed all the year round, and does nothing else probably?—All the year round—nine months. There is nothing for her to do, of course, in the winter.

9017. Have you anything more to say with regard to the butter school?—No, I do not think so.

9018. I see from the official Report here that you have a travelling farriery van?—Yes.

9019. How long has that been going?—For some years. It was first started by the late Lord Winford, better known as Colonel George Best, who was an expert in farriery. It has been going for a great number of years and I see no signs at all of any loss of interest being taken in it. When the school first began we had great difficulty in getting the smiths to come in; they were all under the impression that they knew everything about it and that there was nothing to learn. Farriery and shoeing generally was at a very low ebb in the county, but I think it has improved very much. To show the value of the school, we went last year to Marlborough, which I think your lordship will know is the centre of a good many training stables, and every smith in the district joined the course, and at the end we were obliged to have two if not three classes there. They sent me a “round-robin” expressing their satisfaction with the school, what pleasure they had felt in attending, and the great value they had received from it, and calling upon the other smiths to attend the school whenever they had the opportunity.

9020. Is your instructor in farriery, as your cheese instructor, more of a practical man than of a scientific man?—That is Mr. Hayden—he is a practical man, and a very good man. He can give a great deal more instruction than is absolutely necessary with regard to diseases of the foot and so on. What I have had to do has been rather to curb his desire to impart knowledge as to treatment. We should be in trouble with the veterinary surgeons at once if I had not, and what we want to do is to keep in with them. We have kept in with them and they are very well disposed towards us. Of course, we have a veterinary surgeon over him, a certain Mr. Bazley, who gives the lectures and examines.

9021. I was going to ask you how the result of the farriery work was tested?—By examinations at the end of the course, they are classed upon the result, and anybody that is good enough we recommend to the Farriers' Company for registration. To show, I think, that the work is well and carefully done, the Company wrote down to

us some few months ago to ask why we did not send up more men for registration. They wanted to know how the thing was done. I explained our system and said we endeavoured to be very very particular only to recommend men that there was absolutely no doubt about, and I thought it was rather in our favour that we were sending up so very few.

9022. Are fees paid for the farriery instruction?—There are fees. Apprentices pay a shilling a course and masters, journeymen and others pay two shillings. We have passed 900 pupils through the school.

9023. How long is the course?—I am afraid I cannot tell you, for I should like to be exact.

9024. Have you anything more to say as to the farriery side?—No; I do not know that I have. I may say we work in connection with the Wiltshire Agricultural Association so far as dairying and farriery is concerned.

9025. You have one lecturer in veterinary science?—We have not got a regular one, and I am very sorry we have not. We had to give it up last year because we had not sufficient money for it and several applications were made for lectures which we had to refuse.

9026. You have had a lecturer previously?—Yes; we have had lecturers.

9027. Have you had to give up anything else now we are on the subject of finance, or is there any probability of your having to give up anything else?—I should hope not at the present time. Of course, we have not taken up such subjects as agricultural engineering and the management of farm machinery. It is provided for, but we have not taken it up, or under-draining.

9028. There is not much probability as matters stand at the present time, of your being able to take those subjects up?—Not unless we can get more money.

9029. Do you yourself think they ought to be taken up?—Of course I am not an engineer and it is rather difficult to form an opinion as to whether we could do it in regard to agricultural machinery. I am inclined to think, in matters of that sort, that a little knowledge is rather a dangerous thing.

9030. I am not familiar with Wiltshire—do the large farmers in Wiltshire have smith's shops generally at their farms, and do some of the smaller repairs themselves?—Some of the very large ones do, but I cannot say it is usual.

9031. I see you do some work in fruit tree pruning and grafting?—Yes.

9032. How is that done?—That is done by lectures and demonstrations by a Mr. Sharp, who gives his full time. We pay him £100 a year. Of course, that is exclusive of expenses of travelling.

9033. Is that principally for the benefit of labourers or farmers or both?—Both. They are open classes and both come in; they are chiefly cottagers.

9034. Is an interest shown in that?—Certainly.

9035. That applies also, I suppose, to the next item, horticulture and gardening?—Yes, it is under the same man.

9036. Will you tell the Committee what you do in the way of poultry instruction?—We have a poultry instructor who is employed full time and his salary for one year is £140. Of course, I must point out that we have to cut our coat according to our cloth. I say we do it, but next year we may find ourselves unable to carry it on, but we have been doing it for some time.

9037. You have also some school gardens?—Yes, the day school gardens, of course, are under the General Education Committee, we have the evening school gardens.

9038. The day school gardens do not cost you anything?—No; we have nothing to do with the day school gardens.

9039. Does your committee spend anything on the day school gardens?—No, we spend a certain amount in advertising. In horticultural instruction, evening school gardens, teacher's courses, &c., our expenditure is £440.

9040. That is for the whole?—That is for the whole; it comes under one head.

9041. Is some of the day school garden work carried on by the General Education Committee?—All the day school garden work is done by the General Education Committee, but I have an understanding that when Mr. Sharp is in the neighbourhood, he shall cast his eye over the day school gardens: he is our servant.

9042. I see you do a great deal in your county for classes in what are called here “manual processes”?—Yes,

hedging, ditching, ploughing, thatching, and this year we have taken up sheep shearing.

9043. Those are attended principally by farm labourers, I suppose?—Entirely.

9044. Are they successful?—Very.

9045. You are satisfied with them?—Quite satisfied with them.

9046. I suppose you do not limit them to labourers. You would let a young farmer come if he wished to?—Oh, yes—in one place we went to there was a thatching class composed entirely of farmers' sons, and well-to-do farmers' sons.

9047. Do you attend any of these lectures yourself?—It is too big a county.

9048. I did not know whether you had attended them more by way of experiment to see how they went on?—No I cannot find time to attend them.

9049. Do you know whether, according to the reports made to you, the right class of people attend them?—Yes. I may say I have a general knowledge of what goes on, one makes enquiries, and the economists are always perfectly ready to supply one with information.

9050. I have not asked you any questions on the organisation in your county, because we had the advantages the other day of hearing Lord Fitzmaurice, and he practically told us of the system you had of the Agricultural Committee as distinct from the General Education Committee?—Yes. It is perfectly distinct. His Lordship was chairman, for a considerable number of years, of the Council, and he takes an enormous interest in County Council work. What he does not know of the work of the County Council is not knowledge.

9051. Would you confirm his opinion that that is a satisfactory system and works well?—Oh yes.

9052. That Committee does other agricultural work, only for those purposes it must be a distinct committee?—Yes, we act under the Fertilisers and Feeding Stuffs Act and the Dairies, Cow Sheds and Milk Shops Order. The Committee do that with the exception of the co-opted members. Of course, as you are aware, there are a certain number of co-opted members of the Agricultural Committee, and they withdraw when that business comes on.

9053. Your experience of that is so satisfactory that you think that it might be with advantage, perhaps, adopted in other counties?—It has worked very well for us, and I can only suppose that why we are so far far ahead of other counties is in consequence of our organisation; our analyses are more than twice as many as in any other county.

9054. Who acts as secretary of that committee. Have you a paid secretary?—The same man, Mr. Corbett, the Secretary of the Agricultural Education Committee, acts as Secretary for the other, too.

9055. You have a distinct permanent official of that Committee—not the secretary of the Education Committee?—Well, he is under him for general education work, and that alone. He is second man on the General Education Committee, he does our work and half his salary is put down to our debit.

9056. How often do your Committee meet?—We meet once a quarter, and then there can also be special meetings; there is a great deal of work one has to do oneself, and whenever I am in Trowbridge I go into the office and I have a great deal of correspondence; the corresponding part is very heavy.

9057. Is the Committee well attended when it does meet?—Yes.

9058. Is much interest taken in the discussions and the business by the members?—I think there is.

9059. The County is fully alive to the importance of the subject?—It is. The Council has been in a very economical frame of mind for some time owing to the general outcry as to the increase of the rates, but there has been no attack made upon my committee at all, and the general opinion seems to be that we are doing a good and useful work.

9060. I will pass away from that subject unless you have anything more to say upon it?—No.

9061. I see you have also classes for teachers in subjects relating to horticulture?—Yes.

9062. Elementary school teachers?—Elementary school teachers.

9063. Are those well attended?—They are well attended.

9064. Are they held on Saturday afternoons?—No, they are held during the holidays. We have a man, Mr. Hadley, who comes down from London and takes the scientific portion; the practical work is done by Mr. Sharp.

9065. What object have you in view by those classes?—To enable the teachers to carry on the school gardens.

9066. Do your Committee offer scholarships?—Yes.

9067. For men and women?—Boys.

9068. There are two classes I see, senior and junior?—Senior and junior. We offer two scholarships for the junior classes. We did offer two for the senior, but we had to reduce them, and we offer now only one for the senior.

9069. Where are those scholarships held?—The junior scholarships are held at the Dauntsey school and the senior at different places. At present I think we have two boys at Newcastle and in other places. There is no fixed rule about that.

9070. They are not limited?—Well, they are limited in this way that we only offer two a year. It is by competition.

9071. I mean they are not limited as to the place at which they hold them?—The juniors are, not the seniors.

9072. Provided of course that it is a college that you approve of?—Yes.

9073. What I wanted to make quite clear is that an intelligent young farmer has got an opening by which he can obtain the higher scientific knowledge in agriculture by means of a scholarship in your county if he is sufficiently qualified to earn it?—Yes. Of course we make it a condition that they are intending to take up farming, but I am not at all certain that some of the farmers' sons have eventually taken up agriculture. Of course it is very difficult for a young fellow to bind himself. He tells us that he intends going in for agriculture, and he really does intend going in for it, but after he has taken his course his ideas may alter.

9074. I suppose some of them become teachers in agricultural science?—I think so.

9075. Teachers in agricultural science of course must come from somewhere?—They must come from somewhere.

9076. And of course public facilities must be afforded for training those?—Certainly, but I understood your question to mean by agriculture as to whether they were intending to become farmers, and whether they actually did become farmers.

9077. I rather wanted to know both, but you have answered both questions, and I quite understand your view. I believe you have formed some opinion on the subject generally of grants from the Board of Agriculture for the purposes of agricultural education?—Yes.

9078. Perhaps you would briefly tell the Committee what your views are?—These are merely my ideas without having had an opportunity of discussing the matter with other people. I have simply put down what has passed through my mind on the subject. I would suggest that the Board of Agriculture make grants in proportion to the amounts expended from county funds, say something like 50 per cent. of the total expenditure, subject to the general approval of the Board. Inspectors should act as advisers, and not supersede the work of the responsible county officials; they should not seek the opinion of the teachers or instructors in reference to the administration. The teachers should look entirely to the County Committee as their masters. It would, I think, be bad in principle and in practice if the Board were to pay any part of their salaries. It might bribe some counties to engage teachers who perhaps do not yet do so. The work should stand on its own merits and not require bribing. Local authorities such as district councils are sometimes, I think, rather inclined to increase expenses such as salaries because it does not cost them anything, or at all events, very little. Any portion of the salaries being paid by the Board of Agriculture would, I think, put the Committee in rather a false position. The grant should be made for the work as a whole, the same as the Board of Education proposes to do under Section 34 of the Regulations governing Evening Classes. These are merely suggestions, I do not wish to put them as a strong opinion; it is what has occurred to me.

9079. If I may be permitted to say so, they are rather valuable suggestions and the result of your experience. In your opinion it is desirable that the county should remain the unit, and should control and organise the work?—Yes.

9080. But with the assistance and supervision of the Board of Agriculture as representing the State?—Yes.

9081. And that under no circumstances should the

Mr. C. N. P.
Phipps.

19 June, 1907

Mr. C. N. P.
Phipps.
19 June, 1907

salaries of teachers be paid direct by a central authority ? —I think it would be a mistake. I think if that was done the teachers would come to consider that they had got two masters.

9082. I have in my hand an extract from a newspaper containing a report of a meeting of your committee at which I see you yourself proposed a resolution which was unanimously adopted. Would you give the Committee some comment on what the object of that resolution was. I will not read it, it is rather too long ?—We were asked by the General Education Committee to join in an application to the Board of Education for a block grant. The matter was discussed, and bearing in view this Committee which is sitting now and what might be the result, I thought it most desirable that we should not tie our hands in any way, and we said we would under certain conditions make an application for a block grant for one year as an experiment, that we must be entirely distinct from the General Education Committee, and that all communications on the subject of agriculture should come to us direct. A copy of that resolution was sent to the Board of Education, and a copy was sent to our General Education Committee.

9083. Have your General Education Committee consented, do you know ?—I do not know anything further on the subject, it only took place the other day.

9084. You have in your county a very important school which is marked on that map—the Dauntsey School, at West Lavington ?—Yes.

9085. I think the Committee would very much like to hear your views on the usefulness of that school and the position it occupies. Are you a member of the governing body ?—No, I have nothing to do with the school except the general knowledge that an outsider has and from matters that have come before me as chairman of the Agricultural Committee in connection with this school.

9086a We are to have witnesses from the school, and no doubt they will give us their views from the inside, but your views from the outside would no doubt be very valuable to us ?—I attach very great importance to the school indeed. It is a most admirable school in every way and might be of the greatest assistance I think to agriculture. From what I hear—I may be mistaken—the school has been rather changed from its original purpose as an agricultural school, I understand, in order to obtain a grant from the Board of Education as a secondary school. I take it the Dauntsey school, like all these schools, is in want of money. I have had considerable correspondence with the chairman of the Mercers' Company on the subject of being in closer contact with them and finding more money. We do make a grant of £100 a year to them, besides sending our junior scholars there. I cannot think the policy a wise one—that is, the policy of obtaining a grant from the Board of Education as a secondary school—from the agricultural standpoint. It is the only agricultural school in the county. To meet such cases I would venture to suggest that the Board of Agriculture should give capitation grants for agricultural secondary schools, which at present they cannot do except to university colleges and farm schools and the like, although the Board of Education can. My idea is that all agricultural education should be carried on under the Board of Agriculture and it should not be placed at a disadvantage financially compared with the education given by the Board of Education. The two Boards should be placed on equal terms as regards the power to make grants. It is an admirable school in every way and is very well thought of by the farmers of the county, many of whom send their boys there.

9087. Your county have no field experiments or demonstration plots as many counties have ?—No.

9088. Neither do you give lectures nor instruction in the principles of agriculture, or in practical agriculture, manuring, and so on ?—Yes, we do.

9089. How is that done ?—You mean as far as the farmers are concerned ?

9090. Yes.—In our horticultural lectures and subjects, orchard management, school gardens, allotments, and so on. The county instructor in horticulture instructs on manures, solid and liquid, animal manures, food they contain, green manures and their value, chemical manures, food they contain and their use, and effects of manures. I know a good many farmers attend those classes.

9091. Those classes are intended primarily for gardening and not for farming ?—Primarily for garden and not for farming.

9092. I see by the return that you have a considerable area of woodland in the county ?—Yes.

9093. Do you attempt anything in the way of instruction in forestry ?—No, we have not done so.

9094. Are skilled woodmen difficult to obtain ?—I do not think so.

9095. You do not give any instruction in manual processes ?—No, they learn that on the estates under the forester.

9096. I believe Lord Bath's estate is in your county ?—Yes.

9097. I have been told, I do not know whether it is the fact, that his woods are among some of the best managed in England ?—Yes, I should think they are; they have been well managed for a great number of years, but I do not know that they are better managed than those of Bowood or Savernake.

9098. At any rate, as far as you know the woodlands are well managed in your county ?—The woodlands in the county are well managed; certainly our large woodlands are well managed.

9099. (By Lord Moreton.) Would you tell us what the age is for the junior scholarships ?—The junior scholars must be under 17 years of age on the 1st of May.

9100. And the senior students ?—They must be under 20.

9101. I do not think you told us for how long the scholarships are tenable ?—For two years, but they might be held for longer under certain circumstances.

9102. You made mention just now of a thatching class which was attended entirely by farmers' sons ?—That was one particular class.

9103. Was the idea that it should be only attended by farmers' sons ?—No, I do not think it was. It was because it so happened; it was at a place called Broughton Gifford, sufficient came to make up a class. They were not worked up.

9104. Then it was not that so many farmers' sons attended that it debarred the labourers from attending ?—No, because there were classes for the labourers as well. That was one special class which was got up locally.

9105. (By Mr. Acland.) In your county you have had for some years past a fairly complete scheme of secondary education ?—Yes.

9106. Do you, looking at the agricultural work, think that the maintenance of a complete system of secondary schools has been an advantage in preparing boys for higher agricultural instruction ?—I am afraid that is not a question that I am able to answer, because I have really no knowledge of the work of the General Education Committee. I find the work of my own committee enough to do.

9107. Is there a feeling among those who are particularly interested in agriculture that the money spent on secondary education has been well spent, or the reverse ?—There is a very great difference of opinion on that subject. Just at the present time there is rather a strong feeling in the county about secondary education.

9108. Do you find the boys who come for one sort or another of agricultural instruction of, say 16 or 17, are more fit to receive it from having been to a secondary school ?—I should think very few indeed, with the exception of the Dauntsey boys have been to a secondary school, certainly not in the country districts.

9109. It is not the habit in your county to go from the elementary school to the secondary school, and then to go on to receive higher agricultural instruction ?—No; you see the secondary education of the county is pretty well confined to the towns and to the immediate neighbourhood of the towns; it cannot be said, I think, to permeate into all the country districts. Wiltshire is a peculiar county, with large open tracts of Down, and other parts of the county where there is a considerable distance between the towns.

9110. You would not say that the success of your agricultural education has been yet much affected by the spread of secondary education ?—I do not think it has been.

9111. (By Dr. Somerville.) I notice that you go to London for an expert to conduct the examination of the dairy school ?—Yes.

9112. You have no doubt considered the claims of institutions that are nearer, and rejected them. In point of fact, do you never feel any necessity for affiliation with some central institution ?—I cannot say that I have personally. I found Professor Lloyd was the examiner

when I became Chairman of the Committee; it seemed to work very well, and we have continued him. There is no institution much nearer to us than London.

9113. I think I could name some?—I dare say—for my own information, if you would not mind, I should be very glad to hear them.

9114. I could, of course, name Reading, and Cirencester and Bristol, but Bristol is not equipped yet, and I think there was an institution in your county at Downton?—Yes, there was.

9115. The fact that you do not utilise it shows that you do not feel the need for it?—I think we are extremely well served by Professor Lloyd. I do not know that we could be any better served at Cirencester, speaking with due deference to Lord Moreton, and I do not think we could have been any better served at Downton.

9116. There might, of course, have been a personal examination if you had been in nearer touch with your examiner. I suppose Professor Lloyd does all the examining by paper?—Yes, the paper work, and Mr. Gibbons comes down and does the practical examination.

9117. Mr. Gibbons conducts the examinations for all your dairy courses?—Yes, he takes the practical part.

9118. I see you suggest it would be an advantage if the support from public funds that Dauntsey obtains were given rather in the shape of a capitation grant than as at present arranged. I suppose you perhaps hardly mean a capitation grant in the sense of so much per head, but rather a block grant, do you not, upon the teaching?—The result, I think, would be the same. My view is that the tendency of getting a grant from the Board of Education will be rather detrimental to agricultural education. Speaking perfectly frankly I do not think that the Board of Education have the same sympathy with agricultural education that I believe the Board of Agriculture has.

9119. I believe the history of that school is something like this, that 10 or 12 years ago very few of the boys were in the so-called agricultural form?—The whole thing has been altered; it is a very very old school and there was a new scheme prepared. The whole thing has been altered, I suppose, 12 or 15 years ago. The buildings are completely new.

9120. I rather thought a change came over the school when they got their present headmaster, and before that very few boys were taking the agricultural work and that since then practically every boy in the school was going through the agricultural form?—Yes, I do not know that that is quite so, but of course Lord Moreton will know. The schoolmaster that Mr. Solomon succeeded came from the North. Mr. Solomon is a very able man indeed, and has, I believe, been a great success.

9121. I know at that school the Board of Education compelled the boys to take up certain other subjects that are in no sense agricultural; amongst others, French and mathematics?—Yes.

9122. Of course mathematics may be useful to anyone, but your idea was that boys were under no necessity to take such a thing as French if they were going in for farming?—I do not quite see the object of it. If a man is going to be an ordinary British farmer, I do not quite see the object of his learning French and German and sundry other things.

9123. I think most of us will agree with you in that. You have in Wiltshire a trained expert agriculturist who is capable of giving sound instruction?—Sound all-round instruction for agricultural purposes?

9124. Yes.—Yes; an admirable man.

9125. Yet you conduct no field experiments, which rather shows that you differ from other counties in not considering these local demonstrations desirable and useful for farmers?—It is not for that reason, it is simply a case of *res angusta domi*; we have not got the money. I should like to see poultry stations, and I should like to see stations for horticultural work, and farm work, but the fact is, we have not got the money for it.

9126. You possibly have seen the so-called field experiments and local demonstrations in other counties?—I have not seen them, I have only heard and read about them.

9127. At any rate, you have no specific objection to them?—No.

9128. Possibly you may almost have a specific inclination towards them if you had the means?—I have no personal objection to them of any sort.

9129. (By Mr. Latham.) Would you have any objection to my seeing that book from which you quoted the passage

from Professor Lloyd's report?—That is it. (*Handing document*). I brought these papers with me on the spur of the moment, because it is very difficult to answer questions as to detail from memory.

9130. Your general agricultural instruction is not given at any centre?—No, in nothing.

9131. It principally consists of these dairy schools and cheese schools?—Yes, and farriery and man al processes.

9132. Will you just kindly explain what they are?—Hedging, ditching, ploughing, sheep-shearing, rick-making and thatching.

9133. That is for the labourers. I am speaking of farmers or the sons of farmers in the district. Is dairy and cheese-making and butter-making the whole of the agricultural teaching?—So far it is; mind you, it is open to them. There is no reason why a farmer or a farmer's son should not attend our classes; they are open.

9134. I quite understand. As far as science is concerned you have no classes?—No.

9135. Do you get as much money from your County Council now as ever you did for agricultural education?—We used to get more before I was chairman, and we are getting a little more now than we did last year, but one has to fight very hard for it indeed.

9136. I suppose the 1902 Act has been rather detrimental to agricultural education?—On account of the boys?

9137. On account of more money being given to secondary education agriculture has suffered?—I think so. I may say that we have extremely stiff fights. I have to fight for agriculture very stiffly indeed.

9138. Professor Lloyd in what he says here rather condemns the teaching than otherwise, does he not?—It may be taken in that way, but I do not think he does, really.

9139. May I not take it in another way that he contends you do not go far enough?—You may.

9140. And that it would be very beneficial to your dairy teaching if you had a home for it?—If we had a regular home; but then I think the difficulty about that would be in getting the pupils to attend. You know Wiltshire as well as I do, and you know how difficult it is to get about the county—means of communication are very bad, and so far as butter-making is concerned I doubt very much whether we should be able to get them to attend centres the same as we do with a peripatetic school.

9141. You have never had any lectures in the county on any specific subjects, I think?—We have had veterinary lectures.

9142. I was speaking particularly of the dairy school?—No, not as regards dairying.

9143. There has been a great deal of feeling in your county that the milk standard is too high?—Yes, I think there is amongst the farmers. Milk selling, which has become a very large trade indeed, militates to a certain extent against butter-making and cheese-making.

9144. I quite agree, but do not you think there might be a great deal of useful information given to the farmers on this particular question?—Yes, I think there might—you mean as regards feeding?

9145. No, I do not think feeding has one atom to do with it: management generally and the method of milking. If you had more money to spend, and lectures were given on market days in the market towns to the farmers generally do not you think it would be very beneficial to the industry?—I should think it would.

9146. Would not those remarks apply to cheese-making if you could get lectures given by men of some considerable experience?—I do not quite see how it would with regard to cheese-making.

9147. Cheese-making in England has been considerably improved during the last few years, has it not?—Yes, but I think an ordinary lecture on the making of cheese on the afternoon of a market day would scarcely do much good.

9148. You can scarcely have classes without having cheese schools?—We have; we have one at Erlestoke Farm at the present time.

9149. Are they moved periodically about the county?—As I said just now, we had to give them up, but we are starting them again.

9150. Will they be movable?—You mean will they be here this year, there next year, and somewhere else the year after?

Mr. C. N. P.
Phipps.

19 June, 1907

Mr. C. N. P.
Phipps.
19 June, 1907

9151. Yes—We chose the farm at Erlestoke because it was a good centre. Of course it is no good trying to make cheese down in South Wiltshire.

9152. I agree, but that is not exactly what I mean. Is it not your experience that if you give education you have got to take it to the people. They will not come to it?—Very much so.

9153. That is expensive?—Yes. You see, as regards moving your school, several considerations apply. You have got a great many things to think about and to contend with. You have not merely to think about your instructor; you have also got to think about a suitable farm house with accommodation either there or in the immediate neighbourhood for the pupils, with a proper place for making the cheese. This Mr. Rogers is a practical farmer and a practical cheese maker.

9154. Would it not be very beneficial if Mr. Rogers could go round to the several farm houses in the district and give them instruction?—He does pay visits now of that kind.

9155. I have much pleasure in speaking as to the excellent way in which your butter schools are managed, but I feel like Professor Lloyd that you do not go far enough to give them the education that is necessary, and I have no doubt you would like to see it increased.—I do not quite read Professor Lloyd's remarks in that sense. His argument is that the pupils are not sufficiently educated to start with.

9156. I quite agree.—That the general education is not sufficiently good to enable them to secure the full benefits of the school. I do not understand, and I never have understood from Professor Lloyd when I have discussed the question with him that he found fault with our instruction. It is with the education of the people before they come into the school.

9157. I quite agree with that. But Professor Lloyd says, "the practical knowledge of the pupils seems to begin merely with the actual treatment of the cream given them to churn"?—Yes.

9158. Of course there is a great deal in the management of the cream before it comes to the pupil which cannot be taught in the actual dairy, and it must be done in the home?—It must be taught in the home.

9159. Professor Lloyd also says that everything depends on that in practical butter making?—Yes.

9160. So that there is a great deal that should be taught the pupils that you are unable to teach in your present dairy school?—Yes. It would take too long where we have to get over a certain amount of ground in a certain time. If you had your school here, Mr. So and So there might say: "When are you coming our way; why do not you come to us; you must come," and so on. There is a deal of pressure put upon you as regards these travelling schools.

9161. I quite agree with you. You made an assertion that the butter trade does not very seriously improve?—What do you mean by the butter trade?

9162. The butter trade of Wiltshire?—As how?

9163. The butter as made after your pupils have left your schools?—I was not asked that question, pardon me. The Chairman asked me about the butter trade as an export trade from the county, and not the question you put to me now.

9164. May I ask you to answer my question?—Will you ask it again?

9165. Do you consider that your teaching in dairy schools has raised the butter industry of the county?—I certainly consider that there is much more good butter made in Wiltshire than there was some time ago.

9166. At the same time you do not consider it has raised the price?—No, it has not raised the price. I was asked that question, but as regards the trade, I understood the Chairman to ask me with reference to export trade.

9167. Do you consider the commercial aspect of the butter trade is seriously improved by the teaching that has been taught in the dairy schools in your county?—I think there is certainly a great deal more good butter made in the county, but if you ask me whether the result of our instruction in dairying, butter making in particular, has been that more money goes into the hands of butter makers, I must express my doubts on the subject. I do not think it has, but I am hardly in a position to say. My impression is there is not more money coming into the county.

9168. I think that is the case in many instances where the education has been more general and more thorough.—Yes. You see of course you would be able to form a very much better opinion upon that point than I can. I mean as regards the commercial side of the question.

9169. Now with regard to your farriery schools. I think your farriery schools began just about the time that the Bath and West of England schools began. I knew Lord Winford very very well, I worked under him for a good many years, and I take his position on the Bath and West of England now.—I know you do.

9170. Your schools started about the same time as the schools of the Bath and West?—Yes.

9171. The work has developed by immense strides since then, and a great deal of good has been done?—Yes.

9172. You spoke about a travelling farriery van?—Yes.

9173. Did you have a veterinary surgeon go about and lecture?—Yes; Mr. Bazley, of Devizes.

9174. There is not the slightest feeling among the veterinary profession in the district that your teaching is going too far, is there?—Not the slightest.

9175. You made a remark that you did not wish it to go too far so as not to cause any feeling in the veterinary profession?—It is not going too far; the relations between us and the veterinary surgeons of the county are very good indeed.

9176. I think I may fairly say that the farriery instruction in shoe making and placing them on the horses' feet has been generally approved by the profession at large?—Yes. You will remember at Nottingham the difficulty there was about the shoeing, and that it was pointed out at the Bath and West of England Show how bad the shoeing was, and it was remarked to you that they had no school of instruction.

9177. With regard to your scholarships, I think you made a remark that they were not freely taken up?—No, they are freely taken up, but in the higher scholarships we have only one because we have not money for more. There is a good competition, however, for them every year.

9178. By agriculturists?—Yes, we give the preference to farmers' sons.

9179. At the same time you almost fear that they do not return to agriculture after they have gone through the course?—I cannot be certain whether they do or not. I understood the question of the Chairman to be as to whether they went back on the land as actual farmers.

9180. That is what I want to know?—That I am a little bit doubtful about.

9181. Then the higher education we may almost infer from that is detrimental to the general farming interest?—I do not know that it is because as the Chairman pointed out many of them become science instructors and teachers of scientific agriculture.

9182. I am speaking of the actual farmer?—Yes, I agree with you.

9183. With regard to your not doing any experiments, do not you consider that must be a rather serious loss to the county?—I think so. I think it would be a very good thing if we had them, but it is a question of money.

9184. In consequence of your doing no experiments I suppose it is fair to take it for granted that the value of artificial manures is very little known and very little sought after in Wiltshire?—I do not agree with you there. I think there is considerable knowledge of artificial manures throughout the county, especially amongst the big farmers, the evidence of that I think is their keenness in having fertilizers analysed.

9185. I quite agree with that, but where do they get the education from?—That I cannot tell you. I suppose that they picked it up or it grew with them.

9186. This is the first time I have heard about it growing with them. Why do you have any objection to farmers learning languages?—Because I am inclined to think if they are going to be farmers pure and simple, at the top of Salisbury Plain for example, the time occupied in learning French or some other language might possibly be more profitably employed in learning something else more closely connected with agriculture.

9187. That may be possibly true, but we are so closely connected now with institutions abroad that anything in the way of acquiring some knowledge of languages would be useful?—Of course from the abstract point of view it would be useful. Knowledge is useful to everybody, but

whether a knowledge of French or German or Italian or anything you like to name is going to benefit the British farmer in the carrying on of his work I have my doubts.

9188. I suppose it is quite fair to ask the question; if you had more money you could usefully employ it?—Yes.

9189. (*By Mr. Medd.*) You are certainly in favour, are you not, of having the whole agricultural education under the Board of Agriculture?—Certainly.

9190. You have applied, I understand, to the Board of Education for this block grant for at least a year?—Whether it has gone forward or not I cannot say, but we sent a copy of the resolution that was passed to the General Education Committee. Whether it has gone up or not I cannot tell you.

9191. You are aware probably that the Board of Education is extremely anxious to control all agricultural education?—I have an idea that that is so.

9192. Has it ever been suggested to you that the Board of Education in offering this block grant under Clause 34 of the Technical Day School Regulations desire by so doing to get control of agricultural education?—It has never been suggested to me, but it certainly has occurred to me. Perhaps I might say why I am rather afraid of the Board of Education—*Timeo Danaos et dona ferentes*. We should very probably be under the Board of Education and under its inspection and they would send down most excellent and worthy gentlemen to see what we were doing, but I am very doubtful whether they would have any knowledge of country life or country people from what I have seen of them: I saw a couple the other day.

9193. In future, of course, a certain portion of this block grant will be allocated to agriculture—that you hope, at any rate. With regard to agricultural education itself, do you not think that its interests may be advanced and protected by the formation of a Consultative Committee in London of representatives from different counties and different agricultural societies to keep each county in touch with the others and to bring pressure upon the Board of Agriculture and upon the Government?—I have never thought of that, and it is rather difficult to express an opinion upon; it is rather a wide question, in anything of this sort you want a permanent body.

9194. I have submitted the question to many witnesses, and I must say they have all agreed that such a consultative committee is desirable?—It would be a good thing, but on the spur of the moment I would not like to express a strong opinion.

9195. I can quite understand that. With regard to

Dauntsey, Dauntsey is under the Board of Education at present, is it not?—Yes.

9196. You would prefer, I take it, to have it become definitely an intermediate agricultural school under the Board of Agriculture?—Certainly from the agricultural standpoint, because we have got nothing of the sort in the county, and the county is pretty well studded over with secondary schools.

9197. Perhaps you would agree with me that a school which serves a definite aim is better than a school which seeks to serve two aims?—I think so.

9198. In other words, Dauntsey to some extent must necessarily suffer from having an educational combined with an agricultural aim—I mean educational apart from agriculture?—I do not think it need necessarily do so, but what I am afraid is likely to happen is that agriculture may be pinched out of Dauntsey.

9199. You would distinctly prefer to have it as an intermediate school under the Board of Agriculture?—Yes, certainly.

9200. That is what one has been advocating for years. I suppose there is no possibility of the resuscitation of Downton?—No, I do not think there is.

9201. Would you object to submit annually to the Board of Agriculture a scheme of the agricultural education which you propose to give in Wiltshire for its advice and suggestions?—Certainly not, if we were going to get more money.

9202. The only desire is to try and systematise it, and the more one systematises it the more likelihood one has of getting money?—Yes.

9203. (*By Lord Barnard.*) We have been told in many counties which are in touch with collegiate centres that the farmers acquire a habit of asking advice and opinions from scientific men on various difficulties which arise in the course of their business. Having no agricultural lecturer you have nobody to whom a farmer can go to in Wiltshire for such advice—no scientific man?—We have not.

9204. Do you think if such advice were made available that in the course of time farmers would, as they have done elsewhere, learn to make use of it and to appreciate it?—I should hope so in course of time.

9205. We have been informed by other witnesses that it has taken years before they have done so, but they almost invariably in every case have done so in the end?—That rather covers my answer that I should say in course of time they would.

Mr. WM. McCracken, called and examined.

9206. (*By Lord Barnard.*) You were formerly Professor of Agriculture at the Royal Agricultural College, Cirencester, and you are now agent for the Earl of Crewe's estates in Cheshire?—Yes.

9207. How long have you held that appointment?—About 17 years.

9208. Previously to that you had experience as a Professor of Agriculture at Cirencester?—Yes.

9209. You are prepared to give the Committee some information on the subject of agricultural teaching in Cheshire as at present carried on?—I have had to do with that in connection with the County Council and before the County Council was started.

9210. Are you at present a member of the County Council?—Yes.

9211. And a member of the Education Committee?—I am.

9212. Has that an agricultural sub-committee?—Yes.

9213. Are you Chairman of that by any chance?—No, I am not Chairman. I have kept a little out of the working of it on account of being Examiner for the National Diploma and so as not to be too much in contact with the students, some of whom I have to examine.

9214. You wish to inform the Committee of the origin of agricultural teaching in Cheshire?—Yes, that was started about 1889, I think. There were five landlords who guaranteed the salary of a lecturer, and we engaged a lecturer, a Cirencester man, and he visited chiefly the

grammar schools and other schools as well, and went about amongst the farmers a good deal and he got to know the farmers and to know the farming of the county and did a great deal towards laying the foundation for what was done afterwards.

9215. That was in 1889, the year the Councils were established?—Yes, but before the County Councils had taken up the subject of agricultural education.

9216. Then the County Councils some years afterwards took over that work?—Yes, they took over the work and engaged some more itinerant lecturers on the same system and then they gradually settled down to have a college with a staff there.

9217. We have had very full information from Holmes Chapel and from Worleston so that we need not trouble you unless there is anything special you wish to impress upon the Committee with regard to those schools?—No.

9218. You consider that lectures are of use to farmers?—I think they are of very great use if the lecturer is in touch with them. I know in that case they were because he got to know the farmers and they had confidence in him and that led them to send their sons.

9219. This system of lecturing still prevails in Cheshire?—Not outside lecturing much; it is chiefly inside the College.

9220. Why have the county ceased to give outside lectures?—I think they got nearly as many students as they could accommodate from almost the beginning. In the first instance outside lecturing had no connection with

Mr. C. N. P.
Phipps.

19 June, 1907

Mr. W.
McCracken

Mr. W.
McCracken.
19 June, 1907.

the college, because the College was not thought of then, and afterwards it was carried on in order to create an interest in the county, but now I think the interest is considerable all over. There was a very great deal of prejudice to overcome in the first instance, but that has been overcome, and now there is not the same need for itinerant lectures, although I think more of it might still be done profitably.

9221. You have experimental plots in the county?—Yes, but that branch has not been developed very much. I think it ought to be done more.

9222. You have an experimental farm at Holmes Chapel?—Yes, there is an experimental farm there.

9223. So that unless you want to differentiate from what goes on at Holmes Chapel do you think the experimental plots elsewhere are not necessary?—Yes, I should think they are, because the soil differs in various parts, and I think experiments should be carried on in several different places because it is a drift soil at Holmes Chapel and most of the soil in Cheshire is on the red sandstone marls which are considerably different.

9224. You think the itinerant system is not of very much use to the farmers owing to the college system, and you think also it is of very little use to the small holders?—I do not mean exactly to say that. I think it would be better if there were more outside lectures than there are at present to keep up the interest and if there were a few experimental plots in different parts of the county to show the different results of the manures on different soils. I think farmers would get to appreciate the pounds, shillings and pence of it better in that way.

9225. The farmers know the Holmes Chapel School and have confidence in it?—Yes.

9226. They apply a great deal to them for information on different matters?—They do.

9227. You have an idea that practical schools for small farmers' sons and labourers' sons for the manual work of a farm would be an advantage?—I think they would.

9228. Would not they be very expensive to establish and maintain?—Unless they could be worked in conjunction with some other institutions they would be expensive.

9229. Do you know anything about the Farm School at Basing?—No, I know nothing about that.

9230. Or the Newton Rigg Farm School in Westmorland?—No.

9231. They are both excellent institutions, and the class for whose benefit they exist cannot afford to pay anything for the instruction?—That is so, and I do not think it would be any use unless the equivalent that they would be earning for their parents, in addition to the fees for the teaching, were in special cases provided for them. That is done in some cases by the County Council.

9232. So that it would be a very expensive matter to carry out such a scheme as that?—It would be, no doubt. Might I just add to that that I think if there were something in the way of technical schools for labourers and small holders it would be an advantage? In Cheshire we have an immense number of small holdings, and I think the teaching for those people ought to be quite different from what is taught at the college, so as to avoid those labourers' sons from getting out of touch with their work at home. They should be kept absolutely in touch with their work the whole time, and kept in training for it, because one notices that a good many of them go off to other, and in some cases less advantageous, occupations if they are taught too many outside subjects.

9233. Are many of these small holdings vacant?—None.

9234. Then some of these boys must therefore drift away to other employments because there cannot be a living for them to be earned on the land?—That is quite true, and many of them do. There are an enormous number of works in the county and they go off to those.

9235. You wish to give the Committee some views as to the present value of the work which is done by collegiate centres, I think?—There is a tendency in many councils to concentrate slaughter-houses to facilitate inspection. I know we have had it under consideration in our County Council a good deal, and I think in connection with colleges some of those slaughter-houses should be open to students to have a right to go and see the animals before they are slaughtered and examine them carefully, and perhaps have competitions as to their weights and value and then see them after they are slaughtered. Their veterinary as well as their agricultural professor might accompany them. That would be of great use because many of them lose

touch with values while they are at the college. When boys leave college they very often have the vaguest ideas as to the actual value of sheep and cattle, and they are sometimes very much out of touch with that when they go back to practical farming.

9236. That is a matter which should be corrected by the managing body of the institution if pressure could be brought to bear upon them either by the public who are interested in the question or by the Government inspector. It is a detail really?—Yes, it is; but I think it is a very important detail.

9237. Are you of opinion that such a point as that can be taught sufficiently well in a college instead of being acquired by practical experience?—I think a student could learn a very great deal in that way, because if he saw the animals alive and had an opportunity of handling them and of judging their weight, and were then to see them after they were slaughtered and to see them weighed, it would be a very good experience. I do not think he could get much experience from attending an auction mart.

9238. Most of the witnesses before this Committee and most of the writers on the subject, and probably, I think, most of the members of the Committee, are agreed that science in agriculture is valueless without practice; is not that just one of the questions which can only be dealt with by practice?—I think it is a connecting link.

9239. You think some instruction should be given in it to give students an intelligent mind on the subject to enable them to acquire knowledge afterwards practically for themselves?—Yes, when a boy leaves college he goes home, and if he has brothers who perhaps have not gone to college they probably know more of the values of live stock and farm produce than he does, so that he may have a good deal of unnecessary lee-way to make up.

9240. We have been told by most of the witnesses here that, in their opinion, for a man who is actually going to farm the land, it is very desirable before he commences his scientific instruction say at college, that he should have had practical work on a farm, generally, of course, on his father's farm?—Yes.

9241. He would hardly forget the practical knowledge he had learnt with his father during the two or three years at which he was at college?—No; only he is at such an age when he goes to college that he would not have been able to acquire much knowledge as to the values of stock, and if he is perhaps three years away he loses that time in what affects his success as a farmer eventually, most of all, and if this instruction were given, he might have an opportunity at college of learning what he could not get at home at all.

9242. You do not think that the bulk of the practical farmers of this country are turned out from college?—No, I do not.

9243. Education at a college is not a *sine quâ non* for a practical farmer?—No, but it gives him a great advantage over those who have had no college training.

9244. College education is rather for men who are intending to take up positions as science instructors and teachers in agriculture, and so on?—I do not know that that is the view taken in some other countries where they consider science is necessary for the practical farmer and that it helps him to make farming pay.

9245. You mention here the facilities that are given in America. Have you been to America?—No. I have never been to America.

9246. Perhaps you read the American publications?—I have known a good many people who have judged at shows there and who are fairly conversant with what is going on in the country.

9247. You tell us that this system which you advocate is actually in operation, of giving students facilities of judging live stock?—That is at certain of the shows; they take them round the shows before the judging is done, and each student has to judge for himself and then afterwards compare his results with those of the official judge.

9248. You think drawing would be of value as an aid to agricultural education?—As an examiner one misses it very much now. In replies to questions on implements and in many other departments such as botany and veterinary physiology, for instance, I do not think more than five per cent. of candidates are able to make a rough but accurate diagram of what they are asked to describe.

9249. That is a deficiency in the general education of the country rather than in agricultural education?—It is, but one finds it out in connection with agricultural education. I believe the elementary education department generally are trying to improve the instruction.

9250. Of course you do not want to turn out exhibitors at the Royal Academy, you just want them to be able to make a very rough sketch so as to be able to illustrate what they mean?—Exactly. I think nothing does more to train the powers of observation and to impress the essential features of an object upon the memory than making a careful drawing of it.

9251. The scientific portion of the training, you say, should be accurate and scientific. Have you any reason for supposing it is not accurate and scientific?—Not generally; but in some cases too much stress seems to have been laid upon making the teaching *popular*, the result being want of accuracy and of a clear grasp of the subject.

9252. Where are these examinees that you speak of trained?—One only knows them by numbers.

9253. (By Lord Moreton.) Are you referring to these examinees for the National Diploma?—Partly for that, and partly for the Surveyors' Institution.

9254. They would be very much of the same class?—Yes.

9255. So that they would have had very much of the same class of education before they came to you?—Yes, very similar.

9256. Probably that would be the highest class of education?—Yes.

9257. (By Lord Barnard.) You have an idea that agricultural teaching is rather too local. Would you explain what you mean by that?—What one finds in a good many candidates coming from particular institutions is that they only know the agriculture of their own neighbourhood or that of the institution where they have been taught; they do not seem to be much taught as to the practices which prevail in other districts which might be profitably applicable to their own.

9258. I believe Scotchmen come to places all over England from the Scotch colleges, and some Englishmen go to Scotland to be trained?—Yes, a great many.

9259. Would you agree with me in thinking although in the case of some men who were going to take up agricultural teaching or the work of agricultural analysts, or traders in agricultural manure or agricultural business of some description, it may be very desirable that their knowledge should not be limited to a certain district, yet, on the other hand, we know how farmers do remain in the one district, and for the actual practical farmer it would be very useful to him to have the actual local knowledge?—I quite agree that local knowledge is of the first importance to a farmer, but a wider acquaintance of other districts might often help him to improve his methods and to enable him to adapt his practice to changes of times and circumstances.

9260. It strikes me if you are going to get your students, particularly smaller farmers' sons or even larger farmers' sons, to go to institutions far away from their homes you are adding to the cost of training them?—I was not meaning that so much as their being taught in the lecture room or on the farm what other practices might have been adopted for the growth of a particular crop, and how stock are treated in different parts of the country. For instance, one observes it a good deal in the case of examinees from dairy farms; they know the dairying practices thoroughly, but a great many of them know nothing at all about sheep or any other department except what comes directly under the head of dairying. I do think if the Board of Agriculture could do something by giving to a few of the very best men some travelling scholarships it would be a very great advantage to those who are going to teach afterwards.

9261. Would it be your opinion that those travelling scholarships should be given by the County Councils or the Board of Agriculture, because again it means money?—It does, but it would be very much better if it were done by the Board of Agriculture, because the County Councils are so much hampered by the question of rates that it would hang fire I'm afraid if it were left to be done by the councils.

9262. You are making a suggestion which is new, that is that the Board of Agriculture should itself actually expend money in scholarships. Up to the present that has never been done at all?—Well, the grants might be given to the County Councils to expend it in that way. I think it would be a very great thing for the future training of teachers, at any rate.

9263. (By Lord Moreton.) I should like to ask you, with your great experience of the National Diploma examination, whether you think it would be an advantageous change, instead of holding it on the present lines, to have it conducted by two national societies, and to hold it under the superintendence of the Board of Agriculture, with an advisory committee of experts and agriculturists, and, instead of holding it in one centre as it is held now, to hold it in various centres of England, according as there might be a suitable crop of candidates, and make the examination of a much more practical nature than it is possible to do at present. They might, for instance, take a student for a walk on to the farm, and "pick his brains" with regard to his knowledge of agriculture and natural science in the way of entomology, botany, and so on. Would that, in your opinion, be a move in the right direction, turning it if possible into a more practical examination?—The examination would be more practical, and it certainly would be more efficiently conducted, if the practical part could be introduced as your lordship suggests, and I think probably it would give weight to the examination if it were under the Board of Agriculture, perhaps in conjunction with a committee of the two societies, the Royal and the Highland. If it could be done so as to maintain something like an even standard it would be an advantage, but that would be perhaps more difficult than if the examinations were conducted at one centre. Of course when they are examined at one place you have an absolutely even standard.

9264. That was the principal reason why the two societies instituted the examination as they did, was it not?—It was. Would it be worth superseding the examinations of the colleges themselves for the more local part of it and retaining the other as the ultimate and national examination?—that would be my idea.

9265. You have asked me a question, and I will retaliate by putting it to you. What would your answer be to that question?—I do think on the whole that one central examination would meet the purposes for which that particular examination is held better than having local examinations at different centres.

9266. Of course we know your long connection with Cirencester. Do you consider that Cirencester as an agricultural college is well equipped and well situated for the purposes for which it exists?—I do.

9267. Do you think the curriculum is suitable for those who go there—in other words, sons of landowners and men who are going to become land-agents, and also a certain number of agriculturists?—For that purpose I believe it is.

9268. You think it is a practical and suitable curriculum?—Yes, for that purpose.

9269. A great deal of attention at present is being turned to forestry. Do you agree with me that Cirencester is unusually well situated for a student to study Forestry, considering the very well-managed woods of Lord Bathurst that there are in the neighbourhood and the not very far distant Forest of Dean and other wooded estates?—I think there are certainly very great opportunities there.

9270. (By Mr. Acland.) May I ask you just this big question about the present grants given by the Board of Agriculture. First of all, whether you consider the money at present distributed could be better distributed, and secondly in what directions you think more money, if there were more money available, is most needed in the country as a whole?—I do not know that I have thought that carefully over, but it seems to me in some districts it would not apply but, in the districts that I know best, where there are a great many small farmers, a certain amount ought to go towards paying their expenses, or rather, reducing the cost of their education. In many parts where there are small farmers there is great difficulty, not that they do not want to go or that they are not intelligent enough, but their parents cannot spare their help or what they would earn while they were away.

9271. Do you think if it were possible to give more that the Board of Agriculture would be justified in giving more towards assisting small farmers to obtain additional education in agriculture?—I think it would be a very good thing for the future of farming in this country.

9272. You attach real importance to it from the point of view of the future of English farming?—I do. So many small farmers, if they are good men, gradually increase their holdings and become larger farmers by and by, and it would fit them for a larger scope when they are able to take advantage of it, and I think the future of our farming depends a good deal upon that.

Mr. W.
McCracken.
19 June, 1907

Mr. W.
McCracken.
19 June, 1907

9273. Would you say it was rather education than want of land which at present prevents the development of small farms in England?—I could not answer that question, I do not think, at least not without having thought it over first. I think it would be probably part of both: I do not think it could be ascribed entirely to either one or the other.

9274. Have you come to any conclusion as to the direction in which money is very particularly wanted at present?—I think it is most particularly wanted in the directions I have mentioned before with regard to cheapening the cost for the smaller people who cannot afford to go to college otherwise.

9275. (*By Mr. Lamont.*) Do I understand that you consider that the sons of small holders are more alive to the advantages of agricultural education than the sons of the larger farmers in the country?—No. I do not think so. I think the converse really is the case.

9276. The need with them perhaps is greater, although the desire may be less?—I think so, and it would perhaps not be a bad thing to try and instil the desire.

9277. You were speaking about the cost just now, do you not think that the small farmers in this country could afford what is the average cost in Denmark, for instance, where, at the secondary agricultural schools the ordinary fees are about thirty shillings a month, inclusive of board, lodging, and education, and at which cost the education is very largely availed of by the farmers, who, as a rule, are mostly small farmers?—Yes, I think something like that would probably induce a great many more to take advantage of it. I think in most cases some charge like that could be made, although, of course, in some cases it could not.

9278. May I take it you agree with me that for a small holding policy to be a thorough success not only is agricultural education necessary but it is absolutely vital also to instil the principles of co-operation among the small holders?—I do think so.

9279. Would you further agree that something in that direction could be done by means of education in co-operative methods?—I do think so. I do not think small holdings would have a very good chance of success in many parts without something in the form of co-operation being organised.

9280. (*By Mr. Latham.*) I would like to ask you a little more about this judging by weight. Do you know Shrewsbury market at all?—Yes.

9281. You are well aware that all animals there are weighed?—Live weight, yes.

9282. I think you said there was not much to be gained by attending an auction?—Not from an ordinary auction where they do not see the animals killed afterwards.

9283. That is my point, but they could go and see the animals killed if the chance was given to them. I do not see how any possible information could be given to them on that point in the colleges. You would not keep a large lot of beasts for the young men to judge live weights?—No, I did not mean that. What I was referring to was that in connection with our own County Councils there has been a good deal of agitation to have the slaughter-houses of butchers concentrated in central places, where they could be better inspected. If that were carried out, and the killing of animals concentrated in certain places, any pupils in the neighbourhood might have the right given to them of going to those slaughter-houses and judging the animals' live weight, and seeing them killed afterwards and weighed.

9284. Do you think if the farmers in the neighbourhood were to allow pupils to go and see their animals killed it would be useful?—Yes, that might be useful.

9285. They must get the knowledge somewhere?—That is so.

9286. At what age do you recommend these young men to go to the colleges?—I should say about 15 to 16, perhaps.

9287. Do not you think it would be a very great advantage if they got their practical education before they went?—Of course if they are on a farm they practically always do; they get a great deal; at any rate, I think they ought to have enough to enable them to appreciate what they are taught when they go to a college.

9288. To put it in another way, it is much better for them to get the practice before they get the science?—Part of the practice, because the improvement of practice takes one's whole life, does it not?

9289. I quite agree, but do you not think if they took the

scientific part first they might be likely to lose their liking for the practical part afterwards?—That might be so in cases, but if they are farmers by nature I should think the extra teaching they got would only go towards increasing their liking for farming.

9290. I value your evidence to such an extent on this particular point that I should like what you think in this matter to be exactly recorded; that is, if the farmer is to have any real benefit from science, it must be got by adding the science to practice rather than by adding the practice to science?—Yes, I think the most successful teachers in agriculture have all been farmers to start with, and have learnt the practice before they have gone to college—of course, that is as far as the college age admitted.

9291. Now with regard to farmers remaining in the localities in which they have been born, did I understand you to say that you thought it was necessary for them to migrate about to try and get fresh ideas?—No; what I have had to complain of in conjunction with my colleagues at some of the examinations is that the students showed too local a knowledge.

9292. Your idea is that it would be a very great advantage if agriculturists could be placed with some of the principal farmers in other districts for a time, so as to broaden their views?—Yes. I know a good many cases where that is done, where a farmer sends his son to a totally different part of the country—exchanges him, really, for another farmer's son, and they are supposed to help their host in the farm work while they remain with him.

9293. If scholarships could be given to some of these more advanced farmers in the counties, in the way of travelling scholarships, it would be of great advantage to these young men?—Yes.

9294. You think it would be money well spent?—Yes, and even in some exceptional cases, if scholarships were given for them to go abroad.

9295. Supposing the Board of Agriculture recommended scholarships to the several County Councils, what sort of scholarship should you recommend them to offer?—Do you mean travelling scholarships?

9296. No, any sort of scholarship for agricultural education purposes. What should you say would be the best kind of scholarships for the Board of Agriculture to recommend, provided they did recommend it, which I do not think is at all likely, the County Councils to offer. Would you recommend them to offer them to the farmers that we have been speaking of, or to the colleges and other scientific centres?—Scholarships have been only instituted in reference to colleges before, and I have not yet thought of the other idea, but no doubt it might be a very good one.

9297. Perhaps you know as well as I do that farmers are not particularly well off, and a scholarship offered to a local man would be quite as readily taken up as if it were a scholarship offered to a scientific centre?—Yes, but of course that I think would be an entirely new departure, and I cannot say that I have thought of that.

9298. I agree it is a new departure, but we have had it recommended here and I think a great deal of it myself. In the position you hold, you have no doubt a large experience of practical and scientific agriculture, and do you not think it would very much broaden the ideas of young men if they could get sent out to different stations?—I think it would do a great deal of good.

9299. If the Board of Agriculture did think right to commend scholarships it would not be at all wise, perhaps I might say, if these scholarships were confined entirely to science?—No, I think it would be very useful indeed. I think it would be a very good thing also if some sort of register could be kept of farmers to whom the sons of farmers in other parts of the country could go.

9300. You say in the more advanced schools and colleges you do not recommend much manual work. I suppose I may say you think the manual labour or the agricultural education from the practical side should be learnt before they go to these places?—I do, because I think if you mix too much practical work with study at a college they cannot do both well. A student is liable to go to sleep over his books in the evening if he has been working a good deal during the day, and he would not be so able to do the reading work.

9301. With regard to doing actual work with their hands, do not you think it is very advantageous to have a farm attached to the scientific centres?—Yes, I should think it is absolutely necessary.

Mr. W.
McCracken.
19 June, 1907

9302. You say, "By arrangement with Farmers' Associations of Grain Merchants samples with current prices might be regularly supplied and competitions as to values." What do you mean by "competitions"?—What I was rather intending to convey was that students might be supplied with samples and current prices, and, after a certain amount of instruction, might themselves compete in the way of judging the qualities and expressing opinions with regard to the current values.

9303. Would you give a certificate or anything of that sort?—Yes, they might have a certificate for the best number of points over a season, or something of that kind, perhaps. One notices with a good many students that even the commonest kinds of grain and seed that they do not happen to have seen on their own land they are very often ignorant about, and frequently absolutely ignorant as to their value.

9304. From those remarks one would almost infer that the ordinary farmer's son is more illiterate than he used to be?—In regard to knowing market prices?

9305. Yes, it is your experience that farmers' sons are not so well enlightened as they were years ago?—No, I do not think that is so, but formerly only the sons of landowners and the largest farmers—public school boys for the most part—went to colleges, now the majority are drawn from elementary schools. The average standard of education of the few who went to colleges up to fifteen years ago was consequently broader in its nature than that of the many at the present time.

9306. Because it is quite a new departure from anything I have heard of before that farmers' sons should be taught by grain merchants the value of grain and wool and cheese. We have not got to auctions yet for selling grain?—No, but I think students are liable to get out of touch at college with the actual prices, and I think it would be something towards giving them a better idea of the practical business that they will have to take up afterwards.

9307. You do not think having seen his father selling his own grain would be a sufficient education to the young man?—There is no reason why he should not get more. I think the more experience he gets the better, because it would all come easily in the curriculum; it would work in without taking up any extra time.

9308. I am not quite sure where you would have to go if you began teaching all the values and prices of grain and wool and cheese, &c., in the College. How would you be able to teach the value of wool in a college?—I do not think that would be very difficult if they had been in the habit of having samples to go by and of following the market prices.

9309. I take it you would have samples sent in from the different wool sales of all the different classes of wool, and let the students value them?—Yes, with numbers perhaps attached to them together with a schedule of prices. I think it would be very useful in making them take an interest and keep up their interest in that branch of their business, and in what is going on in the markets while they are at college.

9310. That would apply to cheese and butter and different things?—Yes, as far as practicable.

9311. You suggest a very great deal as to students learning about the current values of live stock and judging as to live and dead weights, and that sort of thing. Have you ever thought anything about price values?—In connection with live stock?

9312. Yes.—It would be with a view to that, of course.

9313. Would you take them to the market and let them value the thing prior to its going to auction—value them for themselves first and then see what they fetch afterwards?—Yes.

9314. Have you done any of that?—Yes.

9315. Do you find they get pretty close to the prices?—Yes, but, as you know, auction prices vary enormously in relation to values.

9316. (By Mr. Medd.) With regard to the children who would attend the schools of which you spoke, do not you think the age of 15 or 16 is rather high? Would they not most probably have forgotten all they had learnt at the elementary school by that time?—I should hope not.

9317. One's experience is, I am afraid, that when they arrive at the age of 15 or 16, their reading, their compositions and their arithmetic are extremely defective, so defective indeed that for teaching purposes you have to begin again practically. Is not that your experience?—I was not

referring so much to the labourers as to the farmers' sons for the colleges.

9318. I was referring to where you say "Farm labourers and small holders obtain less benefit from College than from itinerant lectures." Then you go on to say that practical schools would be an advantage for small farmers' and labourers' sons?—Yes.

9319. At what age do you think they ought to go to these practical schools?—I should think in that case immediately after they leave the elementary school.

9320. Exactly; at the age of 13, that is what I wanted to say. Have you seen one of these schools in France, the *école pratique d'agriculture*?—No.

9321. Or have you seen the *école primaire supérieure*?—No, I have not.

9322. From what you have read about them would you agree that a school of that type, the *école primaire supérieure* with the agricultural side, or the *école pratique d'agriculture* is the type you want for the small farmer's son and the labourer?—I am not sufficiently acquainted with the working of those particular schools to give you an opinion.

9323. Do you know any of the Dutch schools?—No, I know Swedish schools more particularly.

9324. I do not know them myself. What is the age at which they go there?—I think they are older, if I remember. It is some years now since I was there.

9325. We have to deal in England with a population who are very averse to going to school at all except under compulsion so that in dealing with these labourers and small farmers' sons we must take them at the earliest possible age if we are to get them at all?—Yes, I do not think you would get the labourers' sons later.

9326. No, they must be got the moment they leave school?—Yes.

9327. So that a school of this type is what you would advocate where a great deal is given to practice, and only sufficient science to enable a man to understand the causes of the commoner farm operations?—That is exactly what I mean.

9328. That is the type of school that the *école pratique d'agriculture* represents. Reference was made here, I think, by Lord Barnard, to the great expense of establishing such schools in each county. Probably you would agree with me that it would not be necessary for each county to provide a school of that grade, two or three counties might combine and provide one?—Yes, and I do not know whether it would not be possible for these boys to do a certain amount of work on the farms in the neighbourhood.

9329. That has never been found to answer, but you would agree the *école primaire supérieure* is the type of school which could be provided in any central village to which the children could be conveyed by cart or to which they could walk. Have you considered that type of school—a higher elementary school?—Something of that kind, I think, and the nearer it could be brought to their own doors the more you would get to come.

9330. With regard to bursaries, there seems to be a sort of confusion. Were you not referring to bursaries which might be awarded by the State to the children of deserving parents, bursaries, I may say, of three kinds, bursaries merely to cover the cost of maintenance, that is where the child had to sleep away from home, and bursaries in exceptional cases to provide the instruction and also to compensate the parent for the loss of the child's wages?—Yes, something of that kind. I suppose that could only be done by the local authority by arrangement.

9331. As we know they are done in France by the Government, the local authority administering and giving the advice as to the recipient?—Yes.

9332. That is the sort of thing you had in mind, I think?—Something of that kind.

9333. In regard to Cheshire, is any exceptional education given on the Peckforton Estate?—Not that I know of.

9334. Do you know whether they have any system of co-operation there?—I do not think so.

9335. Yesterday we had the Vice-Chancellor of Manchester University speaking in reference to the possibility or the probability of developing an agricultural department there somewhat similar to the existing department at Cambridge. I think you are an Alderman of the Cheshire County Council, are you not?—Yes.

9336. It would be extremely desirable that Cheshire should be a county affiliated to such a collegiate centre as

**Mr. W.
McCracken.**
19 June, 1907

might in that manner be developed at Manchester, Manchester being for practical purposes only for agricultural research. Perhaps you are not, at a moment's notice, prepared to say how far you would recommend it in Cheshire?—One would have to see the scheme first and know all about it.

9337. You quite see the desirability of affiliating counties to collegiate centres if we are to have any systematic provision of agricultural education in the country?—Yes, we have that in certain directions in the county, but not connected with agricultural education.

9338. Yes, I know you have, but you are not connected in agriculture because Manchester has nothing to offer you in the way of agriculture?—That is so.

9339. Do you not think that Cirencester is well qualified to become a collegiate centre for Gloucestershire and a group of different counties near?—Yes, I should think so.

9340. It would be extending its great past usefully by occupying such a position in the future?—Yes, of course there would be some difficulty with regard to the details.

9341. The details would be a matter for consideration, of course?—Yes.

9342. (*By Lord Barnard.*) I have been informed by Mr. Brooke-Hunt on one question I put to you that as a matter of fact the Essex County Council did give a travelling scholarship to one of their teachers. He travelled about a good deal, and it was of the utmost benefit to him, and he now holds a post as lecturer to the County Council, so that the suggestion has been tried and it has been found successful?—I did not know that.

9343. You are familiar, of course, with the system by which estate agents to private landowners take pupils?—Yes.

9344. Do you think that it is a satisfactory system? Do you think that these young men learn much?—I am rather interested in that because I have some myself and therefore I do not know that my answer would

be quite unbiassed. In my opinion pupilage with a land-agent should always be supplemented by a full college course of study.

9345. I dare say you are acquainted with a good many members of your own profession?—I am.

9346. Do many of them begin as pupils?—I think the majority of them.

9347. Taking land agents as a whole (I suppose I need hardly ask you) do you consider they are fairly well equipped to perform their duties?—I think so.

9348. Many of them farm themselves?—Yes. The majority of large estates have land in hand and a home farm.

9349. Therefore they have very good opportunities of putting their practical knowledge into operation?—They have.

9350. With regard to the system of a farmer in one part of the country sending his son to a farmer in another part of the country and receiving that farmer's son in exchange, we have been informed that that system is already in operation?—Yes, I have known a number of cases. I know one case where a Lothian farmer sent his son to Northumberland for a year, and the Northumberland farmer sent his son to the Lothians in exchange. They do as much work as they can, and the system is a success.

9351. It need not be an exchange, need it?—Not necessarily.

9352. Supposing the County Council were agreeable to pay for it, and you had a suitable instructor and a pupil who would benefit by the instruction, because, of course, it would be a waste of money to give scholarships to those who did not intend to profit by them—do you think that such a system would be advisable?—I think it would be advisable in addition to his college training.

9353. Do not you think it would be advisable without college training?—Yes, but I think college training is necessary to every farmer who is going to farm on a large scale.

Mr. CHARLES H. EADY, called and examined.

**Mr. C. H.
Eady.**

9354. (*By Lord Barnard.*) Would you just tell the Committee what your present position is?—I am farm steward and assistant agent to Lady Wantage, at Lockinge.

9355. How long have you held that position?—About 30 years.

9356. Then your experience, we need not say, is very large?—Yes, in that part of the country.

9357. I do not know whether you know the object we have in sitting here. The President of the Board of Agriculture has requested us to inquire as to the provision which is now made for affording scientific and technical instruction in agriculture in the country, and to report whether, in view of the practical results which have been obtained, the existing facilities for the purpose are satisfactory and sufficient, and if not, how they could be modified or extended. Have you any view that you would like to give the Committee on the facilities which at present exist for giving scientific and technical instruction in agriculture?—I think all those places should be associated with a farm. I do not think they can learn farming out of a book, and I believe most of the colleges have a farm attached now.

9358. Of course you are aware that many of the county councils have done a great deal of other work in instituting lectures, not only on farming, but particularly on dairy work and on bee keeping and poultry keeping, and so on?—Yes. I should say that the lectures on the dairy work have been very successful. I think the quality of the butter has been greatly improved where the lectures have been given. I know they visited Lockinge, where several farmers' wives and daughters attended the classes, and very good results were the consequence.

9359. I wonder whether you could give us your opinion as to whether butter makers have been able to reap greater pecuniary advantage in consequence of these lectures. Do you think they get higher prices for their butter?—I am not able to say that. I should hardly think they do. I think it is perhaps more in the matter of home consumption

that the farmers' wives benefit—in the butter they consume at home. I do not think there is much marketing of butter done, or that there is much pecuniary benefit from selling the butter.

9360. Do you think there is much advantage in farmers having a knowledge of chemistry, especially with regard to artificial manures and so on?—I think it is of advantage, but I think it is a thing that you can get all the knowledge you want by sending to a professor. I do not think it is worth while for a farmer to send his son to college in order to get knowledge that he can get much better from a professor for half-a-guinea, just as when you are ill you send for the doctor.

9361. That knowledge must be got from somewhere. The doctor must be trained somewhere?—Certainly.

9362. I suppose you would agree that it is desirable the professor should have a practical knowledge of farming also; not merely a laboratory education?—Yes; I think the two ought to go hand in hand.

9363. I do not know whether you know that a very large number of these teachers and professors of agriculture have come from off farms?—No, I do not know that. I know of one teacher who was a farmer somewhere in Oxfordshire at one time, but I do not know whether he was successful as a farmer.

9364. They have not all been farmers, I suppose, but they have come from farming stock as a rule. You do, I suppose, know of cases in which farmers have consulted agricultural chemists and scientific men?—Yes.

9365. Do you think that has been of value to them?—Certainly. I have questioned them myself about different things, and I think the present Professor of Agriculture at Reading has taught me a thing or two, but more particularly as regards fruit trees. I am sure he taught my working gardener more in a few minutes about how to prune fruit trees than he ever knew before—more, perhaps, than he would ever have been able to teach me about farming.

Mr. C. H.
Eady.
19 June, 1907

9366. Your opinion is that a trained teacher can teach in a very short time what it would take a very long time to acquire by experience?—That is so.

9367. You think that is an advantage to aim at?—Yes; but I think the practical teaching would be more lasting.

9368. You know twice as well as I do, I suppose, farming in this country is not very profitable?—Well, it would be profitable, I think, if the land was let at a cheaper rent. The great fault in farming now is that the land is let too dear. It ought to be let at the same price, according to the price of produce as it was 40 years ago, and then farming would be as successful now as it was 40 years ago.

9369. What is your opinion as to the provision which is now made for the education of agricultural labourers in some counties? I dare say you are aware that classes are provided for giving manual instruction in various counties. What county are you yourself concerned with?—Berkshire.

9370. Is there anything in the way of classes for hedging and ditching?—No; nothing of the sort.

9371. How do you think the labourer should be taught his work?—You want a good practical man. You want a good hedge-cutter to take a young man to go with him and the same with a thatcher. Let him first of all serve the thatcher, as we call it.

9372. Do not you find that those good practical men are decreasing and that something must be done to keep up the supply by teaching the young ones?—That is so, and we try to do it by sending the young men with the old ones to get that instruction.

9373. Do you give prizes to them at all?—Only to shepherds for rearing lambs.

9374. Do you know anything of field experiments and demonstration plots?—We have tried a few experiments for the college at Reading.

9375. Have you found that an advantage. It probably would not be more of an advantage to the college than to yourself?—Yes; we did it for the college so that they could bring the students over and see what we had done.

9376. You in common with other agriculturists get the benefit if there is any benefit?—Yes. We get a little benefit from the way they manured the grassland. We had some plots on the downs and we gained the same experience as the professors and students.

9377. I think they issue leaflets and bulletins from the college?—Yes.

9378. Do you read them?—Yes.

9379. Do you find them of advantage to you?—We do.

9380. Have you any woods in Berkshire of any extent?—We have some woods on the Downs but they are not very extensive.

9381. (*By Lord Moreton.*) Many witnesses have given us a good deal of evidence about the advantages that the country at large derives from the system the Board of Agriculture have of local Correspondents. Have you ever found much advantage from that system?—Not at present.

9382. Do you know who they are in your district?—I do not—Mr. Adams, I believe, is one, but Mr. Latham could tell you better about that.

9383. If you yourself do not know I can hardly assume that the ordinary small farmer in your district is likely to know more than you do, or to get very much advantage from them?—No.

9384. (*By Dr. Somerville.*) You say you are supplied with leaflets and reports from the college at Reading?—Yes.

9385. Do you know that the Board of Agriculture issue a large number of leaflets intended to benefit practical farmers?—I understand they do.

9386. Have you come across those leaflets at all?—No. I only get the market reports every Sunday morning, for which I pay 6s. 6d. per annum—and a very good thing it is and very well written, and very correct reports I think they are.

9387. You are quite satisfied that you get benefit from that report?—I am.

9388. We have had that report brought before this Committee, and it has been stated that the figures published in it are not given in a form in which they are of service to agriculturists, more particularly, for example, I remember it was said that a market will be reported upon as having shorthorn store cattle sold at 37s. to 42s. per live cwt., and it was said that such a quotation as that did

not help farmers at all?—I think it would. I do not see why it should not, at all. You know how many cwt. a bullock ought to weigh, and you would be able to tell what those were worth by what they were fetching.

9389. It was contended that the limits of the figures, 37s. to 42s., were too wide?—It depends upon the quality of the bullock, of course.

9390. And the age also—the younger the age at which they sell a bullock, the higher the price per cwt.?—Yes. If they put the price 37s. to 42s. per cwt. it would be quite as good as putting “£14 to £20,” or anything of that sort. Unless you were to see the animal you could not tell nearer.

9391. I have been following these reports for the last few weeks, with a view to ascertaining how much I should ask for my wool, and I have failed to find any market reports for that. Have you found any difficulty in that respect. There has been no end of wool sold during the last two or three weeks, and this is just at a time when farmers most want that particular information?—The market has just commenced, you see, so that there could not be any knowledge to put in print yet.

9392. I think they have been going on long enough for quotations to appear. Lord Barnard was going to ask you about forestry, but I think you said forestry with you was not a matter of very great importance? Not with us.

9393. I think you have some hundreds or thousands of acres of woods?—Hundreds, not thousands; but it is coppice more than wood. We utilise the underwood for making hurdles for our sheep.

9394. Do not you sell any of it?—No.

9395. Are you able to supply all your own requirements?—No, we buy a good deal.

9396. Do you pay as much for it now as ever you did?—I believe so.

9397. You would say, therefore, that those who have underwood to sell are able to command as good a price as they did 15 or 20 years ago?—I should think so.

9398. Your experience is quite different from the experience of many other people in England?—Possibly.

9399. Your condition of affairs being so satisfactory, I do not know that I need ask you any more. What is your position? Are you general manager of Lady Wantage's estate?—Only of the farms in hand.

9400. Including the woods?—I have nothing to do with the woods. We have got a forester with the men under him. The only thing I have got to do with them is to cut the hurdle-wood for our own use.

9401. The system of forestry there, namely, cutting over a crop of underwood every 12 or 15 years is so simple that I suppose you do not find any necessity for technical education of that sort?—We do not.

9402. (*By Mr. Latham.*) Your education as a farmer's son, which I believe you are, has been of a very varied character?—I do not know that it has been of a varied character; it started from the cradle. I do not know that it has varied very much.

9403. You have been educated in the ordinary way and the whole of your education as a farmer started with your father and you have added to it upwards?—Yes.

9404. You have had an enormous practical experience?—That is so.

9405. Do you consider the education of the ordinary practical farmer can be improved?—I think it can be greatly helped.

9406. Tell us how?—I think it would be a very good plan for any farmer to send his son to college for about a year; but I do not think he can learn farming at a college; you cannot learn farming out of a book, any more than you can learn to ride out of a book; but I think it would be a great help to him to go for a twelve month.

9407. You think the type of knowledge they would get at these scientific colleges would be an advantage to farmers' sons?—Yes, for a twelve month, but not to keep him there and think you were going to make a farmer of him in two or three years. That, in my opinion, would be impossible.

9408. Your general knowledge of life has been very varied and very successful, but if you had had a little science as well, possibly you might have been better off even than you are?—I might have been, but I do not know where it would have come in. I might have learnt a little about artificial manures, but I can get that at

Mr. C. H.
Eady.
19 June, 1907

present at any time by paying 10s. 6d. to have the manure analysed.

9409. Do not you think that learning the composition of soils is of use to you?—I think it would be a waste of time for a farmer. I think he would soon get to know all about that himself if he were on a farm for a little while. He would soon know the needs of the soil and what it wanted and what it could do if he was at all observant.

9410. Do you think they can teach a man to value stock at any of the scientific centres?—No, certainly not.

9411. Or the weight of stock as it comes to market?—Certainly not.

9412. Do you think it an advantage to have these sort of guessing competitions in show yards?—They might be a little amusement to them. I think if you have a college farm you want all the different breeds of cattle to teach these young men the difference between a Shorthorn and a Devon, and a Sussex and a Hereford, and to know what they are best adapted for. Some breeds are adapted for one thing and some for another; and you want to know also what your land is adapted for, and then pursue that to the best of your ability. Practice is the only thing that will teach that.

9413. Those sort of things cannot possibly be taught at a college?—In my opinion they cannot.

9414. You spoke just now of dairy instruction and said you thought it had been of very great advantage to the county?—Yes, I think so where they visited. I think they taught the farmers' wives and farmers' daughters the proper temperature at which to scald their churns, and little things like that.

9415. That was not restricted to farmers' daughters?—No, unfortunately it was not. People went out of curiosity—doctors' daughters, and lawyers' daughters—and never troubled about it afterwards, and they occupied places that ought to have been occupied by farmers' daughters.

9416. With regard to the farriery schools, has there been any great advantage to the county at large from those?—There has been no advantage that I know of. All I know is we sent our best man to compete for a prize, which he won, and the instructor in farriery offered him more money to go and teach others, and we had to find somebody else.

9417. I have always heard it spoken of as a great advantage to the county that you have been able to teach such a good man?—That might be, but he left us, and we had to teach another.

9418. That brings me to another part of my question, that is, your actual practical life has been of very great service to you and others?—Certainly it has.

9419. I do not think that we should decide from your evidence that science is no part of your curriculum?—No, I do not wish you to think so, I think that practice and science is a very good thing, but you must have a greater proportion of practice.

9420. Speaking of land agents, do not you think they are very much improved in their work by a little science?—No doubt of it.

9421. They are of much more value to the community at large by having had a certain amount of scientific education?—Yes, and it would be a good job if they had more of it, but they are very often made from the wrong people.

9422. Have you seen any serious things happen in consequence of a farmer being scientific?—No. We have got none of that sort; we have got some very bad farmers, but they are not very scientific.

9423. Have not you known men who have taken up too scientific a line in agriculture, and have possibly suffered?—I think if they did they would soon fail.

9424. With regard to the rent question that you referred to; if a man is going to take a farm, would it not be better that he should have some instruction either from his father or from some scientific centre as to the value of land, and whether land is likely to be of a certain value to him or not?—Of course it would, but his father would be the best authority to teach him that, not a college.

9425. But fathers are not always the best authorities?—They ought to be educated with practical knowledge.

9426. Unfortunately "ought" does not stand for much. If a father has been successful, is there any reason why his son should not try and be still more successful?—Certainly not, but it is not from want of scientific knowledge, it is often from want of capital and want of energy that they are not successful.

9427. All men have not suffered from want of capital?—That is so.

9428. I think I could show you many men who have suffered from want of practical knowledge as well as from want of scientific knowledge?—Yes.

9429. You have had some experience of agricultural lectures. Have you been to any when they have not been very successful?—I have. We had one professor come to our place some years ago, and he had a meeting in the village, and he told the men who kept pigs that the manure from them was of no value; he would give them a recipe by which they would be able to put their fingers into their waistcoat pocket and take out sufficient manure to put on their allotments, and somebody called out "yes, and you would be able to put your fingers in the other pocket and take out the produce."

9430. He was rather made fun of?—Yes, and when the lecture was over we asked him two or three questions which he could not answer at all.

9431. Lately you have been hearing Mr. Percival lecturing at Reading, I think?—No, I have not heard any of his lectures.

9432. You know that they were very much appreciated, I think?—They were. He lectured on malting barley and that kind of thing, but I did not happen to be present.

9433. You do not complain of lectures being given at different places, your complaint is against the lecturers?—Yes.

9434. If you get a good sound straightforward man who knows what he is talking about, farmers would come and listen to him?—They would.

9435. And benefit by him?—No doubt; you can always learn something if you keep your ears and eyes open.

9436. There is no feeling against the system of giving lectures, the only thing is that, unfortunately, particularly in our county, we started with poor lecturers?—Yes.

9437. Going back to these market reports, which I think a very great deal of, you say you receive them every Sunday morning, and you find them very useful?—Yes. I appreciate them very much, I think they are very well written and they give a very correct account of the stock, and whenever I attend a market I look to see afterwards whether the reports are right when I get back, and I find they are.

9438. Your experience of markets is large?—Yes.

9439. A good deal of stock has passed through your hands?—Yes.

9440. Do you think it would be more valuable if the reports appeared more than once a week?—I do, because there is a long time to wait for some of the reports, and if they appeared twice a week instead of once you would get quicker reports of some of the markets, because one market may be held on a Monday, and you, therefore, would not get those reports until the following Sunday, and if they were published twice a week you would get the information in the middle of the week and it would be a benefit if you could get your information sooner.

9441. That would be more expensive, of course?—Well, we pay 6s. 6d. a year now; I do not think it would cost very much more.

9442. I do not think you use a great deal of artificial manure. Do you take advantage of the Fertilisers Act?—We have done.

9443. Have you found it any good to you?—We have. We have found the manures to be what they were thought to be. I think the Fertilisers Act has frightened the manufacturers, it has done them good.

9444. Science helps us in that way, does it not?—Yes, but you have no business to use artificial manure. If you want to make farming pay, you want to have always something to sell, and never to have to buy anything. If you do the sheep well, and use your own hay and straw, and just a little artificial manure to help the roots, the swedes and the turnips to grow away from the turnip fly, you ought not to want anything else; there is a great deal of money squandered away in artificial manures. A farm ought to be like a leg of mutton, and produce its own basting.

9445. By selling your hay and straw and bringing back artificial manures, you might have more money to put into your pocket, might not you?—I do not think so at the present price, hay 60s. a ton, straw 24s. a ton.

9446. It has not always been so cheap as that?—No, but it is not very dear and it never will be again.

Mr. C. H.
Eady.

19 June, 1907

9447. (*By Mr. Medd.*) Can you tell me what the quality of the labour in your district is?—Very good and very cheap.

9448. You have no cause to import labour?—Not at all. We have an abundance of labour.

9449. To what do you attribute its good quality; I mean in regard to the more skilled branches of farm work, hedging, thatching, rick building, draining, and so on?—We have men who can do all that, and do it well.

9450. They learn it from father to son, I suppose, in your district?—Yes.

9451. In other parts of Berkshire that is not the case?—It is with us. We have plenty of labour, and good labour.

9452. Do you know any other part of Berkshire where the conditions are different?—I do not.

9453. (*By Lord Barnard.*) They are probably all estate labourers that you get, who learn from father to son?—No, I have nothing to do with them; the estate labourers are nothing to do with me at all.

9454. (*By Mr. Medd.*) Probably your wages are higher, is not that the real reason—you probably pay higher than the local rate?—No, we avoid that because it offended the farmers. They were doing that at first when I went to Lockinge, but it upset the farmers very much, and I put a stop to it.

9455. In answer to Lord Barnard you spoke about instruction in hedging being of value for the labourers?—Yes, we let the young men learn from the old ones.

9456. Take the case of these more or less skilled operations that I have mentioned, hedging, rick building, thatching and draining, do you allow the lads on your land to learn from the older men?—Yes, and very often they are their own sons that they teach.

9457. Of course, you have no necessity to apply to the other farmers for permission to use their hedges and land for that purpose?—No, we have plenty.

9458. You cannot say that your experience applies to the rest of Berkshire?—No.

9459. (*By Mr. Latham.*) Farmers ought to teach their men themselves?—Of course, they ought.

9460. The great secret at the present time is that they do not know how to do it?—It would not do for me to say that, but, I think, it is the fact that they do not know how to do it themselves. If they had been brought up as they ought to have been brought up they would know how to do it.

9461. In the old days they did know how to do it?—Yes. There was a period when farmers were very successful, and at that time their sons went in for fishing and shooting and cricket rather than farming, and now that period has gone by, and things have altered, the farmers have come back to teaching their sons again.

9462. The great secret of why your men are so satisfied is the excellent cottages provided for them on the estate?—No. As I say, we do not get the men from the estate, many of the cottages are occupied by estate labourers, such as carpenters, blacksmiths, &c. We get all our men from the villages and the different places round. We have a few cottages belonging to the farms for carters and shepherds.

9463. Still, after all, the privileges that your people have are such that most farmers cannot offer?—I do not know where the privileges come in. We are master over them and they have got to do their work. I do not let any of the men be master over me. I am master, and they

know it; but I treat them well and they do their work well. We have over 400 on the farm.

9464. Driving through Lockinge, as I have done frequently, I might term it a pattern village?—It is a very nice village, but the cottages that you see with nice gardens are occupied by men working in the gardens.

9465. It is a great advantage to work for Lady Wantage, and you seldom lose a man who once goes to work for her?—I do not know that that is so at all.

9466. Have you many changes?—Well, we keep the good men and sack the bad ones.

9467. Most of them have been with you many years?—Not most of them; a few of them have. As the young men grow up they want to go as soldiers and policemen. We have a difficulty in keeping the young men. We keep them as long as we can, but a great many of them leave us.

9468. But you have a number of young men working for you?—Yes, we have a good many young men. A lot of them go into the army and the militia, and come back again in three years perhaps.

9469. (*By Dr. Somerville.*) I was very much interested in what you said, that a farm ought to be like a leg of mutton and supply its own basting?—Yes.

9470. But I think you qualified that by saying that you "did" the sheep well?—We do all the stock well, sheep have plenty of roots with some corn this: enables one to grow good crops.

9471. You do not buy much cake?—No, very little.

9472. You think a farm should be self-maintaining except for the purchase of a little artificial manure to start the roots?—Yes; I think the great thing in growing good crops is cultivation more than anything else. They go to plough sometimes when the men ought to be in bed and the horses as well; there is as much in cultivation as there is in manures in growing good crops.

9473. You admit there are some farmers in your district who are bad farmers?—There are a good many.

9474. You also said that these farmers were not troubled with much science?—No, not much of anything.

9475. In other words, we may say that bad farming is associated with ignorance of scientific knowledge?—It is, but still more of practical knowledge.

9476. (*By Mr. Latham.*) Will you tell us a little about your book-keeping?—What do you want to know?

9477. First of all, you issue a balance-sheet every year?—We do.

9478. Will you tell the Committee how far you go into book-keeping?—We keep a debtor and creditor account. We have no scientific book-keeping. My books are kept at the office, and I have very little to do with keeping them.

9479. The farm books are all kept there?—They are kept at the office.

9480. The material is all supplied by you?—Yes; what I buy and what I sell, but they keep the books for me at the office.

9481. (*By Lord Barnard.*) The form in which the books are kept is not arranged by you?—No; we have one of the Brampton Farm Account books which were brought out by Mr. Beasley, and we keep those, and the clerk sees that the books tally with the farm in every way.

9482. All you do is to keep a payments and receipts account?—Yes. We pay everything by cheque.

9483. You hand the information into the office and the books are made up there?—Yes.

9484. Are they properly audited?—Yes; they come up to London once a year to be audited.

Professor T. W. CAVE, F.R.C.V.S., called and examined.

9485. (*By Lord Barnard.*) You are a Fellow of the Royal College of Veterinary Surgeons?—I am.

9486. You at present hold the appointment of Professor of Veterinary Science at the South Eastern Agricultural College at Wye?—That is so.

9487. Do you engage in private practice, or are your services entirely given to the College?—I am entirely engaged by the College.

9488. How long have you been at work with the College?

—Five and a half years, and I had been a teacher for ten years before that. I was engaged in private practice as well until I went to Wye. I combined the two.

9489. You have had at any rate 15 years' experience in teaching?—Yes.

9490. Will you be good enough to state, as shortly as you can, your views on the subject of teaching lads veterinary science in such a college as Wye?—I most certainly think it is of great use. The plan on which veterinary science is taught at Wye is for the first year to take elementary

Professor
T. W. Cave.

Professor
T. W. Cave.
19 June, 1907

anatomy and physiology, dealing of course with the structure of all the animals at the farm and the functions of the various organs. That occupies 12 months. From that we go on to the common ailments of farm stock, teaching the causes and prevention and symptoms, and a very little first-aid treatment. Then in the third year I deal with diseases coming under the Contagious Diseases (Animals) Act, and the regulations which should be observed. That is briefly the scheme which is adopted at Wye.

9491. You do not attempt, I gather from what you have told us, to make a student a veterinary surgeon in any sense of the word?—Most certainly not.

9492. All you attempt to teach him is a sufficient elementary knowledge of the subject to enable him to benefit by veterinary science if it should be necessary?—Quite so.

9493. Do all the students who come to the College go through your hands?—Almost all. Of course there are occasional students who come for special subjects, but all the Degree and Diploma students have to take the course.

9494. What examinations do the students go in for?—The B.Sc. degree of the University of London, and they also go in for the College Diploma and the National Diploma.

9495. Is there an examination at your College?—Yes, each year.

9496. Do you set the papers?—For the Diploma at the end of the course, the first year, second year, and third year we have an outside examiner who examines in my subject.

9497. Do these lads show any appreciable result of your teaching. Do you think that they acquire the knowledge you are anxious to impart to them?—I think so, most certainly. They are very keen on the subject, and I think I may say it is one of the most popular subjects taught at Wye.

9498. Do you think it advantageous, having regard to the very stringent regulations which exist at the present day on the subject of the diseases of animals, that every practical farmer should have an elementary knowledge of veterinary science?—I think that is absolutely essential, especially in regard to the recognition of disease and the causes and the prevention of it. Treatment I barely touch upon, because I have to be most particular, of course, not to go beyond what I may term "professional etiquette"; I do not wish to damage any of my fellow-practitioners in the district.

9499. I think that is the view of most teachers in your position?—We have to take that view; we are compelled to do so.

9500. In spite of that you still believe there is considerable value in the teaching you give?—I am most certain of it.

9501. In addition to your work in the College you give lectures in the county outside?—Yes.

9502. That is to actual practising farmers?—To actual farmers.

9503. Are they appreciated?—I think I may say in the 15 years I have lectured to something like 30,000 farmers, they average 2,000 each winter session, and that has been in five different counties—Nottinghamshire, Leicestershire, the Lindsey division of Lincolnshire, and Kent and Surrey.

9504. Do you find that farmers ask questions at the close of your lectures?—Yes, they are very fond of coming and asking questions privately; they are very diffident about coming forward and asking questions publicly so that the others may benefit. I may say with regard to lectures in the counties that the success of lectures very greatly depends upon the local secretary; I mean in getting hold of the right people. I do not wish to say anything about the clergy, but if we have a parson as a local secretary then it is possible we get a failure.

9505. (By Lord Moreton.) I think it will add to your evidence if you will tell us the titles of a few of the lectures you have given?—I have brought copies of the syllabus with me. (Handing same.)

9506. I see here common ailments of horses?—Those are for the town lectures.

9507. And common ailments of farm stock?—Yes, for village lectures.

9508. You give a series of lectures at different centres?—Yes.

9509. I see altogether there are six lectures?—Yes, the course generally extends over two years, three lectures in one winter at a centre, and I usually follow on the next winter with the remaining three.

9510. (By Dr. Somerville.) What amount of time do you give to the teaching of agricultural students at Wye during their first, second, and third years respectively?—The first year students have three hours a week, that is 33 hours for the term. The second year students have two hours a week, and the third year will have one hour a week in each term.

9511. Do they do any practical laboratory work?—As far as it is possible in the case of illness on the farm; they are always invited to see anything that is going on, but of course the supply is limited in that respect.

9512. Does the College kill its own meat so to speak; does the farm supply the College with its meat?—To a certain extent. The fat stock is frequently supplied to the local butcher and comes back in that way to the kitchen.

9513. Animals are not slaughtered at the farm?—No.

9514. Do you try to make a point of seeing that all agricultural students do actually have the opportunity of handling the digestive organs, we will say, of the important farm animals during their college course?—Certainly, I have frequent demonstrations.

9515. It is not a case altogether of lectures, books and diagrams?—No, of course we have no dissecting room or post-mortem room, but as far as it is possible to do it under the circumstances I have frequent illustrations on the smaller animals, in particular, sheep, for example.

9516. Do you carry out any experimental research work for the benefit of the farmers in the counties?—Yes, that is one of the chief parts of my work at Wye—research work.

9517. How is that prosecuted may I ask? Do you wait until the farmers come to the college and represent that they are in trouble over some mysterious disease?—I am in constant correspondence with farmers in different parts of the two counties. Of course it has been a thing that has been gradually growing up. I was the first to hold the appointment at Wye permanently, and in the five or six years that I have been at Wye it has been gradually extending, and I think now I may say I am pretty well known to the farmers in the district, and they are constantly applying for information, and when it is a disease about which very little is known I attempt to find out the cause of it.

9518. You do not find that this work of yours interferes in any way with the work of the ordinary veterinary practitioner, I mean the taking up of particular diseases and supplying information to farmers?—I always avoid giving farmers information on the actual treatment. I am quite willing to work out the causes and the preventive measures quite freely, but so far as actual treatment goes, beyond the actual first-aid treatment I do not go.

9519. I was rather referring to diseases that you say might require experimental research. You have, in fact, amongst the sheep of Romney Marsh, a very mysterious disease that goes by various names?—Commonly known as "Struck."

9520. Yes, that is a disease that might be taken in hand by the College, is it not?—Yes, that was one of the first diseases I had an opportunity of enquiring into after going to Wye.

9521. Have you completed your researches in that disease?—I have not yet completed the work with regard to preventive measures which may be adopted, the work is still going on.

9522. You are not in a position to tell the Committee what conclusion you have arrived at with regard to that troublesome disease?—I have come to a very definite conclusion as to the nature of the disease, that it is of microbic origin, and if not identical, it is closely allied to the disease of blackquarter in cattle. It is very analogous to it, and I am endeavouring to find some method of preventive treatment which will be successful.

9523. You not only instruct in anatomy and physiology of farm animals, but also in dentition?—Yes.

9524. There would be no objection on the part of a professional man to your giving the students instruction in dentition?—I teach the students dentition and judging ages by the teeth, but at the same time it requires an amount of practical experience to judge by the teeth, and I think, when students have to buy valuable animals, they will still apply to the veterinary surgeon for that part of the work.

9525. In my experience I have found that a qualified veterinary practitioner, a member of the Royal College of Veterinary Surgeons, does find himself a good deal limited

Professor
T. W. Cave.

19 June, 1907

in lecturing to farmers. I think you have already told us that you also find yourself under pretty severe limitations?—I certainly always have felt the limitations, and I have always bound myself most strictly down to what I may term first-aid lectures, which may be compared with the ambulance lectures with regard to the human subject.

9526. By observing those limitations, you have always been able to get on with your professional colleagues in the neighbourhood?—Yes, with very few exceptions. I have had veterinary surgeons coming and taking the chair at my meetings, and I have heard them express the opinion that if the students followed my teaching it would be not only of benefit to farmers, but also to veterinary surgeons.

9527. I should imagine farmers must be rather disappointed when you lead up to the point that you want to take them to and then leave off. Do not you find at times that they are disappointed when you stop just at a point where perhaps they would like you to go on?—No, I have never had a single complaint of that sort. I have always told them there is plenty to learn as to diseases of animals; the causes and means of recognising diseases and first-aid treatment without going on to the general treatment.

9528. It is difficult to know where to stop and where to go on, is it not? Take the case of foot-rot for example. In many parts of the country farmers never think of calling in a veterinary surgeon to advise them with regard to the treatment of their sheep's feet. As a veterinary surgeon, possibly you might not think you were entitled to go as far as to instruct a farmer in the treatment for that disease?—I deal with the subject of foot-rot, to take that disease again, for example, and try to teach as much as possible about the causes and prevention and so on. With regard to the treatment, that is generally in the hands of the shepherd, and I decline to recommend any particular drug. I simply put it in this way, that in pretty nearly every case the drug which is used is a caustic or an antiseptic, and I say, "You can use whichever you like."

9529. You would not go to the length of saying to them, "You may try a five per cent. solution of copper sulphate." You would think that went a little beyond the limits of professional etiquette?—I do not think, taking foot-rot as one of the diseases, that I should be strictly bound in that case. The Veterinary Officers of the Board of Agriculture have published a leaflet on the treatment of foot-rot.

9530. I mentioned that disease because it was a doubtful case?—It is a doubtful case, and it is a disease that is generally treated by the shepherd himself, but if I could advise a better treatment, I do not think I should hesitate to do so, because the veterinary surgeon would not be done an ounce of harm.

9531. The reason being that in most cases of that description, a veterinary surgeon would not be called in unless it happened to be a very valuable animal?—Quite so.

9532. Another case which is also doubtful is milk fever. I suppose you would go as far as giving instruction as to the general treatment of the animal before she calved?—I always begin what I may call the first-aid treatment of milk fever by suggesting that it is an illness in which it is advisable to call in the veterinary surgeon promptly, but in the meantime to take certain steps, the giving of an aperient medicine if it has not been actually given, and so on.

9533. You would go as far as recommending the medicine?—Quite so; that is first-aid treatment.

9534. You could not very well recommend the medicine without recommending the quantity that should be used?—Yes, I should give them the quantity.

9535. You are getting very near to giving them a prescription?—Every farmer knows the property of Epsom Salts as a purgative.

9536. Yes, but I was rather referring to the quantity?—There are very few farmers who do not know the quantity to give. Of course, I should not go into any questions of injection or inflation of the udder, or treatment with oxygen; that would be outside the instruction altogether.

9537. (By Lord Moreton.) With regard to the instruction of the pupils at the College, are the cases of illness among the stock sufficiently large to give you an adequate supply in the way of object lessons?—There are cases of illness, but, of course, we have not an extensive supply.

9538. What I was rather referring to was as to whether you had anything in the nature of a free hospital?—We have not.

9539. I suppose you know that is done at some colleges?—Yes, I believe it is done at Cirencester.

9540. I suppose you would have an objection to instituting a hospital on account of the local prejudice it might be likely to create?—Yes; there would be opposition raised up against the college by the veterinary surgeons if we did such a thing.

9541. (By Mr. Latham.) I know a little about first-aid myself, and I am at a great loss to know how you can possibly take all these subjects that are down on these papers without going beyond first-aid and getting into trouble with the veterinary surgeons?—Well, I can only say I have done it for 15 years.

9542. There is so very little to be said about the dropping after calving unless you say something about the remedy?—There are heaps of facts which every farmer ought to know about the disease quite apart from the actual treatment.

9543. A healthy animal going to bed at night might be quite down in the morning?—I hope you do not want me to give you a lecture.

9544. No, I do not; but I am afraid yours must be a very difficult position?—No, I have not found it so. The farmers, I must say, have always been most appreciative, and where I have had veterinary surgeons present they have supported me in every possible way.

9545. I can understand it in the syllabus of lectures, but when teaching the students you do not expect them all to know about aperient medicines, do you?—I teach the students on that syllabus, but instead of a single lecture, it may take half a dozen weeks.

9546. With regard to telling the age of horses by their teeth, that is a very disputable question?—It depends on the age.

9547. Up to a certain point anyone can tell?—Quite so, but afterwards it is only approximate. One can only give general indications that a horse is 15 years old, so that a student will not be foolish enough to buy him and imagine he is only six.

9548. No farmer who was going to buy an aged horse would take the veterinary surgeon with him to tell him how old the horse was?—I do not suppose he would.

9549. In running over this list of diseases there are some things at the present moment troubling many of us who are a long way from being students, such as glanders, anthrax, and so on. Do you teach on those?—Yes, they come in my third year's course to the students.

9550. Do you include those subjects in the lectures?—No, I have not included those because of the term "common ailments."

9551. I suppose it would not be possible to teach on those because you would be getting into dangerous ground?—I do not think so. With regard to glanders and anthrax, I think they are subjects that could be easily dealt with, but as far as I am concerned, the subjects I have got down on the syllabus are those I have found from experience to be subjects the farmer wants to know something about rather more than glanders and anthrax.

9552. It is only recently we have had the trouble upon us. The detection of glanders and anthrax is almost beyond veterinary surgeons themselves, is it not?—No; I must object to that.

9553. I have known men make great mistakes lately?—In which disease?

9554. Both?—I do not say I would teach a student to make a microscopical examination of the blood and to be able to say what was anthrax.

9555. Then with regard to glanders, it is just the same. It is a very difficult thing for the farmer to detect his animals if they have glanders?—Yes, it is a very difficult thing for a farmer to say that his animals had got glanders, but I should teach him in this way; certain symptoms, discharge from the nostrils, enlargement under the lower jaw, might possibly point to glanders although the same symptoms might be met with in other diseases. It would be a mere warning.

9556. One of the diseases that is troubling us in England very much at the present time is swine fever?—Yes.

9557. I see you have not troubled about that?—No, I have not got that down there. I have only picked out those diseases which, as a practitioner, I have found the farmers are usually most anxious to know about, and, of course, my time is limited with regard to these lectures.

9558. I am not so much talking of the lectures as of the college curriculum?—I use those papers, that I handed to

Professor
T. W. Cave.
19 June, 1907

you, for the college—I use those for the lectures, but that does not cover the whole of the College subjects. In the third year I take the diseases which come under the Contagious Diseases (Animals) Act, which includes glanders, anthrax, rabies, and so on.

9559. (*By Lord Barnard.*) Am I right in thinking that in some cases, at any rate, farmers are very fond of making use of old-fashioned and entirely unscientific remedies?—They are very fond of it.

9560. Is that practice decreasing?—I think it is.

9561. Is one of your objects to put a stop to it and to encourage intelligent treatment?—It is one of my great objects to do away with old-fashioned methods and, as far as possible, to do away with the use of quack remedies.

9562. I do not know anything whatever of veterinary science, but in my farm stock I have, occasionally, suffered from abortion in cows, and my bailiff has a very strange remedy for that—I dare say you know to what I refer?—Yes.

9563. That is a fantastic remedy, is not it, for which there is no scientific basis whatever?—Quite. It is a remedy, however, that is practised by many farmers who have a great faith in it, but I do not think there is any scientific basis whatever for it. That is a subject that I deal very frequently with in lectures, and almost exclusively in one lecture—abortion in cows is a very favourite lecture of mine.

9564. Before adopting any remedy a farmer ought to have some scientific assistance if it is not within his own knowledge?—Certainly.

9565. Do you keep in touch with the Royal Veterinary College in London?—Certainly.

9566. Because I imagine persons in your position would very soon get out of date with what went on if they did not?—Quite so. I may say that there is no body of men more quick to find out whether a man is keeping himself up to date than farmers, and at any meeting of big farmers, a man who was lecturing would very soon be pulled to pieces if he was not quite up to date.

9567. (*By Mr. Lamont.*) I think you said in reply to Dr. Somerville that you would not think it fair to teach farmers in the cases of milk fever the injection or the inflation of the udder?—Quite so.

9568. I was in Denmark last year, and found it was very commonly practised there—almost universally. Do you not think it would be advantageous, without doing any harm to the veterinary surgeons in the country, if our farmers could perform the simple operation required in the treatment of milk fever?—I have formed an opposite opinion to that because the use of the Schmidt treatment in unskilled hands is likely to cause the loss of the udder, and unless sufficient antiseptic treatment is given it is very dangerous; that is why I oppose the adoption of the Schmidt treatment by the farmer himself.

9569. You think before such an operation as that could be safely entrusted to the farmers in this country, that their agricultural and veterinary education will have to be carried a step further?—I certainly think so; they are not ready for that yet.

9570. Your objection in fact is not so much the injury it would do to the veterinary profession, but the injury it would do to the farmer himself, because he has not sufficient skill to carry out such an operation with satisfactory results?—I am opposed to it on both grounds.

9571. (*By Dr. Somerville.*) There is another disease I should like to ask you about as to what attitude you take up with regard to it, that is “gid.” In some parts of the country that I know the farmers, or certain farmers, and in some cases shepherds, are very successful in operating for “gid.” In some cases it has been attended with good results, but in other cases the animal has had to be slaughtered. In no case in certain parts of the country is a veterinary surgeon called in for “gid.” What attitude do you take up with regard to that. Do you instruct your students in any operations with regard to “gid”?—No, I do not. I teach them, of course, about the presence of the *hydatid* and the fact that the operation can be done and is done in certain cases, and I put it very strongly, that it is only in certain cases that a veterinary surgeon could relieve by operation. That it is done in some cases by shepherds is perfectly true in certain parts of the country, but good results would be a very small percentage.

9572. You agree that this disease must either be operated upon by the shepherd or the farmer or simply left alone, because in the case of ordinary stock it would not be able to carry a veterinary's fee?—In the district where I am there have been many of those cases attended by the veterinary surgeon.

9573. That must be in the case of high class or pedigree sheep?—No.

9574. Do you think there is much more room in the branch of agriculture with which you are more particularly connected for experimental work if it were supported by Government?—I think there is more room for it.

9575. You know yourself certain directions in which you could proceed if the staff and material and apparatus were provided?—Undoubtedly.

9576. One particular direction occurs to me, but I may be entirely ignorant, and that is in the direction of plant poisons. Do you often hear farmers complaining that their stock have died of mysterious diseases, and do they bring plants to you and say they are convinced that those plants are responsible for the death, and do you ascertain whether such plants are really poisonous or are not poisonous at all?—The only case of that kind that I have had in the last few years was the death of a number of lambs, and they were found to have died from tetanus. Cases of poisoning are very rare.

9577. That does not prevent farmers from believing that certain weeds that have been eaten by their stock are the cause of death?—It does not.

9578. In some parts of the country farmers believe that a certain weed, the Stinking May weed, which is found growing in pastures is certain death to lambs, and such pastures cannot be let off if that weed is found to be present in them, and any hay with that weed in it cannot be sold. I cannot find out whether Stinking May weed is an animal poison. I have looked in the books, and I cannot get any reliable information, and I ask you as a qualified surgeon whether you can give me any definite information on that point?—I cannot; I know nothing about it.

9579. Do not you think the Government might put enquiries on foot to settle positively and for all time to come whether that belief that is so general is well grounded or otherwise?—Most certainly. I should think that ought to be the work of the agricultural colleges.

9580. There are other weeds of the kind and there is not a book I have come across in which there is any information as to their poisonous qualities. I suppose you could not hazard the opinion whether stock that have died with *Cupressus Macrocarpa* in their stomachs have actually died through eating it, or whether their death has been the result of pure accident or other cause?—I could not express an opinion with regard to that without a thorough investigation.

9581. You think the Government ought to take in hand investigation and enquiry of that description?—Yes.

9582. (*By Lord Barnard.*) Any investigation carried on with the help of Government money I should have thought would more properly be done by the Royal Veterinary College?—Undoubtedly much work could be done in that direction by the Royal Veterinary College.

9583. Supposing the Board of Agriculture wanted information on any such points as these to which Professor Somerville has referred, if the Government were to give the necessary financial assistance do you think the enquiries and investigations could be carried out by the Royal Veterinary College?—Undoubtedly it could be done by the Royal Veterinary College, but it could also be done by the agricultural colleges.

9584. If conducted at the Royal Veterinary College veterinary surgeons, as well as the nation at large, would get the benefit of their investigations?—Yes. What I wished to point out was that many of these diseases are of a local character, and it might be an advantage to carry out certain experiments in those districts where they occur, and that might be done by the nearest agricultural college. I think farmers are more likely to apply to the agricultural college of the district for help in obscure outbreaks of disease than to the veterinary colleges, and I believe much good work could be done in veterinary research laboratories, such as my own at Wye, if sufficient funds were available for carrying on experiments. I have always been severely handicapped in my research for want of adequate funds.

Miss A. MILLER, called and examined.

9585. (*By Lord Barnard.*) You wish to give the Committee some information as to the facilities already afforded at Reading College for instruction in horticulture?—Yes.

9586. I think we have had some information on the point already so perhaps you will take that part briefly. What is the course in agriculture at Reading?—It is a two years' course.

9587. For men and women?—For men and women.

9588. I forget whether they are matriculated students of the College or not?—They are.

9589. All of them?—Yes.

9590. I take it you wish to give evidence particularly as to women?—Yes.

9591. What object have most of the women in view who take up that course?—I should say most of them wish to make their living by growing fruit and vegetables and flowers, and some of them wish to take up teaching afterwards.

9592. Some wish to teach, and some wish to make a living by cultivating gardens, keeping market gardens, and so on?—Yes.

9593. Do you, as a matter of fact, know anything of the after careers of those women?—Of a few of them.

9594. Can you give the Committee any instance of a woman who is now earning her living by market gardening?—Yes, I am earning my living myself by market gardening.

9595. Where is your market garden?—At Farnham. I have been there three years.

9596. Can you tell the Committee generally whether it is financially successful? I presume you had to put some capital into it?—Yes.

9597. Are you getting a sufficient return on your capital compared with what people get in other professions?—No, I should think not. I should think very few people would be willing to go on for the return we are getting, but I do not think that is necessarily because horticulture does not pay; but perhaps because we have not started it quite in the right way.

9598. You think it could be made to pay?—I do.

9599. Do you think the instruction is the cause of the comparative failure?—No, not at all, but in my case I was only able to take one year at Reading, and I think a second year would have been a very great help to me.

9600. You think two years' instruction is of value in enabling a woman to earn her living at horticulture?—Yes.

9601. Can you suggest any way in which that course could be modified or amended?—I should like to see a marketing course in connection with these colleges to be taken afterwards.

9602. That is in commercial methods?—Yes, packing and that sort of thing; preparing vegetables and fruit to be sent to market.

9603. You think more instruction should be given in grading and packing?—Yes, I should like to see a sort of post graduate course in that.

9604. I wonder whether you would agree with me that it is a very desirable way of obtaining information in almost every trade and profession that of getting it by actual practical work. Did you go into business on your own account straight from the College?—Yes.

9605. Do you not think if you had become a sort of working pupil first it would have been a better plan?—Yes, but it is very, very difficult for women to get into ordinary market gardens as working pupils, and I should like to see a department of that kind in connection with these colleges.

9606. I was thinking of my own profession, that of the Bar, where every practising barrister learns his profession by working at it under the eyes of a very skilled expert, and we have been told in this room that the ordinary farmer certainly learns his own profession best by working on a farm, and I should have thought that the best means of learning market gardening would have been to have actually worked in a market garden?—Certainly, but as I say, it is almost impossible for women to get into a market garden as working pupils, or at least it was so when I was learning.

9607. What is your remedy for that difficulty?—I think at a college where they market their produce as they do

at Reading they might draft out some of their students as apprentices. Of course I do not know whether that suggestion would be feasible or not.

9608. How do they conduct their packing there?—They have paid labourers and packers, I believe, who do a great deal of the work.

9609. I understand your suggestion to be that we should try and persuade—if you can persuade us to do so, that is—the Board of Agriculture that it is desirable that more technical knowledge in packing and grading for the smaller produce should be introduced into those colleges?—Yes; I think it would be most useful.

9610. You mention that special help should be given by Reading College both during training and after the completion of the same. What sort of help do you mean—financial help?—No. To take a particular instance, a great deal of help is given by the College in this way. They helped me, for example, to choose a place and I was allowed to consult them about the soil and so on, and as to a good locality to commence in.

9611. What is your complaint in that respect?—It is not a complaint, on the contrary, it is to show that the College has been most useful to me in that way, and to other students.

9612. Does the College give assistance in that way to its former students?—I have never known them refuse it when they have been asked.

9613. They advise students how to start for themselves?—Yes.

9614. Could that be extended in any way?—Of course it might be very difficult. It takes up time sending experts about the country, but they were very kind about it in my case.

9615. Are there any other points which you wish to touch on?—No, I do not think there are.

9616. You mention that there are one or two points in the training of students which in your opinion might be altered with advantage?—That was with regard to the marketing course and the apprenticeships which I have already referred to.

9617. You have given us your views as to that?—Yes.

9618. (*By Mr. Lamont.*) I should like to ask you, if it is not too inquisitorial, what particular branches of horticulture you have taken up?—Fruit and vegetables, and we combine that with poultry and flowers.

9619. Wall fruit and small fruit as well?—Yes, small fruit and apples and pears.

9620. What is your market—do you find a local market, or does most of your produce have to come to London?—No, it is local in Farnham and Aldershot and private customers; we are too small to send to London, we do not grow enough.

9621. Might I ask you what extent of ground you have?—Two acres only.

9622. You say that at Reading if all the packing were done by apprentices the produce would be spoilt to too great an extent, but do you not think that a certain proportion of apprentices might be added to the professional packers' department, so that some of the post graduate students could learn that very important part of the work without really injuring the sale of the College products?—Yes, I think that is possible, although of course they may do that now; it is nearly four years since I was there.

9623. Supposing one in three of the packers were apprenticed, the difficulty might be got over in that way, perhaps?—Yes.

9624. (*By Mr. Medd.*) How many of you are there engaged in the work?—Three.

9625. Do you employ any paid labour?—Yes, we have two boys.

9626. For rough work—hard work?—Yes.

9627. What wages do they get?—Six shillings a week each.

9628. With regard to the packing and grading, have you found yourself that you have suffered loss from your ignorance of it?—Yes.

9629. Have you ever visited Swanley?—No, I have not been there.

Miss A.
Miller.

19 June, 1907

Miss A.
Miller.

19 June, 1907

9630. I happen to be vice-chairman of their governing body ; we teach all our girls packing and grading as part of their regular course there, and I think we lose a considerable quantity of money in the process, but every girl gets trained efficiently, and I was going to suggest that it might be worth your while even now to go there and have a course of training in it ; it would mean a very small amount ?—Thank you, but I am afraid it would be impossible just at present.

9631. That is a matter, of course, for you. With regard to this apprenticeship system that you suggest, what would you propose that Reading should do in the way of apprenticeships—perhaps apprenticeships may be the wrong term ?—My idea was that certain students should be allowed to work in the garden, not exactly as students, but more in the way of apprentices.

9632. Half students and half apprentices ?—Yes ; to help with the practical work in the garden, having gone through their course of training.

9633. Did you find you had sufficient opportunity at Reading to learn all branches ?—Yes.

9634. Because they had not a large acreage of fruit garden when you were there ?—No, they had not, but still they had an orchard—they were planting it.

9635. The garden always seemed to me so very small for the number of teachers ; but you did get adequate instruction in every branch ?—I did. Of course you will understand in my own case I did not take the full course, but that was not their fault.

9636. I understand. The pursuit is one you would recommend to women who are not entirely dependent upon earning their livelihood ?—Yes.

9637. The effort and the anxiety of other occupations, with perhaps larger profits, do not counterbalance the small profit and the enjoyment of the open-air life and the interest that you take in horticulture ?—I think not.

9638. You are doubtful ?—Well, it depends so much on the individual.

9639. It depends upon the individual, of course, a great deal, but for many ladies I should think it is better than an industrial life. It is better, for instance, than typewriting and shorthand work. Do you know of any other fellow students of yours who are earning their livelihoods by gardening ?—Yes, I know one now who is working in Mr. Barr's nursery.

9640. As a paid gardener ?—Yes, doing special work—hybridising, I believe.

9641. Is she there permanently ?—I believe so.

9642. Do you know any who have gardens of their own who are doing market gardening ?—Not fellow students, except the one who is with us. Of course, we were a very small party when we started.

9643. You have not met with any who were at Studley or Swanley ?—No, we have not.

9644. We, of course, have many, and there are many ladies who are making a very good thing out of it, but they take pupils, and when they take pupils you cannot tell how far their profit and general income is derived from pupils and how far it is from the gardening ?—No.

9645. (*By Mr. Lamont.*) Do not you think it would be possible that what you will admit is a rather moderate success may be because your holding is so small a one relatively to the value of your house ?—Yes.

9646. Supposing you had four acres, you would not require to pay proportionately any more rent for the house ?—Quite so, but, I think, if you go further out into the country where the rents are lower, it would be more difficult to get the market and the prices.

9647. (*By Mr. Medd.*) Do you do any French gardening ?—No.

9648. You would make money by that. What do you grow, mainly ?—We grow small fruits and peas and beans and cauliflowers and carrots.

9649. Probably you cannot get beans early enough to command the early market prices ?—No, although we have a very early garden for an out-door garden.

9650. Yes, but probably you are not selling peas much before the end of June ?—Well, we are selling peas now.

9651. I think if you were to see one of these French gardens you would be very pleased. It is the newest form of gardening that has been introduced into England.—Thank you, very much.

9652. (*By Lord Barnard.*) What sort of accounts do

you keep. Do you keep merely a receipt and payment account, or do you attempt to keep a proper commercial account and balance-sheet ?—Yes, I attempt that.

9653. Were you taught that at Reading as part of your course ?—Yes.

9654. I should just like to test that on a question asked you by Mr. Lamont. Do you charge yourself with the amount of your rent ?—Yes, it is all covered ; the profit I make is after paying the rent of the house.

9655. In order to ascertain what the profit on the garden is you ought to keep the dwelling house apart altogether ?—In that case the profit would be considerably more.

9656. I think a great deal in agriculture depends upon the way in which accounts are kept. That is my own experience and it is also what we have heard here ?—That is so.

9657. Have you ever considered at all the question of co-operation ?—Only in a very small way.

9658. Have you ever approached the railway company, the London & South Western, I suppose ?—Yes, we belong to the Farmers' Co-operative Association at Farnham, and I believe that they approached the railway company. We have not, individually, of course.

9659. I believe it is the fact that most of the railway companies are quite prepared to entertain applications and to listen to representations by those interested in agriculture including horticulture. You have not actually gone to the railway company ?—No.

9660. To ascertain whether they can assist you in marketing your produce in any way ?—No, but, I believe, the Co-operative Association has approached the railway company, but it does not seem to have had any very satisfactory results.

9661. One word on the subject of packing. I suppose these expert packers at Reading must have begun somewhere ?—Certainly.

9662. Therefore, there must be opportunities for learning how to pack ?—There are, undoubtedly. Perhaps at Reading College they may teach packing now in their course ; they did not when I was there, and it was very much more difficult for a woman than for a man, when I was learning, to get that sort of instruction.

9663. You have told us that you did not think you could make a living, and I agree with you from the evidence you have given ?—I do not quite mean to say that I am not doing so at present, but I hope to do so.

9664. You have invested so many hundreds of pounds, and supposing instead of investing that money in this garden you had invested it in stocks of some kind you would have probably have got about the same revenue for it and had your time at your disposal into the bargain ?—I should not have thought so ; and I should not have had such an interesting life ; besides, I hope to increase the revenue.

9665. The point we have to consider, going back again to the terms of our reference, is whether we can report to the President of the Board of Agriculture that we are satisfied or not satisfied that women can make a living out of horticulture. What is your view with regard to that ?—I do really think that women can. The fault is, I think, that most women want to make too much out of it. They want to live as though they did not have to earn their own living, and I do not think they can do that.

9666. They would not be worse off than if they put their capital into something else, you think ?—I do not think they would.

9667. As we have been told, a great many of the women who are engaged in this business make part of their income by taking pupils ?—Yes.

9668. That may be all right from the point of view of the balance-sheet, but it would not be any use our giving that information to the Board of Agriculture, because it would prove nothing ?—No.

9669. (*By Mr. Medd.*) You do propose to develop your holding and extend your operations gradually ?—We do.

9670. You are now passing through an initial stage, and your experience has been such as to justify you in believing that ultimately you will make a good living from it ?—A living.

9671. You see just now you told Lord Barnard that you did not say you would not make a living, and now you rather qualify it to me again ?—I do not quite know what you mean by a good living. I rather wish to explain that

I do not think women can work a market garden and go out to tea-parties and to *matinées* and entertain their friends, and that sort of thing. I do not think there is enough in it for that, but if women care to go out into the country and live in a simple way it can be done.

9672. You would probably get more comfort from your occupation than a governess or an assistant in a shop or in a

trade or industrial occupation would get ; that is the idea ? —Yes.

9673. There is no discouragement in the idea that you cannot make a fortune out of it ; you cannot make a fortune out of heaps of things, and at any rate you have the means of living an interesting life and you are making, from your own evidence, profit ?—Yes.

Miss A.
Miller.

19 June, 1907

TWENTIETH DAY.

Thursday, 20th June, 1907.

PRESENT :

The LORD BARNARD (*in the Chair.*)

LORD MORETON.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Mr. A. E. BROOKS-HUNT (*Secretary.*)

Mr. H. L. FRENCH (*Assistant Secretary.*)

Sir JOHN MCFADYEAN, M.B., B.Sc., F.R.S.E., M.R.C.V.S., Principal of the Royal Veterinary College, called and examined.

9674. (*By Lord Barnard.*) I have in my hand a most interesting and, if I may say so, a most able account prepared by yourself of the history of the Royal Veterinary College, and of the subject of veterinary science generally. I delayed asking you to come in in order that I might consult the Committee for a few minutes on the subject generally ; and we are of opinion, on the whole, that we will not trouble you to go through the whole of what you have written here. Of course, Lord Moreton has the advantage of being well acquainted with the subject, and I and the other members of the Committee can read your account, so that we will not trouble you to go through the whole of it ; but just put one or two questions on your paper so as to bring out the essential points. You inform us that prior to 1791 veterinary science was not organised in this country at all ?—That is so.

9675. There were merely so-called farriers who administered the treatment ?—Yes. In fact, veterinary science anywhere may be said to date from the latter part of the 18th century.

9676. You inform us that the Odiham Society of Agriculture in Hampshire were the first to take it up, in 1790 ?—That is so : they really deserve the credit for having recognised the necessity of training men in veterinary science.

9677. Following on that, the Royal Veterinary College was by degrees evolved ?—Yes.

9678. It was well supported at the time by subscribers and so on ?—Yes, it was also supported by Government for a period of about twenty years, and it obtained an annual grant of £1,500, but that was withdrawn, I think, about the year 1815, and since that, until last year, the Veterinary College has obtained no State assistance whatever.

9679. At a very early date in the history you acquired your present site ?—Yes, it was acquired in 1792 or 1793.

9680. You have gone on developing that as means and opportunity offered ?—Yes.

9681. The College is now incorporated ?—Yes.

9682. You have power to grant a veterinary diploma ?—No. The Royal Veterinary College at the present time does not grant any diploma. For half a century after it was founded it was the only college in the kingdom concerned with veterinary education, and it almost necessarily had to take upon itself the duty of examining students and certifying that they were qualified to practise as veterinary surgeons. But about the year 1840, an agitation was got up among those who were practising as veterinary surgeons throughout the

kingdom and as a result, what is called the Royal College of Veterinary Surgeons obtained a Charter in 1844. The Royal College of Veterinary Surgeons is often confounded with the Royal Veterinary College. It is a distinct body. It is a corporate body made up of all the veterinary surgeons in the kingdom and the examination of those who intended to become veterinary surgeons was committed to them, and the Royal Veterinary College then gave up its own examinations. Since that it has devoted itself entirely to training.

9683. It takes no part in the examination of the students ?—No. It is one of the conditions of the Charter of the Royal College of Veterinary Surgeons that no teacher shall be allowed to take part in the examination of his own students.

9684. A diploma is granted by them ?—Yes, it is granted by the Royal College of Veterinary Surgeons.

9685. That was under an Act of 1881 ?—No, the Royal College of Veterinary Surgeons was incorporated in 1844, and empowered to hold examinations and grant diplomas, but for some years after that it was permissible for any other body to do so. The Royal Veterinary College, for instance, might have conducted an examination and issued certificates, but in 1881 what is called the Veterinary Surgeons Act was passed. That proceeds on lines very similar to the Medical Act, and it makes it an offence for anyone who does not hold the diploma of the Royal College of Veterinary Surgeons to call himself a veterinary surgeon.

9686. You have gradually extended the course of training ?—Yes. Originally it was intended—that is to say, at the end of last century—that veterinary students should undergo a three years' curriculum ; but it was found impossible, and it was not until 1876 that the curriculum was extended to three years, and for the last 14 years the curriculum has been a four years' one. The subjects of examination and of study have been proportionately increased.

9687. In your opinion, is the present examination a test of a very high qualification ?—No ; I could not say that it is a very high test. It must, from the circumstances, not be pitched too high. It represents the minimum qualification supposed to be necessary to entitle a man to engage in veterinary practice.

9688. Who does the examining now ?—The affairs of the Royal College of Veterinary Surgeons are managed by a Council elected by all the Members, and the Council appoints an Examining Board, there being one Examining Board for the whole of Great Britain and Ireland.

Sir J.
McFadyean.
20 June, 1907

Sir J.
McFadyean.
20 June, 1907

9689. You have entered into an arrangement with the University of London whereby a science degree specially designed for veterinary surgeons has been instituted?—Yes. To a certain extent the Governors of the College were anxious that a higher degree adapted to the requirements of veterinary students should be instituted, a degree which would, so to speak, confer a higher status on those who obtained it and which would therefore induce a proportion of the students to subject themselves to a longer training, and they approached the London University and laid these views before them, and the University has instituted a special degree for veterinary students.

9690. What is that degree called?—Bachelor of Science, and if the student proceeds far enough, he can become a Doctor of Science in veterinary science.

9691. In order to enable the College to train the students for this higher degree and qualification, you have found that it has been necessary to go to additional expense?—Yes, unfortunately in a sense we have, because I need hardly say the examinations conducted by the London University are of a higher grade and the training which is adequate to enable the ordinary veterinary student to get the diploma would not suffice at all to enable a man to take this higher degree and we had therefore to appoint one new teacher entirely; we had to ask others to devote a larger amount of their time to teaching and had to increase their salaries proportionately. We have had to make structural alterations in the buildings and spend a large sum of money in equipment: I mean as much as the governors could afford.

9692. Did that fund come from the corporate funds of the College?—Yes, but unfortunately the funds of the College have dwindled until they are on the point of disappearing.

9693. Do you get any grants from the Government?—We got a grant of £800 for the first time, last year.

9694. That is not an annual grant?—We hope it will be.

9695. What are your views, very shortly, with regard to what should be done as to the training of veterinary surgeons in the future?—My opinion is that if veterinary education in this country is to attain the level which it has already attained in most continental States, and to march on that level it will be absolutely necessary for the Government to lend some assistance to veterinary colleges. It is quite impossible, from the resources which they have hitherto had to rely upon, that they will be able to conduct veterinary education in the manner that it ought to be conducted.

9696. The parents of the class of men who become veterinary surgeons are not usually wealthy, are they?—No; they are usually the sons of people of limited means. I should think 25 or 30 per cent. of them are veterinary surgeons' sons, and sons of farmers are also among them.

9697. So that you cannot expect any additional income from that source?—No; it would be impossible, in my opinion, to increase the income of the Veterinary College by increasing the present fees, because if one were to attempt to do that, the immediate result probably would be that the number of students would be seriously cut down. Even at the present moment the numbers entering the profession is only just sufficient to keep the register at its present height. Last year, I believe about 50 men died off the register and 49 new men were added to it.

9698. You have considerable experience all over the country in connection with the profession, I have no doubt?—Yes.

9699. Do you consider there are more veterinary surgeons in the country than are required?—No; I do not. The total number of veterinary surgeons within the limits of the United Kingdom is about 3,000, and that includes those who compose the Army Veterinary Department and those who are occupying public offices. I do not think the number engaged in actual private practice is much in excess of 2,000.

9700. There are not many men who cannot get work, I presume?—No. In my opinion, an experienced man, provided he is a competent and sober man, has no difficulty.

9701. There is no risk in the falling off in the supply, is there?—Yes. I am afraid there is just a little for a few years. The number of students has fallen off considerably within the last two years.

9702. Any shortage would be a serious thing for stock owners and farmers?—It would. I feel rather concerned

about it myself from that point of view at the present moment.

9703. You are prepared to give us some general information as to what has been done in other countries, I think in Germany particularly, with regard to veterinary science?—I got some figures out just to show how the Governments of the principal continental countries have interested themselves in veterinary education. I think in almost the whole of the European States, veterinary education has received great assistance from the State. I have not got the figures as to France, but in France and Germany, veterinary education receives large endowments from the Government. In the German States, I find in Saxony, for instance, the annual grant amounted to 128,000 marks; Bavaria, 200,000 marks; Hanover, 73,000 marks; Prussia, 112,000 marks, and Wurtemberg, 91,000 marks. Then in all these States also, very large sums have been spent within recent years in new buildings and equipment, and the whole of the veterinary schools are really in an excellent state, both as regards extent and equipment. The most recent one, I believe, is in Hanover, which has just been built within a few years at a cost of £150,000; £90,000 was also spent on the veterinary college in Saxony; £57,000 on the one in Bavaria, and the one in Wurtemberg has also been rebuilt at a cost of £36,000.

9704. You know, of course, the terms of reference to this Committee?—Yes.

9705. We are to report to the President of the Board of Agriculture on the subject of scientific and technical instruction in agriculture. The question of veterinary education, to my mind, hardly comes within the scope of that reference; I do not know what your opinion is?—I should have thought that it did, because in my view the veterinary profession is almost entirely the servant of agriculture, and I think it is of the greatest interest and importance to agriculture that the veterinary profession of this country should be composed of men as thoroughly educated as possible in connection with the subject of their profession. I think that the country would reap great advantages from having better educated veterinary surgeons. Agriculture has already reaped great advantages from possessing such veterinary surgeons as it does now.

9706. You invite us to make some reference to the subject of the instruction of veterinary surgeons in our report?—Yes, I certainly should invite that; I am anxious to induce the members of the Committee to adopt the view that it is of great importance for agriculture that veterinary education should be assisted. It is not only of importance that the veterinary colleges should be able to turn out veterinary students well instructed in the facts known at the time, but it is also of immense importance that some amount of research should be constantly carried on in this country. It would be a discreditable thing to this country if there were no actual advance made in veterinary knowledge by the profession, and that we should have to subsist on the crumbs, so to speak, that fall from the table of the continental veterinary colleges.

9707. The Royal Agricultural Society have assisted you, have not they?—Yes, they have assisted us really liberally. For a long time—I cannot say how many years—they gave us an annual grant of £200, and then for a period of 15 years the grant was £500, but unfortunately, when their own finances became embarrassed, they felt compelled to reduce it to £200, and at present they give us an annual grant of £200.

9708. So that the premier agricultural society of the country recognises that your institution comes within the scope of agriculture?—It always has done that.

9709. (By Lord Moreton.) I am right in saying that the Royal Veterinary College, in return for the grant of money received from the Royal Agricultural Society, gave special facilities to its members, am I not?—Yes, that is so; and indeed the grant of £500 was originally given to assist towards founding the chair which I myself occupy, the Chair of Comparative Pathology and Bacteriology, and one condition of the continued grant is, that we shall investigate local outbreaks of disease when called upon, and in the case of an outbreak of any public interest, that we shall also do it without expense to the person who calls in our aid.

9710. (By Lord Barnard.) Of course, your opinion and assistance must be of very great value in connection with the Diseases of Animals Acts—invaluable, in fact?—Yes, I do not think it would be too much to say that

what we do in that connection is invaluable, but I think that we might do more than we do at present if our income were increased. My view is that, within the next few years, there will probably be an increased demand for veterinary surgeons in connection with public work in the control of contagious diseases, and in order that men should be able to engage in work of that sort, they would require some special training which we are hardly able to give them at present.

9711. Do some of your students go abroad, or do they mainly practise in this country?—Very few go abroad. A considerable proportion in the past have gone to the different Colonies, but that is practically stopped now, because most of the Colonies have veterinary colleges of their own, or intend to have them.

9712. You do not happen to know, I suppose, whether the Colonial Governments support these colleges in any way?—I believe they have not yet done so, but as President of the Royal Veterinary College, I have recently been in communication with the Premier of New Zealand, and he informed me that the Government of New Zealand has decided to found a veterinary college there.

9713. With regard to the army, do all military veterinary surgeons pass through the college?—They have to study at one of the veterinary colleges, and to pass the same examinations as those intending to go into civil veterinary practice.

9714. Is there an Army Veterinary School?—There is an Army Veterinary School, at which the young men who have just been admitted to the Department get a little special training in the duties of army veterinary surgeons.

9715. What other institutions are there in connection with veterinary work?—In Scotland there were until recently, actually three veterinary colleges. One of these has recently been moved to Liverpool, and there is one veterinary college also in Ireland.

9716. There are certainly public appointments open to veterinary surgeons now in connection with local corporations?—Not very many.

9717. A gentleman I dare say you know very well, Mr. Clement Stephenson, was the other day at a meeting of the committee of the College at Newcastle, with which I am associated, and was discussing this very question, and he informed us that he was veterinary officer to the City Corporation, or he had been at one time?—He was at one time.

9718. And in that capacity he had very important duties to perform in connection with the cattle market?—Yes, and other large towns, such as Birmingham, for instance, have veterinary surgeons who are the servants of the corporation. They are not allowed to engage in private practice. There are two at Birmingham, and in the same way there are veterinary surgeons in the service of the Corporations of Liverpool and Manchester.

9719. There is an increasing tendency to secure healthy food for the people, and that kind of thing, so that public officers of that kind are likely to be in increased demand?—I think they are bound to be.

9720. There will be a public necessity for them?—Yes.

9721. So that, from that point of view, it is very important that there should be a supply of that class of men?—Very important.

9722. In the Annual Report of the Board of Agriculture and Fisheries on the Distribution of Grants for Agricultural Education and Research, there is a column in the summary table at the end showing the sums expended on farriery and veterinary science by the various counties. I see that the total last year is just under £3,000. I should imagine—I do not know—that a considerable portion of that was for actual farriery work—practical work?—Yes.

9723. The Committee would very much like to have your opinion—put it as you like best—on the general question of training farmers in the elements of veterinary science?—My view is that it would be a very good thing if every farmer could be taught the elements of what may be called veterinary physiology and hygiene. It would be a great advantage to him to understand a little of the construction of his animals and the mode of working of the various organs during health. It would also be a great advantage if he had sufficient knowledge to enable him to roughly

diagnose what are called the scheduled contagious diseases, because the law lays on him the duty of reporting these diseases. But it is not my opinion that it is either necessary or advisable to teach the farmer or other layman anything whatever with regard to the treatment of animals.

9724. (By Mr. Latham.) How do you propose that the farmer should get that information?—That I am not prepared to say. I should think it would be an impossible task to give every farmer this education; necessarily, it would have to be given to him while he was young. I said it would be a good thing for him if it were possible, but I confess that I do not see that it is possible to do this until every intending farmer has been through a course of what might be called agricultural education, and I freely admit that the other subjects of his education are more important than even this.

9725. I so very much agree with your remarks that I should like to mention that we had Mr. Cave before us yesterday, who was connected with Wye College, and he showed us the sort of syllabus of instruction that he gives to the farmers generally, and to the young men in the college, and I thought it was almost impossible for him to stop at what he thought was right without going on to what you think is wrong?—I should not have any difficulty in drawing the line between veterinary hygiene and the practice of veterinary medicine and surgery. I believe it is very difficult for lecturers to draw the line, because farmers will insist, and it is a mistaken notion, on being provided with prescriptions—the medicines that are to be given for this or that disease. That I believe to be fundamentally wrong, as wrong as would be an attempt to try to diffuse among laymen the knowledge of law that would enable them to safely make their own wills—it is just the same—or that one should attempt to teach a farmer the elements of clock making in order that he might keep his own clock in order. The farmer, in my view, will be best served by placing at his command the services of highly educated veterinary surgeons, so that when his animals are ill he will be able to call in a veterinary surgeon. But, as I have said before, I think it would be a very desirable thing if he could be taught some anatomy and physiology, and a little about the signs of contagious diseases where early diagnosis is, of course, of vital importance. There are few diseases of cattle where early diagnosis is as important as it is popularly supposed to be, because, unfortunately, we have not any specific remedy against any diseases. Therefore, in my view, the idea of teaching the farmer first-aid is ridiculous, because it presupposes that the farmer is able to make a correct diagnosis, and that is a thing that only comes from scientific education and experience. If the ailment is of a simple character, it would not be necessary to administer any medicine at all, but if the animal is really ill I think the farmer should not begin to pour drugs into it.

9726. What I more particularly ask you is this—I may say I am a farmer myself—we have a great many of these contagious diseases that I believe the ordinary farmer finds it almost impossible to diagnose. Unfortunately, an animal very often dies, and possibly the farmer does not think very seriously of it, and has it sent away; but afterwards it is found that it has been suffering from glanders or some other serious thing, and he is prosecuted. I was pleased to hear that you were coming to give evidence to-day, because I wished to ask you if you could give us some idea how that sort of thing could be avoided by means of veterinary education?—I am quite satisfied it would be impossible to train a farmer to make a correct diagnosis, but as a matter of fact the law does not lay on the farmer the obligation to diagnose any of the scheduled diseases. His duty is in certain circumstances to suspect them and report. Take, for instance, the case of anthrax. An absolutely correct diagnosis of anthrax is by no means an easy thing and demands in most cases a microscopical examination by a man of considerable skill and experience. It is very easy for the farmer to discharge his duty under the Anthrax Order, because his duty is, whenever an animal dies suddenly and unexpectedly, and without obvious cause, to suspect anthrax, and in my view, what would be necessary to teach farmers in regard to anthrax would be that important fact that, if a horse is found dead or an ox is found dead, anthrax should be suspected by the farmer, and the police should be notified. In the same way with regard to glanders, there are certain elementary facts that might be taught to a farmer that probably would ensure his

*Sir J.
McFadyean.*
20 June, 1907

not having in his possession a glandered horse for a considerable time without suspecting it.

9727. I am afraid the words "considerable time" are dangerous?—You could teach a farmer so much of the common symptoms of glanders, that whenever he saw these symptoms or anything like them, glanders would occur in his mind. I admit that the result of this would be that, in a good many cases, he would suspect cases that were not glanders at all, but that is a thing of no consequence; it is far better that he should report a considerable number of cases that were not glanders than that he should keep in his possession without reporting it an actual case of glanders.

9728. How would you get this education given to the ordinary agriculturist or the agricultural student?—As I said before, in the existing state of things, it does not appear to me to be possible to give this education to every farmer, but a great deal may be done, I think, by the diffusion of literature bearing on the subject.

9729. Would you feel that farm students should have a short course at your College?—No, we really would not undertake at the Royal Veterinary College to give to those who wanted to be farmers the sort of instruction that I have been advocating as good for them, because the whole of our resources have to be devoted to training, to the utmost of our ability, intending veterinary surgeons, and the sort of education that is fitted for the one is not fitted for the other.

9730. (*By Lord Moreton.*) We have heard of the good work the College has been doing both as regards the teaching of veterinary science and also, I may say, veterinary research. I want to ask you a straight question—perhaps you had best consider whether you wish your answer to be reported or not—is there, in your opinion, any danger of the College being obliged to reduce its efforts in that direction owing to the want of funds?—I am sorry to say there is imminent danger.

9731. Do you mind that being published?—Not at all. The Veterinary College must, like other bodies that are practically self-supporting, cut its coat according to its cloth. The governors have, as the only source of income, the fees which they get from the students and what they get from what we call the subscribers, and this grant—I do not know whether I ought to call it a small grant—of £800 which we have got from the Government, and when I say that the amount paid in salaries to the professors of the Royal Veterinary College runs to £5,000 annually, taking no account of what is spent in equipment and instruments and so on, it will be seen that £800 per annum is really small.

9732. I think I am right in asking you if it is not the fact that the teachers have had of late to be content with a considerable reduction in their salaries?—I regret to say that is true; the governors have been compelled to reduce the salaries of all the members of the staff.

9733. It comes to this, I take it, that supposing the Government saw fit to discontinue their grant, the College then would have to very seriously consider whether they would be able to continue or not?—They would have to go back to a condition of affairs that existed perhaps 20 years ago.

9734. (*By Mr. Medd.*) From what source do you get the grant of £800?—From the Treasury.

9735. Not from the Board of Agriculture?—I believe it was recommended through the Board of Agriculture; we should never have got it without the assistance of the Board of Agriculture.

9736. You have quoted the large grants that are payable abroad by continental Governments to veterinary institutions?—Yes.

9737. Can you tell me whether they are paid by the State through the Treasury, or through the Minister of Agriculture?—I believe they all come under the Minister of Agriculture's domain in Germany.

9738. I do not know Germany. I had an idea that both in Holland and in France they came directly through the Treasury as yours does?—I am not sure about France, but I should think that is quite possible with regard to one of the French schools, the largest one, because that is almost entirely a military veterinary school—I mean the one near Paris.

9739. Do you not think, admitting to the fullest extent the necessity for additional aid to veterinary science in England, that your better method would be to apply direct to the Treasury rather than to the Board of Agriculture?—The better method would be the one most

likely to succeed, and my impression is that we would be more likely to succeed if this Committee would recommend that money given to assist veterinary education would be at least partly spent in the interests of agriculture.

9740. You admit to-day that it was owing to recommendations from the Board of Agriculture that the Treasury made you the grant of £800?—I believe that our grant is classed with the grant to the colleges that are teaching agriculture.

9741. My only feeling is this, that since the Board of Agriculture has such a very small amount of money at its disposal, and elsewhere in other countries and here the State has directly assisted veterinary science as an object worthy of assistance in itself, it would be better both in your own interests, and in the interests of agricultural education if you came directly under the Treasury rather than under the Board of Agriculture. You require for your wants a very very large sum, do you not?—We could do with a large sum, but we would be thankful for a small one, I mean a comparatively small one. We are very thankful for what we have got, and I can honestly declare it is very inadequate for what we would like to do, and in a measure what we ought to do, but it would be a matter of indifference to us under what head the grant were put in the Government returns. As I said before, I feel satisfied that we should never have got this grant of £800 if it had not been for the Board of Agriculture.

9742. No, and very probably this Committee or the Board might recommend it, but it would ease the burden so far as pure education is concerned if the grant were payable to you direct by the Treasury rather than through a Department?—I should be quite content to have it through the Department, because the Board of Agriculture is very directly concerned in having the country provided with competent veterinary surgeons. It employs a large number itself, and an increasing number.

9743. I think everyone admits that it is most discreditable that veterinary science has hitherto been allowed to depend on private generosity. My only question was as to the source, and if you found you did receive it from the Treasury, would you not consider the possibility of making the Treasury itself the source for that grant?—As I say, we really should not care how it came, or how it were classed, if we got the assistance.

9744. (*By Lord Barnard.*) The medical profession do not obtain any assistance from the Government, do they?—Yes, the medical profession has obtained very large assistance from Government funds indirectly, owing to the circumstance that medical education has been very largely conducted through the universities. For instance, in Scotland medical education has been most extensively subsidised by the Government; nearly all medical education in Scotland is conducted in one or other of the universities.

9745. You think you ought to have at least as good treatment in the interests of agriculture—you ask that we should put it in that way?—Yes, I should like to put it in that way, that the only justification for the demand is that it would pay the country, and it would pay agriculture for the country to give something towards promoting and improving veterinary education, and that if assistance is not given it appears to be inevitable that it will actually retrogress.

9746. You are pretty well acquainted, I dare say, with the agricultural profession?—Yes.

9747. You know, as a matter of fact, that agriculturists are far from wealthy?—Yes.

9748. Therefore you cannot look to those engaged in agriculture to assist very largely?—No, we recognise that!

9749. The only way of assisting the profession is through the State?—That I believe.

9750. I have just been looking through this official report again, and I see in most cases the colleges describe their veterinary officials as lecturers in veterinary hygiene. I suppose you would distinctly prefer the teaching of agricultural students to be in the principles of veterinary hygiene?—Certainly, I should highly approve that, and the more they are taught veterinary hygiene and physiology and anatomy the better, but, as I said, that is probably subsidiary to other branches of agricultural education.

9751. Those subjects had better be taught by

veterinary surgeons, I suppose?—Yes, probably it would be impossible to get anyone else competent to teach it.

9752. With regard to farriery in the agricultural colleges, that would be probably taught by a working smith?—Yes, I class farriery on an entirely different plane, because farriery is a mere handicraft, and all that is required to be taught of the theory of farriery to a shoeing smith can be taught in a very short time.

9753. Does not the ultimate excellence and the efficiency of the shoeing smith's work come from a knowledge of veterinary science?—That is true so far as it is necessary to teach the intending farrier the anatomy of the horse's feet, and he had probably better be taught that by a veterinary surgeon, because again it would perhaps be difficult to find anyone else who was competent to teach that.

9754. Therefore the view of the veterinary profession is, that its services are essential to agriculture?—Yes.

Sir J.
McFadyean.
20 June, 1907

Mr. JAMES PETER, called and examined.

9755. (By Lord Barnard.) Will you tell us the position you hold so that we may appreciate your evidence and the reasons for your coming here to-day?—I understand you want to know what work we have been doing with regard to the agricultural education of young farmers at Berkeley.

9756. What is your position?—I am steward and land agent to Lord Fitzhardinge, at Berkeley Castle.

9757. You have interested yourself in the agricultural education of young farmers?—I have for many years. We have an agricultural society which is called the Berkeley Hunt Agricultural Society, and which has been in existence for some 17 years. We started in a very small way, and we have been keeping it going for a great many years. We have got a very good acting committee, and we have come to the conclusion that agricultural societies, to be any good at all, should exist for educative purposes as well as for the holding of annual shows of stock, and so forth. We have interested ourselves in agricultural education, both for the sons of farmers and for the agricultural labourers, in the way of giving prizes for the best cultivated gardens, and for specimens of fruit, and that sort of thing, at the annual show. We also give prizes for hedging and ditching and thatching, and also hold milking competitions. In addition, there are classes for farmers' daughters in cheese making and so forth, under the dairy schools of the County Council.

9758. You merely organise those, I suppose?—Yes, we organise those at Lord Fitzhardinge's farm.

9759a 9759. At the expense of the County Council?—The dairy classes are carried out by the instructress of the County Council. Lord Fitzhardinge supplies the use of the dairy, and the County Council send down their butter maker and their instructors, because we want a good many going on all at the same time. We have carried that out with great success. The students learn the methods of making different sorts of cheeses—Stilton, Wensleydale, and also Cheddar and Double Gloucester, and so forth—and butter making also, and we have had very good results indeed. After that we thought we must do something for the young farmer. It was suggested at one of our annual meetings that there had been nothing done for the young farmer, and one of the members of the committee said he thought the young farmers ought to have some prizes for hedging and ditching and thatching. I, as chairman of the committee, suggested that there ought to be something more advanced for the young farmer's education than just hedging and ditching, and so we formed ourselves into a sub-committee, and drew up a scheme for the examination of young farmers on agricultural matters generally, including competitions in practical work. Lord Fitzhardinge came forward liberally and offered a prize of £10, and our Society offered prizes of £5 and £2 10s. in addition. This is a sample of the schedule. (Handing document). It says: "For members, members' sons, or employees of a member, under the age of 25 years, and residing within the limits of the Berkeley Hunt, who shall:—(1) By an oral and written examination best satisfy an examiner as to their general knowledge of practical agriculture. (2) Most correctly estimate the relative values and weights of a number of cattle, sheep and pigs to be submitted to them, and pass their opinion as to the value and soundness of cart horses. (3) Thatch a rick in the best and most workmanlike manner on the farm where they reside. Note.—Three days' notice must be given to the Secretary before this work is commenced." Notice has to be given before they commence to do any of the thatching to the secretary, so that a member of the

committee may go and see the young farmer actually doing the work, and in order that he may not be helped by anybody who might be giving him a hand with the work. He must give that three days' notice, and one of the committee goes and sees that he does the work himself. Then he has to execute two perches of hedging and ditching in the most workmanlike manner. The time allowed for that is five hours. In addition to that there is a ploughing competition. Last year was the first competition, and it was very successful indeed. We had an expert down to show the young farmers' sons how to plough, but we found that the young farmers were better men than the expert was. Then there is another thing we want to encourage more than anything else, and that is the live stock of the country, which I look upon as the sheet-anchor of agriculture at the present day. We have a new class this season. This is the schedule for that: "For members, members' sons, or employees of a member, under the age of 25 years, and residing within the limits of the Berkeley Hunt, who shall:—Judge a number of cattle, and most correctly place them in order of merit. Give reasons for so doing in writing, on cards to be provided." The cards are provided at the show. We want to educate the young farmers to be experts in live stock and the market values of live stock. No country in the world produces better stock than we do, and the foreigner comes here from all over the world to replenish his stock from ours, and there is no question that the young farmer ought to be an expert in connection with stock and everything connected with agriculture. That is our ideal. Our chief aim is to give a practical acquaintance with the business of farming, and a general knowledge of applied science as to feeding-stuffs, and manures, and a practical acquaintance with the treatment and market values of stock. Those are the chief features we try to cultivate, and I think we have been very successful indeed. The young farmers have taken particular interest in it. The only weak part of it where we are very much handicapped with the young farmer is, in the rural districts, on the question of elementary education. They have not got facilities to continue their education after their elementary standards are passed at the age of 14. A lot of our farmers are small farmers, and there are a good many small tradesmen in the rural districts, and they are not in a financial position to send their children away to school, say, at Gloucester or Bristol, or wherever it may be situated, which would mean a cost of £20 a year in travelling. Small farmers cannot do that, and we find that the elementary education of their sons is at fault; and at these technical schools that we have in the winter we find they cannot grasp the syllabus of the technical instruction, such as the relation of chemistry to agriculture and so forth, but it is wonderful how after they have stuck to these classes for a time they get a smattering of knowledge. I will just show you one of the written examination papers which is put before these boys. (Handing document.) Those questions are put by the Professor of the Royal College at Cirencester, Professor Blundell. I may say he has been uncommonly good. These questions are pretty hard for a young man who has had no college education, and in fact who has had little other education than the education he has had at an elementary school up to 13 or 14 years of age. He goes through these examinations several times—he begins at 17 perhaps and works up sometimes till he takes a prize at 25. They have three hours to do that written examination in. They are put into a room; they know nothing about the questions they have to write upon; those questions are put before them, and they have three hours in which

Mr. J. Peter.

9759c

9759d

9759e

Mr. J. Peter. to answer them. Then the examination papers are all put up together, and the next day or the day after, Professor Blundell, of Cirencester, who is the scientific examiner, goes through them. Then the students have to go through an oral examination. They are taken into a room, and the professor tests their knowledge as regards practical agriculture. He will have cakes and feeding-stuffs, and also all the different seeds and grass-seeds and grasses. He tests their knowledge on those subjects, and after they have done that they have to go before a practical examiner. There are a number of animals put before them on Lord Fitzhardinge's farm, a couple of fat beasts, a pen of sheep, and a pen of pigs, and they have to give their ideas as regards their value and weight, and what they consider the qualifications of a dairy cow are and should be, and also what they consider the weight and value of a fat beast is, and the same with regard to sheep and pigs. Further, they have to give their idea as regards the value and soundness of a cart horse. We have had these classes since about 1900—this is about the eighth year. When we started these classes we thought that these boys ought to have a chance of educating themselves in order to make them more able to pass these examinations. Then we applied to the County Council for their agricultural instructor to hold the evening classes in winter, from October to the end of March. Those classes have been particularly well attended. I may say the boys come from seven or eight miles round, and I have known some come as far as 14 miles on a winter's evening. We had a class of 30 young farmers last winter, and there was an average attendance of 20. You can understand, on the dark winter evenings, when health is not quite so good as it is in the summer, the attendance may not be perhaps just the same as it would be in the elementary school in the day time, because those young men have their ordinary work to do, and so forth, and I think that shows that the attendance is very satisfactory indeed. We have gained a grant, I think; I believe for an attendance of 20, the County Council gets a grant from the Board of Education towards the expenses. At the same time the great want in rural districts is, that we want the continuation of education in some way or other put on to our elementary schools. I do not think there is any education for a farmer's son, or a labourer, like what they can have at home in their own parish, if only they have a technical school for that purpose, and it seems to me, with regard to farmers and small farmers who pay their rates for elementary education, it is a particularly hard case when their boys come to 14 years of age that they have not means of educating their boys unless they send them away to Gloucester or Bristol—the nearest towns where higher education is given—which is very, very expensive. Agriculturists are much worse off than the artisans who live in the towns; they get no chance to higher educate themselves, and if there was a continuation school in the district, I believe farmers would be only too pleased to pay certain education fees for it for their sons. My idea is this, that our elementary education is wrong, or at fault altogether. Of course, it is all right as far as it goes—I am not quite sure that it is all right as far as it goes even, because the education is badly given, and not as it ought to be in rural districts. We have a good schoolmaster, but he is not allowed to teach as he thinks best for the rural district, because he gets an inspector who will come in and say, "Your system is all wrong, and you must alter it completely."

9760. Do you not think it would be a very dangerous thing if every elementary schoolmaster were allowed to do just as he pleased in the way of educating his pupils? There would be faddists among elementary schoolmasters, you know, just as there are amongst inspectors?—I do not think there is any better system than the old parochial school system that we had in Scotland, where they gave a sound foundation in reading, writing, and arithmetic, which is fundamental anyhow, as regards education, to start with. That is not the end of education, however, although it seems to me in our elementary system it is the end in rural districts. We want something further advanced than that at the present time, because the rural districts are not supplied with higher education unless they go further afield for it.

9761. You have addressed some lengthy remarks to us on this subject of higher education, but you have not clearly told us whether you mean ordinary secondary education or whether you mean technical education in the science and practice of agriculture?—I say our ordinary education in the rural districts is not far

enough for the boys to grasp the technical classes when they go to them.

9762. The farmers in your part of the district, I gather, are only small men?—Yes, about 200 acres, some of them 100 acres, 150 acres, and 200 acres.

9763. Most of them can only afford to send their sons to elementary schools?—Yes.

9764. Are you a member of the County Council?—I have been, but I am not now. I am a member of the agricultural committee of the County Council.

9765. May I remind you that throughout the country a very considerable effort is being made to provide secondary schools, available for every district where they do not already exist?—Yes, but they are not yet provided.

9766. You must be peculiarly unfortunate, from my knowledge of England, if you have no local grammar schools or secondary schools?—There is a grammar school at Wotton-under-Edge, but that is miles away, and the boys can scarcely get there.

9767. You would not suggest that the country should go to the expense of having a secondary school in every village?—I should say there ought to be a further advance, or the standard ought to be increased to a higher state of education than it is at the present time.

9768. (*By Lord Moreton.*) You will agree with me that the county of Gloucester is a somewhat difficult one as regards the geographical side of the question. It is very difficult, for instance, for a boy on the Hills to attend school in the Vale district, especially in winter?—It is.

9769. And equally difficult for a boy in the Vale to go up and attend school on the Hills?—Yes, impossible.

9770. (*By Lord Barnard.*) We have heard from many witnesses here that in many districts of England farmers do make a great effort to send their sons to secondary schools, and do so?—They do: that is quite right: but I say the distance is really too much for a great many of these small farmers.

9771. Would you agree with me that in cases like those you have mentioned it might be advisable for the County Council to assist the scholar, if he is a clever enough boy to derive any advantage from it, to go to a secondary school by the aid of a scholarship?—Yes, I have studied that question.

9772. Are there any scholarships in Gloucester?—Yes, there are scholarships which are given by the County Council.

9773. Are they insufficient in your county?—They are.

9774. Then it is a matter for the ratepayers of the county to take up and press upon the Council the necessity for giving more scholarships?—Yes; but I am afraid there is too much put upon the ratepayers already. We want provision to be made at our elementary schools so that a boy, if he has finished his elementary standards at the age of 14, could go on and take higher education in his own parish. There is no provision made for that in the rural districts.

9775. How do you suggest that you could carry that out without an additional burden on the ratepayer?—I would suggest that the pupils should pay a fee adequate for the expenses, and then they would be able to do it without having to go and pay railway fares, and so forth, to go to Gloucester and Bristol, which would cost their parents £20 a year in travelling, and if a man has several sons it is a tax that he ought not to have to bear, and it ought to be provided for him at his own home.

9776. I think we are rather wandering from the subject, although it is incidentally of importance. You know the object of our enquiry is as to the provision which is now being made for affording scientific and technical instruction in agriculture. I have not stopped you, because it is a very important thing to consider how far a lad is qualified to receive scientific and technical instruction. Therefore, the question of his elementary education is of importance, but I do not propose to pursue that subject further?—I can quite understand I may be transgressing a bit, but before the boys can grasp that technical instruction they want to be educated to a certain extent.

9777. (*By Mr. Medd.*) Might I put one question which might settle it? I think what you have in mind are supplementary courses at the existing elementary schools?—Yes.

9778. Or the formation of a higher elementary school?

Mr. J. Peter.
20 June, 1907

—You might call it supplementary. I could give you an instance at our old parochial schools in Scotland. I have known scores of boys go to work the whole summer and then attend the parochial school and take a course there in the winter.

9779. You would desire at Berkeley a supplementary course or a higher winter elementary school?—I would have a higher elementary school if it could be provided.

9780. The difference is in the duration of time?—That is it. What we have done at Berkeley is this. We have been trying to improve ourselves in the best way we possibly can, and to train the young farmers up to give them a good knowledge of practice and science as applied to agriculture.

9781. The fault does not rest with Gloucestershire. It rests with the Board of Education?—Quite so.

9782. (*By Lord Barnard.*) I think the inference which I have drawn, and that the other members of the Committee have drawn, from all this is, simply that the elementary education provided for the young farmer is defective?—That is entirely the sum and substance of it.

9783. I do not quite understand what this Berkeley Hunt Agricultural Society is? Do the members pay subscriptions?—Yes; you will see a list of the members here. (*Handing book.*) We give something like £700 in prizes every year.

9784. You have described the methods of examination of these boys both in theory and practice; but you have not told us anything, I think, as to how they are taught either the theory or the practice?—This is the syllabus? (*Handing same.*)

9785. Are the teachers provided by the County Council?—Yes.

9786. That is part of the instruction for which you rely upon the County Council?—Yes.

9787. The Society is only really an examining body?—It is really only an examining body, and it gives prizes. That is the syllabus for the winter evening schools. (*Handing same.*)

9788. Would you agree with me that a good deal of the practical work to which you have alluded, the practical knowledge of stock, for instance, is acquired better by experience than in any other way?—There is no doubt about that, and that is what we are anxious to supply, and give them that experience and test their knowledge on that.

9789. I do not think I understand you to suggest that this Committee should recommend that scientific and technical instruction in judging stock should ever take the place of the practical experience which is gained by the boy on his father's farm or on somebody else's farm?—No, he gains that on his father's farm, and he is put to the test when he comes to the competitions. I mean they would not take that interest in their father's stock if it were not for these prizes that we have instituted.

9790. You say your great object is to make the young man a really good practical farmer?—Yes, that is what I say—that education—and if that higher education were provided in our rural districts the boy could get his practical knowledge from his father and could do a certain amount of work before he went to school and after he returned from school.

9791. The object of your awards is to encourage men to turn out good practical farmers?—Certainly.

9792. I do not know whether your experience is the same as mine, but I venture to think from an acquaintance with farmers in no less than three counties, distant from each other, too, that as a rule the British farmers are undoubtedly good farmers and extraordinarily good practical men?—No doubt, but I think the more instruction they can get the better. I would make them more observant of everything connected with the farm, and make them more particular in everything connected with the stock and looking after the stock, and also with everything connected with agriculture.

9793. As to the scientific side of agriculture, although you deprecate it for the bulk of farmers, I do not understand that you suggest that it is not necessary at all?—No, I do think it is necessary.

9794. You would not propose, for instance, that all these colleges which are marked on that map there should be swept away as being a useless waste of public money?—I am afraid that a good deal of them is waste.

They do not serve the agriculturist. They are too far apart for agriculturists or for young farmers generally. Take the system they have in America. They get almost free the instruction there. I spent a day at Guelph College, and I was surprised at the work they do there. I asked the professor, "Have you followed up these boys to see what becomes of them?" and he said, "That is almost impossible, but it is astonishing the amount of good they do when they come back in the autumn session. It is like putting leaven into dough. It spreads into the whole country and does an enormous amount of good." I do not think the boys are any more intelligent in Canada than they are here, but at the same time they have all those advantages, and they go for a whole session and get that for nothing for the work they do. The facilities they have for seeing the scientific and practical work are very, very great.

9795. Have you visited any of these colleges in this country?—Not yet.

9796. Then it is hardly fair to compare a college that you have visited with one that you have not visited. Do you think it is possible that when you have made a closer investigation of our own colleges, say the Harper Adams College in Shropshire, that you might perhaps modify your views somewhat?—I am only speaking from what I have seen of the gentlemen who come from these colleges as instructors. They are not particularly good samples, and we are very badly off for instructors, even those who are appointed by the County Councils. When they have come to Berkeley some of the boys there have put questions to them which they have quite failed to answer. I take great interest in this class in the winter evenings, and I am often there, and you would be surprised at the questions that are put by the boys to the instructors that are supplied by the County Council, and the instructor is often quite unable to answer the questions they put to him. That is what we are short of in this country—good agricultural teachers.

9797. You will bear in mind that 20 years ago there was hardly any instruction of the kind at all in the country?—Yes, but things have very much altered since then.

9798. For the better?—As regards education it is for the better. Of course we are not going into the political part of the matter, but farming now to what it was 50 years ago is altogether quite different.

9799. Perhaps in the course of time by persons like yourself and others taking trouble we may evolve some better system?—I think you will acknowledge, seeing the depreciation there has been in agriculture, taking it altogether, that people have educated themselves to keep up with the times and have been able to struggle with the times much better than they were between 1879 and 1890. They have educated themselves on cheaper methods and they have adapted themselves to the times now, and agriculture is in a more prosperous position than it was 20 years ago.

9800. (*By Lord Moreton.*) I think it would add to the interest of your evidence if you would give the Committee some idea of the ground you cover, either in miles or in acres?—We go from Bristol to Tewkesbury. That is about 50 miles in length and about 12 miles in width.

9801. Looking at the list of your subscribers I see the bulk of them come from the Vale?—Yes.

9802. I suppose you take special care that the questions asked at your examinations should be those of a nature to bring out the knowledge of the candidate as regards local agriculture—there would be local colour given to the examination paper?—I do not exactly follow.

9803. A candidate for Berkeley, for instance, would not be asked a question dealing with a system of farming which was carried on in the North of England?—Certainly not.

9804. So that your system is chiefly in the improvement of local agriculture?—Yes.

9805. You rather limit it to the requirements of the county?—We do.

9806. I see one of your questions begins: "If you were farming a farm of 200 acres at Lady Day;" and another begins: "If you were taking a farm of 300 acres at Michaelmas?"—Yes.

9807. Would those two papers apply to boys both in the Hill and the Vale?—Yes, it would as regards cereals and getting information from valuers.

9808. Have you any limit as regards age?—They come about 16 or 17.

Mr. J. Peter.
20 June, 1907

9809. I suppose the ordinary age would be from 16 to about 20?—Yes. They want, of course, to get prizes and certificates, and many of them get near 20 or 22 before they get a prize. They have to study several years before they become first prize men.

9810. (By Mr. Latham.) I have very much enjoyed your general evidence, but are we to take it in this Committee that the farmers of the last generation were badly educated?—No, but they lived under different circumstances altogether to what they do now.

9811. Were not the circumstances of our forefathers very similar as regards education to what they are at the present day?—I doubt that, because they did not have the competition to contend with that they have at the present day.

9812. Will you just kindly say what that competition is?—Take this, for instance—the competition of the Colonies and other countries, which are just as near our markets as regards the rates as a great many of our own farmers are to the markets themselves.

9813. Why is it necessary that the State should take up this education for the farmers and farmers' sons, as you have described?—The State does equally much for the great centres of population, and it seems to me that agriculturists ought to be as highly educated men to work out their business as what they are in the large centres of population, and surely the better educated men are, both in practice and science, they are not so likely to be a failure as a man that has not got it. There is no doubt that there are a great many small farmers without that knowledge—men who have not had a college education—but I think men who are highly educated are more likely to succeed than those who have not had the facilities of education.

9814. With that I expect we all agree, but you made a remark just now that you thought the scientific centres were not of much value to the agriculturist?—I do not know that they are. Where they get so much science they would be rather deficient in practice.

9815. I thought that some of the best farmers of the day, some of our older farmers, our forefathers, were simple and entirely practical men, and what I want to know now is why they have not brought down in their generation from father to son the education that is necessary for the rising generation?—I look upon science not as practice, but as the handmaid of practice.

9816. Why should not the father teach the son instead of being obliged to go to the State for all this practical education?—So he does, and I say there is no better education for the farmer's son than what is instituted at home, and if he can do a certain amount of work which he can do before he goes to school, and after he leaves school at night, it would be an advantage. I am only speaking from practical experience of what I had to do myself.

9817. Most of us know you pretty well, and do you not think if it had not been for the great industry and exertions you have made in your own district that possibly all we have been talking about here to-day might never have existed?—Possibly that is so, but I think it is a matter, as good citizens, that we ought to do our utmost to improve our fellow men in any possible way we can, and to improve the industry in which we are interested. I may say the only pleasure I ever had in all my life has been in work, and that is what we like to teach our children, to love work, to take an interest in it, and if you only put it before them in that interesting sort of way, to love the agricultural industry and take notice of all the farm crops and the animals and so forth—if you give these boys that knowledge I am certain a great many of them would come to our classes. Their parents do not give them the encouragement that they ought to do, and we find when they do come they are far brighter and far more observant and much keener in the market as regards the value of stock and the live weight of them, and in every way. We have feeding experiments going on, and take them out and shew them the different rations and so forth, and there are the judging and valuing competitions every month. The boys judge them for themselves and then they see them weighed, so that when they go to a market they have some knowledge of what stock is worth.

9818. I very much agree with all this, but what I want to know is why you want to go to the State?—I am not going to State. What we are doing at Berkeley is for self-improvement, but if you can give us some help from the State it will be a great help to us.

9819. I do not think you can expect every man—you will not get it if you do expect it—to be similar to yourself in each district?—If you go to the Colonies and the States, and look at what the Governments are doing for agriculture there; they are bringing knowledge to bear on the young people, and they get into it at a much earlier stage of life than the farmers do in this country. They put everything before them. The right kind of corn to plant, and the seeds, and everything connected with agriculture. Everything is put before them. The farmers in this country have not got that advantage, and that is why I say we are at a disadvantage, and that the State ought to help us.

9820. Do you consider there is a general desire throughout the country—do not take your own district exactly—amongst agriculturists for this education?—I do, if you can only get anyone in any district to take the lead. If you cannot do that; if there is no desire on the part of anyone to take the lead, it is a failure, but if you get someone to take the lead, and take an interest in it, and talk to the agriculturists in the matter, you will see they will come into it fast enough, but without that there is no success whatever; you must keep on the whole time.

9821. We are obliged to come to the conclusion from your evidence that the general education of the farmers is very much neglected?—Yes, especially with the small farmers. That is the class we want to encourage, and to have more people living on the land. We want as many as we possibly can, and not to send them off into the towns.

9822. From the evidence you have given to the Chairman, although you do not wish so much scientific knowledge, I see you have a man from a scientific centre always to be your examiner?—Yes.

9823. Do you think that is better than a thoroughly practical outside examiner?—We have a practical examiner besides. The Professor is one of the Professors of the Cirencester College; the oral examination is practically a practical examination on practical questions—the different grasses, and seeds and so forth—so that they may be conversant with all the different plants, manures and feeding-stuffs, and their compositions. I think it is necessary for a farmer to be able to know their compositions.

9824. Does he set the papers, or does the practical man set the papers?—The Professor sets the papers.

9825. Do you give any prizes for the best-managed farms in your district?—No; but we have for the best-fenced farms; not for the best-managed farms. We have not got money enough to take that up.

9826. Would that be a thing you would recommend?—I think it would be a very good thing indeed; I should recommend it, if we had the money to do it.

9827. I see you say you have encouraged the better making of butter and cheese. How is that done?—In cheese-making an instructor and instructress are supplied by the County Council from money that is voted towards the agricultural side of the technical education question. They send the instructors down and we supply the dairy and everything connected with it.

9828. That is a local thing?—That is a local thing; but they have a dairy school at Gloucester connected with the County Council, and pupils go up there.

9829. That is not a travelling school?—No, but they have a travelling school at times that goes to different parts of the country where the facilities and accommodation are supplied.

9830. That is simply confined just to butter making, is it?—No, cheese-making as well.

9831. I am speaking of butter now. There is nothing about the preparation of cream before it is brought to the dairy, or the treatment of dairy products afterwards?—They buy cream for that purpose; they buy it according to the quantity the cream will produce after churning.

9832. That could be very much better started if it began with the milk?—Yes, that is where I find fault with the County Council. I say they ought to see the milk produced on the farm and deal with it from the very commencement, but our County Council and the Education Committee do not see it in that way.

9833. With regard to cheese-making, is that a stationary thing?—Yes.

9834. Always at one centre?—Yes at Gloucester,

unless they send out a class every now and again where they are asked to. But they have not done that lately. It is all at one centre at Gloucester, and they buy all their milk for the purpose.

9835. There is no knowledge imparted as to the value of certain land to produce a certain quality of cheese, or where there is anything faulty in the land with regard to the cheese production?—They have not done that, and I think that is a very important matter.

9836. If it could be done on a larger scale, and more widely done, it would be even better than the way in which you do it?—It would; I think it would be of great service.

9837. With regard to the scholarships that are offered by the County Councils, how do you make use of them?—They are given for boys who pass an examination; I think it has only been instituted for about a twelve-month. There is so much for agriculture and so much for artisans. They can choose their own colleges to go to. I think there are two scholarships for agriculture and so many for other professions.

9838. What colleges are generally chosen?—I think they can go to Wye College or to Basing or to Reading.

9839. With regard to the question of the schools that you went into so thoroughly, I should like you to tell me how you think it possible that secondary education attached to the elementary schools, at the public expense, could be done without creating a certain amount of feeling amongst the ratepayers?—I did not suggest at the public expense at all. I suggested that the farmers should pay fees according to the expense after the elementary standards were passed.

9840. Who was this education for?—For farmers' sons and tradesmen's sons in the rural districts.

9841. Not the labourers?—Certainly, the labourers, too—for all in the rural districts.

9842. Would you tie them down to any particular fees?—Certainly.

9843. What would be about the amount of the fees?—Of course I have not gone into the matter very carefully yet, it would depend on the number of pupils that would apply, and I have no doubt a great many would apply—farmers' sons especially—up to the time they were 15 years of age.

9844. Do you think the farmers would like to lose the services of their sons while they were attending these schools?—They would not lose their services, they would have them if they had that education in their own parish before the boy went to school, and after he returned.

9845. They must go at some time in the day to attend these classes?—Of course they would.

9846. I find in my own district that farmers, when they have got a son who is anything like 15 or 16 years of age feel that he should be employed on the farm, and they do not like the idea of giving him any longer education?—Yes, but our boys leave at 14 and they have no chance of any other education unless they go to these centres.

9847. Would not it be better to let them go on and get as much education in early life as they could get?—You do not think 16 is too old for a farmer's son to leave school?

9848. I do not think it too old, but how many of them are kept there as long?—That is the fault.

9849. That is the farmer's fault?—If they are small farmers they cannot afford to send their sons away at an expense of £20 a year in travelling to a town for higher education, so what are they to do?

9850. What should the higher education be?—If they go to a secondary school, such as Bristol or Gloucester, certainly they would be above the sixth or seventh standard in the elementary school, but from what I hear, after they leave the elementary parish school, and go to Gloucester and Bristol, they are generally put into a lower standard than what they have been in in their own parish school.

9851. I rather gather from the answers you gave to the Chairman and to Lord Moreton, that you do not want much science, and I cannot see exactly what these boys are to be taught after they leave the elementary schools in these higher elementary schools that you advocate?—After they leave the elementary school as it is now when they are in the sixth or seventh standard, they soon forget what they have learnt unless it is refreshed after they are 14 years of age, that is in what I call reading, writing, and arithmetic and composition, and they

ought to have certainly a little grammar or something of that sort, and they ought to know something about the countries of the world as regards geography, and if a boy leaves at the age of 14 and does not go to school again he has lost the great advantage of improving himself for the whole course of his life.

9852. You want the boys to go to a higher school, not a State school, but to be paid for by the parents?—If we could have a continuation side to a State school or an elementary school, it would avoid these boys going away from home to the grammar school in the large centres.

9853. Do you advocate agricultural sides to these schools?—Certainly.

9854. You think they can be taught at these ordinary schools agriculture better than they would if they went to some of these colleges?—I do, because they get such a lot of practical agriculture at home.

9855. Do you think they can teach them practical agriculture?—Yes; from what I saw in Canada it is practical agriculture they teach them, and science as well; and from what I have seen of our pupils, some of the students of the Society who have been examined in practical agriculture, and from their examination papers—I have seen their papers—they compare favourably with these boys who have been examined at the Royal Agricultural College at Cirencester.

9856. Do not you think if we could have some of these scholars allocated to such men as yourself they would be very much better educated in agriculture than they would be at these colleges?—I should not like to answer that question.

9857. That is just the question we want answered. Do not you think a practical man can teach farming better than an institution of any class?—There is no doubt, without practical knowledge, science is no good whatever. I look upon science as the handmaid of practice.

9858. After that you would agree they could have a little science?—I would. I should like it myself. The more science I have the more I like it, because I like to know the composition of things.

9859. (By Mr. Medd.) The work at Berkeley was organised quite privately, was it not?—Entirely.

9860. You had, of course, the consistent help of Lord Fitzhardinge?—Yes.

9861. He has always been interested in it?—Yes.

9862. Your object in coming here to-day is to show that by enterprise and perseverance there is no reason why each rural district in England should not have similar opportunities to yours?—Certainly.

9863. You are more interested in considering the requirements and the needs of the son of the small farmer and the labourer?—Certainly.

9864. That is what you are here for?—Yes.

9865. I dare say you have heard of, or perhaps you were at, a school developed under the Dick Bequest in Scotland?—No, never.

9866. I thought perhaps you had from what you have said. To make it perfectly clear: what you do need is an expansion of your existing elementary school to collect the children from the immediate neighbourhood?—That is right.

9867. You believe that the labourers and the farmers would be willing to pay a fee for the attendance at such a school?—That is my belief.

9868. Probably you are aware that the farmers in the North Riding, when applying for exactly such a school expressed their readiness to pay fees?—That is my opinion, that they would.

9869. As a matter of fact, they did in that case, and they were hindered by the Board of Education. Much has been said as to your criticism of these collegiate centres. I may say that in organisation and in work they are almost identical with Guelph, which you visited and liked, but your objection to them to-day is that they are not, and cannot from their constitution cater, for the son of the small farmer and the labourer?—That is my experience.

9870. They serve a different function?—They serve a different function.

9871. If you are to supply the needs of the small man, whether the small farmer or the labourer, you want a different type of organisation?—I think so.

Mr. J. Peter.

20 June, 1907

Mr. J. Peter.
20 June, 1907

9872. (*By Lord Barnard.*) You told Mr. Medd that you thought it would be an advantage if other districts had a similar organisation to what you have to carry on the same work as you do?—That is my opinion.

9873. Do you think that in every district in England you could get such a liberal list of subscribers as you have at Berkeley?—If you have the same area, I do not see why you should not.

9874. I should like to enlist your services as a supporter in the part of the country I am in, where I think the areas are as large as they are in most parts?—I think if the people in the district will only interest themselves in the matter there will not be any difficulty in it being taken up. Of course we have a pretty good district, and they are nearly all farmers who subscribe.

9875. There are an enormous number of subscriptions of £5?—They are vice-presidents. Of course we are a hunting district, and a great many subscribe £5.

9876. Do you agree with me that it would be almost impossible to get such a subscription list in most districts?—At any rate, these prizes and that sort of thing might be offered at not a very high cost; we do all these things in connection with our show.

9877. You have a show of considerable importance, according to the list I have been looking at; is it the only one in the district?—No, there are several.

9878. Would not it be a somewhat serious burden upon landowners if they had to support by subscriptions such an enormous number of local societies for doing this work?—It would come pretty hard on landowners, but still Lord Fitzhardinge—

9879. I am rather speaking generally. You are rather suggesting that these societies should be multiplied?—No, I do not say they should be multiplied. I think we have too many of them as it is now. I think they ought to be amalgamated, and that it is no use unless you use these agricultural societies for educational purposes. That is what we do, and that is why we have succeeded so well.

9880. Do you ever receive the leaflets of the Board of Agriculture?—Yes.

9881. Are you a Correspondent of the Board of Agriculture?—I was asked to take it on, but I was not able to do so. I have not seen any reports of these correspondents, and do not know what has become of them.

9882. (*By Lord Moreton.*) Do you happen to know who the Correspondents are in your district?—I know one, but I do not think there is one for Berkeley. I do not see the use there is in it. I hear there is a new leaflet issued by the Board of Agriculture on the American gooseberry blight, which I think will prove most valuable.

9883. (*By Lord Barnard.*) How do you get the leaflets?—From the Board of Agriculture, sent to the Secretary of our Society.

9884. Do you ever communicate with the Board of Agriculture, or give them information which would be of national value to farmers?—I cannot say that I have.

9885. Do not you think it would be of advantage if leading men all over the country were brought more into touch with the collegiate centres, so that knowledge could be collated, and districts should not be locked up in water-tight compartments, as it were, with a sort of idea—"Never mind what is done in the next parish, we will look after ourselves"?—I should think the correspondence would be so voluminous that it would never be looked at—I mean, it would never reach the farmer.

9886. I am afraid you have misunderstood me. My suggestion was that the correspondence should go to the Board of Agriculture?—Then I quite misunderstood your question.

9887. And that they should adopt such methods as they thought proper for disseminating the information as they do the leaflets. I do not suppose you would suggest that the leaflets are useless?—Certainly not, they give a good deal of information, and the new information that has been issued lately as regards the American gooseberry blight, will prove very valuable. I have asked our horticultural expert about the blight, but he says he has never come across it.

9888. (*By Lord Moreton.*) Is not the very object of those leaflets to warn people what to look out for?—Yes.

9889. I thought that was the most useful leaflet the Board of Agriculture have issued for a very long time in warning people to look out for it?—We do not know what it is. I was asking the expert, and he says that he has made every enquiry, but he has never been able to discover it.

The Rev. JOHN B. M'CLELLAN, M.A., called and examined.

Rev. J. B.
M'Clellan

9890. (*By Lord Barnard.*) You are Principal of the Royal Agricultural College, Cirencester?—Yes.

9891. You have held that appointment since when?—Since 1880.

9892. You gave evidence before the Departmental Committee on Agricultural and Dairy Schools in 1888?—Yes.

9893. Would you like to refer this Committee to that evidence—have you looked at it at all lately?—No, I have not; I do not think I should care to do that, unless you wish it.

9894. I mean as to how far we could take it as holding good at the present day?—I can give you later and fuller evidence if you wish it.

9895. Very well. In what year was the College founded?—I may state, the first project for the College was in 1842, arising out of a movement set on foot by the Farmers' Club of Fairford and Cirencester. It was taken up afterwards more elaborately in 1844 by a meeting of subscribers at Cirencester, and a committee was then formed and authorised to apply for a charter of incorporation. What is very important, if I may say so, is that in the same year at the Royal Agricultural Society's meeting at Southampton, the scheme was expounded to the Royal Agricultural Society, and was warmly taken up by them, being advocated there by the Duke of Richmond and Gordon, by Prof. Buckland, and others, who were illustrious for their scientific attainments and exalted rank. In 1845 a deed of settlement was obtained and a Royal Charter of incorporation.

9896. What is the deed of settlement?—That is an indenture for settling the conditions of association.

9897. Who was that obtained from?—It was a deed executed by certain named parties for the purpose of establishing the College. (*Handing in copy.*)

9898. Certain money was raised by shares?—Yes; the sum of £24,000 was authorised, but of this only £20,600 was raised.

9899. That was subscribed by private individuals?—Yes.

9900. And a Royal Charter was obtained?—A Royal Charter was obtained in the same year. I should like to mention that under the deed of settlement interest was allowed at 4 per cent. on the shares, but, as a matter of fact, no interest was ever paid. From the first, although it might be called in one sense, I suppose, a private enterprise for a public object, it was really more in the nature of a public enterprise, and I may mention that among the first governors there were no less than 16 peers of the realm. The first shares were taken by his late Royal Highness the Prince Consort, and are at this moment held by H.M. King Edward, by transfer from the late Queen Victoria.

9901. I understand from you that it is not a private venture for profit?—No, certainly not; it has never been that.

9902. I do not know whether you are aware of the state of the law which allows certain institutions which are legally limited liability companies to be registered without the use of the word "limited," on the pledge that they make no private profit. Does this institution come under that clause of the Act?—I should say not; it has not been registered at all.

9903. Is it a limited liability company under the Companies Act?—No, I think not; that Act was later.

9904. What is the legal status?—Simply a corporation incorporated by Royal Charter. The College has never been called a limited liability company.

9905. Then it is not a limited liability company?—I should say not.

9906. (*By Lord Moreton.*) Is the liability limited?—Subject to legal opinion, I should say yes.

9907. (*By Lord Barnard.*) If you could put in a copy of this charter, of which you have spoken, it would settle the whole question?—Yes, I have it and other documents here. (*Handing documents.*)

9908. Perhaps you will kindly leave those with the Secretary?—Certainly.

9909. You use the expression "Debenture bonds" in your *precis*?—To explain this it is convenient to state that in 1848 liabilities had been incurred to the extent of £22,000 and odd on the buildings, and of £7,700 sunk on the farm; that gave, roughly, a liability of £30,000. The consequence was that in 1849 the first supplemental charter was applied for, and obtained, under which £30,000 was raised during 10 years by a mortgage under certain guarantees for 10 years.

9910. I really think, for our present purpose, it is not necessary to go very deeply into this question of the legal status. The origin of the College, perhaps, is not so necessary?—I was going on to say that, when the mortgage was called in, a further supplemental charter was obtained in 1870, under which the debenture bonds of £30,000 were raised to meet the said liability.

9911. Perhaps you would tell us about these debenture bonds?—£30,000 was raised under that charter in debenture bonds of £100 each, to bear interest at 4 per cent., not more, and a new committee of management was formed at that time, composed of six representatives of the bond holders and four representatives of the old shareholders. That is the position at the present time; but, if I may add, £11,600 worth of the bonds have been paid off out of income and £6,400 have been surrendered.

9912. In other words, those have been given to the College?—Yes, and at present, therefore, there are only outstanding £12,000 debentures.

9913. Will you tell us what the original curriculum was?—The original curriculum as given in the Bye-laws and Regulations was as follows:—Chemistry, geology, natural history, botany, veterinary art, accounts, mathematics, natural philosophy, and practical engineering.

9914. You subsequently developed that?—We subsequently developed that. I can give you the dates of the various developments.

9914A. I do not think we need go through the dates. We want to know very briefly how you extended your sphere of operations?—During my predecessor's time there was, as far as I can trace any record, some progress made with a veterinary hospital. In my own time, since 1881, estate management has been added, economic entomology has been added, with a laboratory, and in 1885 a dairy with all its equipment, bacteriology in 1901, poultry in 1903, and then specially, and most important of all, the development of forestry came in 1903; Lord Bathurst offering a portion of his park for a forest garden, for which the *Forest Garden Guide* has lately been drawn up by Professor F. C. McClellan, and is in your hands. I may mention in regard to that, that in 1885 Colonel Pearson, who was the head of the Forestry Department in India, when he visited Cirencester said it was most important that a chair of forestry should be instituted at Cirencester because of its many advantages.

9915. You have been good enough to give us a prospectus, and I suppose that will practically inform the Committee of the work that has been done up to the present day and the curriculum and the subjects taught?—Yes, and also as to the various buildings and equipments.

9916. Are all your students resident, or are some non-resident?—Some are resident in the College, who are called in-students, and some are resident in the town, out of the College; they are called out-students.

9917. For how many students have you accommodation in the College?—We have accommodation for about 65 in-students, and as to out-students, I dare say we could take 40.

9918. What control have you over the out-students? Do they go where they like, or do you provide them with lodgings?—They reside in licensed lodgings, practically

the same as at Oxford and Cambridge, and are under particular regulations.

9919. Is there any difference in the cost between the in-students and the out-students?—As far as the payments to the College are concerned, the in-students, if they have no private rooms, pay £135 a year. That includes instruction, board and lodging. The out-students pay for their instruction alone—£75 a year.

9920. The number of students you have at present will be of interest?—At the end of 1906 there were 70. I have furnished the Committee with a schedule of the numbers from 1879 to the present date.

9921. Yes. You generally have, I see, about 70?—Yes. But the number increased every year from 1880 until we obtained the record number of 106 in 1885. From that time they have declined; no doubt owing to the competition of the State-aided colleges.

9922. The decline is still continuing?—The decline is still continuing.

9923. You seem to have got a slight increase of out-students?—Yes, practically.

9924. Are you acquainted with the number of students at all at the other collegiate centres?—No, except at Wye; but I should add that the numbers this term show a further decline, so that if I am allowed to speak later and make a few suggestions, I should like to call attention to the precarious position in which the College is now placed.

9925. Have you a limit of age at which the students should come to the College?—17.

9926. Not under 17?—Not under 17.

9927. Have you any limit at the other end?—No, we have had one out-student as old as 65.

9928. What is the usual age?—The usual age for inside students is 18, and for outside students about 21 to 26.

9929. Where have these students usually been?—At the large public schools, and the out-students, several of them, from the University after having taken their degrees.

9930. Do they come straight from schools, or have any of these students been in other professions first?—Some of the out-students have been at the bar, medicine, holy orders, and various professions. Some have been in the army and some have been in the navy.

9931. What class of men are they principally taken from?—From the landed gentry, the learned professions, the army and navy, commercial men, and so forth.

9932. The upper classes rather?—Yes.

9933. In fact, they must be, on account of the fee charged?—That is so. We have some occasionally, and have had some occasionally, from the wealthier farmers' families.

9934. What is the course; how long do you calculate a lad ought to stay at the College?—To complete the teaching course, two years; and to complete the examination course, two years and a third, or two years and two-thirds.

9935. What do you call the examination course?—After the general teaching is completed—the students who are going in for the diploma revise their work and prepare for their final examination.

9936. You have not told us what the diplomas are, or whether the College awards a diploma?—Under the Charter it is authorised to grant diplomas.

9937. The students who wish to go in for the diploma have to go through an examination?—A special examination, conducted mainly by external examiners.

9938. I suppose you keep in touch with your old students—you have an old students' club?—Yes, we have an old students' club, numbering about 200 members.

9939. They do not all join it if that is the membership?—No, they do not all join it.

9940. Have you any other means of keeping in touch with your old students?—Only the athletic matches, correspondence, and also the *Students' Gazette*. Articles are contributed from different parts of the world by old students to the *Students' Gazette*.

9941. Are you able to give the Committee any information as to what these students do after they

*Rev. J. B.
McClellan.*

20 June, 1907

Rev. J. B.
McClellan.

20 June, 1907

leave the College; what positions in life do they take up?—I can give you some particulars.

9942. Not of individuals?—No. I will not mention individuals. I do not know whether you want the number of students we have had.

9943. No, a general indication of what is the future career of the men you have turned out at the College?—A large number of them have become estate agents; some have immediately taken farms and done exceedingly well; a number have become heads of colleges and directors of agriculture in various parts of the world—I think I might mention one by name now, Mollison, head of the Agricultural Department in India. Some, I am happy to say, have become connected with the Board of Agriculture, and one you have close to you, a very distinguished old student. Another one has been private secretary to two Presidents of the Board of Agriculture. He is now Secretary of the Surveyors' Institution. Some have become principals of colleges in Australia, in New Zealand, in the Cape of Good Hope, in the Mauritius, and in India five or six of them, and others have held distinguished positions, public and private, as in the Soudan and in different parts of the world.

9944. Are any of them distinguished at either of these places that you see marked in red on that map?—Druce was at Holmes Chapel, Thonger was at Hollesley, and Muir was at Leeds.

9945. Are your students drawn from all parts of the British Empire, or are they local men?—From all parts of the British Isles and all parts of the world: we have had numbers of natives sent by the Indian Governments, and also several of the Indian Civil Servants, as Ozanne, Steadman, Allen, and Muir Mackenzie, who is a distinguished Civil Servant in India at the present time.

9946. I have not asked you about your buildings, because they are fully described in your book here. I take it it is all freehold property belonging to the College?—No, it is held under Lord Bathurst. I can give you the particulars as to the leases, if you like.

9947. What the Committee ought to know is what are the terms of your holding. Is it under a lease?—Yes.

9948. Do you know the date of that lease?—The original lease was granted in 1848, to date as from 1845.

9949. For how many years?—For 99 years for the College and 47 years for the farm.

9950. It must have been renewed since then?—The tenancy, yes, but not the lease.

9951. For what period?—The tenancy is now an annual one.

9952. I dare say the Committee may assume that, as Lord Bathurst was good enough to help you, the conditions of the lease are not onerous?—No, not at all.

9953. Is it a substantial rent or a nominal rent that you pay?—Our present rent is £220 a year, that is for the portion held by the College. I ought to explain that in 1865 the lease of the farm was surrendered to Lord Bathurst, but under covenants that the College should have the perfect right as before of entry for the practical instruction. That is explained in the prospectus.

9954. The College have a covenant from Lord Bathurst not to let the farm without a right of entry for the College students?—Yes; not to let, except subject to those conditions of the right of the use of the farm by the College for practical instruction.

9955. What is the size of the farm?—450 acres, partly arable, partly pasture.

9956. About half-and-half is it?—The pasture is exactly 202 acres.

9957. What rent is paid for the farm?—The tenant pays £450.

9958. Do you have anything to pay for the use of the farm?—Yes, we pay a capitation fee to the tenant of the farm of £3 a year for every student.

9959. How frequently does each student go on to the farm?—Every student has a class on the farm with a Professor once a week, sometimes twice; independently of his own private work.

9960. How long is he there each time?—An hour with the Professor.

9961. (By Lord Moreton.) Apart from the classes is there anything to prevent students going on the farm by themselves?—No, it is part of their right to go

on the farm and observe and take part in any operation for which they may be qualified at any time of the day, and on any day of the week, and my instruction to them also is that they are expected to occupy a part of their leisure hours on the farm. I am bound to say a great number of them do not do it, but they are exhorted to do it, and to take part in the manual labour and processes which go on, as e.g., in sheep shearing, in ploughing, in scythe mowing, root and hay harvesting, and in all the other operations, but a great number of them do object to take any part in manual labour.

9962. (By Lord Barnard.) Does that arise from a mere disinclination to work, or from a feeling that it is derogatory?—I think partly because they are of opinion that manual labour will not be of very much use to them, and partly because they are rather disposed to occupy their time in recreation after their class work.

9963. (By Lord Moreton.) We may take it, apart from the scientific instruction imparted by the College professors, that the students have every opportunity of seeing the farm operations and taking a practical part in them?—Certainly.

9964. And prizes are given for it?—Yes.

9965. You lay stress on the word "practical"?—Yes.

9966. (By Mr. Medd.) Some of the students largely take advantage of those facilities?—They do.

9967. You retain a certain portion of the farm in your own hands?—Yes, about 40 acres.

9968. So that they are not entirely cut off from the practical side?—No, not even so; but the 450 acres of the farm is the chief field for the practical side of the out-door instruction.

9969. (By Lord Barnard.) Is the 40 acres you retain partly pasture and partly arable?—It is partly pasture and partly arable; there are only six acres arable, and the rest is pasture in connection with the dairy.

9970. Where exactly is the College situated—is it in the town?—It is about a mile and a half from the town.

9971. Is Cirencester a market town?—It is a market town.

9972. In the centre of a large district?—Yes, a very important district; it has a very important corn market and cattle market, and it has also a Chamber of Agriculture.

9973. Do your students attend the markets?—Yes, very regularly, and they are, by courtesy, admitted free to the Chamber of Agriculture.

9974. (By Lord Moreton.) It is one of the most important markets in the county of Gloucester, is it not?—It is, and the students attend it very regularly.

9975. (By Mr. Latham.) With regard to this practical agriculture, I think I am fair in asking you the question whether it would not be better if they would take a little more interest in the farm?—I think so, too; but I will tell you a story, if it is not taking up the time too much, on that subject, with regard to an Indian student who went down to the veterinary class. He was asked to do something to a horse and its shoes, and he said, "I have not come 10,000 miles to take part in the blacking of the back boots of a horse." I think that is the feeling of many of them. They are taught the use and the nature of every operation and of every machine, and when it comes to the final examination for the diploma, they are examined by external examiners in every part of that work, taken on to the farm and through every operation, both in the dairy and in the farm, and they cannot get their diploma unless they have successfully passed that examination. But I thoroughly agree with you, and I have often urged it, that they should take more interest in the manual work than many of them do.

9976. (By Lord Barnard.) Do you go in for poultry at all?—Yes; that was one of the developments which I inaugurated in 1903.

9977. Have you a poultry teacher?—Yes, a visiting teacher, one of the Browns, of Theale Farm, Reading; and there is an excellent model poultry farm in the town, run by one of our old students, where our practical demonstrations take place.

9978. Then, as to dairy work, perhaps you will tell the Committee something about that?—The dairy was established in 1885, with dairy-manager's house, steading for cows, and piggeries. It is extremely well equipped for every operation of dairy work, natural and mechanical

cream raising, butter making, and cheese making in all its branches.

9979. Does every student go through a course of dairy work?—Every student, yes.

9980. You mentioned at the commencement of your evidence a veterinary hospital?—I am glad you have mentioned the subject. The veterinary hospital goes on still, and the veterinary instructor takes his pupils there every day, one class or another, and we have animals brought for post-mortem examinations every term, as well as occasionally live patients for treatment.

9981. The students have a somewhat extended instruction in veterinary science?—Yes. May I mention that the late Sir George Brown, who was head of the Veterinary College until he died, was our veterinary examiner for the diploma, and he once reported to me, "Your students have not only done extremely well, but have passed a better examination than any of the students this year at the Royal Veterinary College."

9982. (*By Mr. Latham.*) Has there been any feeling on the part of the veterinary profession that you have gone a little further than you ought to have gone in your veterinary instruction?—Only on one occasion, when we put an advertisement in the local paper to receive patients for the hospital.

9983. (*By Lord Barnard.*) Will you tell us whether you have any special qualifications in agricultural subjects, or whether you are a pure science man yourself?—I have no special qualifications in agriculture myself; that and the various other subjects are taken by the different experts.

9984. What is your own special line?—My own special line, as far as the present College is concerned, is mathematics and physics.

9985. Then you have a professor of agriculture and dairy farming?—Yes.

9986. Is he a resident professor?—He is resident in the town.

9987. In addition to that, there is a dairy manager and demonstrator?—Yes, resident on the premises.

9988. Then you have a professor of estate management and forestry?—Yes.

9989. To go back again for one moment to the professor of agriculture and dairy farming, how does he acquire the title of professor?—The professors have their titles under the Charter; they have been called professors from the beginning.

9990. (*By Mr. Latham.*) What has Mr. Blundell done to gain the title of professor?—He was selected from various candidates when the post was vacant. He is an experienced practical farmer, and on more than one occasion has been appointed by the Royal Agricultural Society to examine for its diploma. You had one of our late professors here yesterday, Mr. McCracken; Professor Blundell succeeded him, as Mr. McCracken succeeded Mr. Robert Wallace, now Professor at Edinburgh University.

9991. (*By Lord Barnard.*) Then you have a professor of chemistry with an assistant; one in land surveying; one in book-keeping; one in physics and applied mechanics; one in botany, geology and zoology; one in veterinary surgery and bacteriology; a lecturer in poultry farming, and a professor in drawing?—Yes.

9992. Is your staff sufficient?—It is sufficient for our present work, but not sufficient if we are to do what we ought to do outside; that of course is a question of finance.

9993. You do some experimental work, do you?—We do and have done.

9994. For the use of your own students?—For the use of our own students, but the records especially referring to the manurial experiments on grasses, of which you have a return before you, are published in the *Students' Gazette*, and are circulated by that means throughout the country.

9995. You are not officially in touch with the Board of Agriculture at all, are you?—Not at all. I am sorry to say we are not.

9996. You do not often receive the Board of Agriculture leaflets?—Yes we do, and we receive the *Board of Agriculture Journal*, but that is by courtesy of the Board.

9997. Do you ever give information to the Board or ever correspond with any department of the Board?—Our Professor of Agriculture was invited to be one of the

Correspondents, but whether he has done much in that way I cannot say.

9998. You have 40 acres of land in your own hands. I suppose that is where you have your experimental plots?—Yes.

9999. They take the nature of experiments with different manures?—Yes, we have 20 half-acre plots for the grasses; they have been carried on since 1886. We have also had root and corn experiments.

10000. Do the students carry out any analysis of soils?—Yes, in the chemical laboratory, all students must do so for their diploma, and also even if they are not going in for the diploma, if taking the subject of chemistry.

10001. Part of the 40 acres is developed as a botanical garden?—Yes, 1½ acres.

10002. Part is devoted to forestry?—Yes, a small portion of our present grounds; but our chief forestry nursery is on another piece of ground hired specially for the purpose, and the forest garden is given by Lord Bathurst, in his own park.

10003. You plant the forest garden?—Yes, and the nursery we use partly for experiment, root pruning, and so forth.

10004. Are accurate measurements recorded of the growth of trees?—Yes, most accurate. Of course, the work has only been begun three years. As soon as the Report of the Departmental Committee on Forestry appeared, the College was the first to respond, and appointed a Professor of Forestry for the first time: Lord Bathurst at once gave up a portion of his park for the forest garden, and the Professor instituted and carried out and planted the whole of that garden, as you now see it portrayed in his book, with the measurements.

10005. One of the most important points with regard to forestry is to ascertain the rate of development of trees, measurements, and so on?—Yes.

10006. (*By Mr. Medd.*) Is it not the fact that the proximity of Cirencester to Oxford was one of the main reasons why the school of forestry was established at Oxford rather than at Cambridge?—I believe so.

10007. That appears in the evidence given by Dr. Schlich before the Departmental Committee on Forestry. —I might mention that Cirencester is especially favourably situated with regard to forest, being in close proximity to Lord Bathurst's woods, which have been said to possess some of the best beech and larch in Europe. There are also mixed woods, oak, ash, and Scotch pine and sycamore, &c. It is also within comparatively easy reach of Colesbourne, Postworth, Berkeley, Longleat, the Forest of Dean and Savernake and others, so that it has exceptional facilities for forestry.

10008. (*By Lord Moreton.*) In your opinion the students have unusually good facilities for studying old woods as well as the ordinary young stuff that is being produced in the nursery gardens?—I should say so. I do not know any part of England where they have so many combined facilities.

10009. I have no doubt you will agree with me that Lord Bathurst's woods have had, unlike a great many other woods, the advantage of being looked after for a great number of years by an expert in forestry?—Yes; they are exceedingly well-managed.

10010. (*By Lord Barnard.*) I suppose you would admit that the standard of forestry in this country is terribly low?—Yes.

10011. And that there is enormous scope for improvement in that direction?—Yes. Professor Schlich, giving us lectures some time ago, laid great stress upon that.

10012. You are trying now to raise the standard?—Yes.

10013. By giving your students increased technical knowledge and less rule-of-thumb knowledge?—Yes.

10014. You have great facilities for giving that?—Great facilities.

10015. Is there much planting going on in the district?—At Colesbourne there is planting going on on a large scale.

10016. I do not know whether you are aware of the very great dearth of instructors in forestry at the present moment?—Certainly.

10017. I am connected with a college in the North

Rev. J. B.
McClellan.

20 June, 1907

Rev. J. B.
McClellan.
20 June, 1907

of England, where we have a forestry instructor. The first man was tempted away to Ireland before we had him two years, and we have now got another man. I should think there must be a great opening for trained forestry instructors?—I should think so.

10018. I suppose you would recognise that a forestry instructor would be no good unless he had a practical knowledge of woods?—Certainly. We had some difficulty in appointing a successor to our previous Professor, who had a sound practical knowledge.

10019. The botanic garden is a feature in your instruction?—Yes, that is a very important feature in the instruction. It is one-and-a-quarter acres in extent, and there are no less than 67 beds of grasses, both good and bad; it has 52 beds for economic plants, and 48 beds for the natural orders, and the students under the professor of botany have their practical classes there every week. The matter of the grasses is an exceedingly important feature for agricultural education.

10020. Are there any questions that occur to you which I have not asked you generally on the present condition of your buildings, equipment, facilities, and so on?—No, I think you have gone through everything.

10021. There is just one subject you have not told us of, that is, the system of administration; in whom is the management vested?—At the present time under the supplemental charter of 1870, which is the one now existing, the government is vested in 10 members of a committee of management; six of those are elected to represent the bond holders, and four to represent the old shareholders.

10022. There are no representatives at present of any outside bodies?—At present, none.

10023. Assuming that the central body in London, the Government or the local authorities could be induced to give you any financial assistance, you would not object, would you, to their being represented on the board of management?—No, we should welcome them. I think I am quite justified in stating that on behalf of the Committee.

10024. How often do the Committee meet?—The present committee of management meet once a year; there are special committees at other times.

10025. That is a long interval. Do you carry on the management of the institution entirely?—Practically so, under the Bye-laws; but I am in constant communication with the chairman on every important point that arises, and I think I may say that the chairman is in communication with his colleagues more frequently than I know.

10026. Have you a clerk who conducts the correspondence?—I conduct it myself.

10027. Who keeps the accounts?—A clerk keeps the accounts, the Secretary prepares them for audit, and they are audited every year by three auditors.

10028. Professional auditors or amateurs?—Not strictly professional auditors, but still they are experienced business men.

10029. Do you teach book-keeping?—At the College?

10030. Yes.—Certainly, one of the best systems.

10031. Specially applicable to farming?—It is the double entry system, but there are also, in addition, farm journals kept.

10031A. Because it strikes me that the two classes of men whom you profess to educate, the land agent and the practical farmer, would require different instruction in book-keeping, although no doubt it would be as well in each case that the one should know something of the book-keeping of the other?—I think it is essential that both classes should learn the principles of double entry, but the farmer should have special books for the farm work, although, unless he understands the principles of double entry, I do not think he will ever keep accounts in a satisfactory way. If he does understand the principles of double entry, he may keep accounts for every particular field.

10032. We have had a good deal of evidence on the subject of farmers' book-keeping?—No doubt, and of estate agents, also, I suppose.

10033. No, we have principally considered it from a farmer's point of view, and probably such an elaborate system as you teach would be of very little use to a man who had been educated at an elementary school?—Our system would be easily comprehended.

10034. Do you think a man who has been trained at your college, and who becomes a land agent, is sufficiently instructed in book-keeping to be able to say to a tenant, on an estate of which he was agent, "Now, I will show you how to keep your books"?—Yes, we have several old students who are estate agents now who do that with their farmers.

10035. You think your students are sufficiently trained in the principles of the thing to make it clear to those they may be brought in contact with?—Yes, I am quite satisfied that they are.

10036. (By Mr. Medd.) It is desirable that the equipment should, if possible, be improved, internally, is it not?—For our present purposes, I should have thought not.

10037. I should have thought the museum, for example, might have been improved?—We have improved it of late years, and for our present purposes I think it is sufficient; it is very largely furnished for every department, agriculture, veterinary, chemistry, and geology, and the rest.

10038. I should have thought it would have been a very good ground for urging that additional public aid should be given, comparing the equipment of the rest of the College with corresponding colleges?—I am surprised to hear that; but if we extended, as I have wished to extend our work, in various directions, of course then we should develop the equipment of our museum, and ought to do so.

10039. (By Lord Barnard.) Before I pass away from the College, my eye has caught this interesting table which you have put before us, on the experiments with grass land. I have already asked you some questions on the subject, and I gather from you that the information contained here was practically only for the information of your own students?—It is hoped it will be of use to the public, because it is published in our *Students' Gazette*, which has a very wide circulation. It is always sent to the editors of agricultural papers, and they generally make large extracts from the reports every year, so that the public really get the full benefit of the records.

10040. (By Mr. Latham.) Are these records published in detail exactly as you have given them to us?—Yes, year by year, in the *Students' Gazette*.

10041. Have the public a good opportunity of knowing exactly the result of these several experiments as published by you in public papers?—They have, in this way: they are published in the August number of the *Students' Gazette*, which appears every term, and that number is not only sent to the Board of Agriculture, but also to every important agricultural newspaper, and the returns are generally copied out in some other papers.

10042. (By Lord Barnard.) To take, for example, the College with which I am associated in Newcastle; this is not sent there, is it?—No, it is not sent to the various colleges.

10043. Do not you think it is possible that such information might be useful to the scientific men at all these places for the purpose of comparing them with their own experiments?—I have no doubt it would be.

10044. It would either confirm or throw doubt upon the results of their own experiments?—Certainly.

10045. In the same way, do not you think it very desirable that you should be in possession of the results of the experiments carried on by the other colleges?—Yes, I think an interchange of results is very desirable.

10046. I should suggest that public money should only be given on condition that such information was made public property for the benefit of the public at large?—Certainly. Conditions would be laid down, naturally. You see, we have been working entirely without assistance up to the present.

10047. Yes. Now we pass on to the financial position of the College. Does the income which you receive at the present day meet the expenditure?—No, it does not, and it has not done so for several years.

10048. From what source does the balance come?—From private sources; amounts to about £15,000 have come from private sources; £7,000 from one private source alone.

10049. Do you think that is satisfactory?—Certainly not.

10050. Would it be possible to increase your income in any way?—Our income is entirely dependent upon

Rev. J. B.
McClellan,
20 June, 1907

fees, and when we consider the lower fees that can be charged by colleges which are receiving State and County Council assistance, it is impossible for us to consider our position otherwise than most precarious. I have proposed to our Chairman a question whether we can afford to reduce our fees, and he says, certainly not, we cannot afford to reduce them. It is also certain that without assistance we cannot go on very much longer. I think I may put it that way.

10051. Have the fees increased from what they were originally?—Yes, they have been very much increased from what they were originally.

10052. Then the cost of instruction, I suppose, and other expenses, have also increased?—The cost of instruction has increased, and the cost of living and other expenses have increased.

10053. (By Mr. Latham.) What was this payment of £45 per term originally?—The original payment in 1845, when the charter was granted, was what I may call the ridiculously low sum of £30 a year. Perhaps I may be allowed to repeat that the College had got into very heavy debt three years afterwards, so the fee was raised from £30 to £80, since when it was raised in my predecessor's time to £125, and in my own time to £135, where it stands at present.

10054. (By Mr. Medd.) Have you not found within the last few years that similar institutions in receipt of State and local aid have been able to attract pupils who would otherwise have come to you and are quite capable really of paying the high fees charged by you?—Certainly; cases have been mentioned to me and cases have gone from our College, because they could get a somewhat similar education elsewhere at much lower fees.

10055. Then it comes to this, that a certain portion of this public money is being utilised for the purpose of educating the sons of men who could well afford to pay for themselves?—Undoubtedly.

10056. (By Mr. Latham.) You have never made any attempt to have two classes of fees?—No.

10057. (By Lord Barnard.) You told us that you personally conduct most of the correspondence; I suppose that includes correspondence with prospective students?—Yes.

10058. Then you may have some experience on the point that I am going to ask you. Is it your opinion that at the present time, in consequence of the competition of these other places to which you have referred, and perhaps for other reasons, that the number of students is steadily decreasing, and is it your anticipation that that will probably continue to decrease?—My answer to that is in the affirmative in both cases.

10059. You have no endowment?—We have no endowments whatever; we have conducted the College throughout our whole period of 65 years without any endowment.

10060. (By Lord Moreton.) I suppose now that of the class that the College might expect to draw the pupils from in the future, as they have done in the past, many of them will possibly prefer to go to the State-aided University of Cambridge?—There is that possibility.

10061. Apart from all these other red spots on the map?—Yes, quite so. Of course up till now we have regularly had students, and at the present moment we have students, who have taken their degree at Cambridge and have come to us, just as we have students at the present moment who have taken their degree at Oxford and have come to us; but unless we get some assistance, and are able to reduce our fees, they may go elsewhere.

10062. (By Lord Barnard.) Are your accounts published at all?—The accounts are submitted every year to the Court of Shareholders, and a copy is sent to the Board of Trade every year.

10063. Why on earth is that done?—It is so ordered by the first charter, and is required by the Board.

10064. Are you personally acquainted with all the circumstances about the bonds?—I think so.

10065. You have a solicitor, I daresay?—Yes.

10066. The reason I mention the subject is because you have put it down?—Yes; the bonds —

10067. Will you tell us what you were going to say about the bonds?—The bonds were issued, as I have previously stated, in 1870 for £30,000; of these, £11,600 have been paid off: £6,400 have been voluntarily surrendered as a benefaction to the College; and £12,000 remain, bearing interest at 4 per cent. They are not allowed to bear higher interest.

10068. Has the board of management ever taken stock of late years of their financial position? Have they ever taken expert advice on the subject from a valuer and an accountant?—No, I believe not; but there is valuation of live and dead stock every year, and an old valuation of furniture, &c., brought forward annually with corrections for depreciation.

10069. Are the buildings kept up in good order?—Very good order. We have an architect belonging to the College—at least, practically on the College staff.

10070. Do you keep tradesmen on your staff; have you a joiner and a plumber and a painter, and so on?—No, we employ tradesmen from the town, except in the case of those who are specially engaged for the instruction of students in practical carpentry, forge and smith work, and so on.

10071. (By Mr. Medd.) The actual condition of the buildings is excellent?—I think so; good, at any rate.

10072. I made the remark to you the last time I was there, what a pity it would be if anything occurred to prevent the continuance of the College?—You did.

10073. (By Lord Moreton.) At the same time I am right in saying the buildings are not so young as they once were, and as time goes on there may be very serious expense hanging over the College as regards repairs, which would be a very heavy tax on it with its present unaided finances?—Would you say a serious one? Of course there must be a more or less serious one. Only last year chimney stacks needed to be put in thoroughly good repair—rebuilt, in fact; the roofs have been looked to from time to time, and are in fair repair.

10074. (By Lord Barnard.) To conclude this portion of the subject, what is your opinion as to the present financial position, as far as you are acquainted with it?—The present financial position is extremely precarious. It can scarcely, I think, be expected that the committee of management, notwithstanding their public spirit, can carry on a college from year to year at a loss; therefore, without financial assistance, sooner or later, the College will necessarily be closed; that is my opinion.

10075. Have you ever approached the Board of Agriculture, or the Treasury, or any other Government department, to be recognised as a Government institution?—We have done so indirectly, but they have never seen their way to assist us without certain changes, which at the time were not considered practicable by the committee; but at the present moment the committee of management are thoroughly prepared to welcome proposals which may be made by the Board of Agriculture in regard to, shall I say, a reconstruction of the College, if necessary.

10076. By a reconstruction of the College you do not mean of the buildings—you mean of the management?—Yes, the management—the constitution.

10077. Perhaps you will explain the position with regard to that?—I think what I may call *pourparlers* have gone on—that is the best way to put it—but one difficulty has been the fact that the suggested changes in the management have been thought too fundamental; and another, that the bondholders are entitled under the charter to 4 per cent. interest on their bonds. I think those have been the two difficulties; but there has been no definite application till quite recently as to whether the Board could see fit to gather together representatives of counties, to ascertain whether such counties could, with the assistance of the Board of Agriculture, come into co-operation with the College authorities.

10078. You told us that a great many of those bonds had been paid off?—Yes, £11,600; £1,900 was paid off in 1885 alone.

10079. Were they paid off with profits made out of the College at the time?—Yes.

10080. So that there was a day when the College was making a profit?—Certainly; during several years bonds were paid off out of profit.

10081. I wonder if you will agree with the suggestion from me to this effect, that, admitting the College had at one time fulfilled an extremely useful function in agricultural education, and had a great measure of success, owing probably to the altered circumstances of the present day it has now ceased to fulfil those functions, and possibly there is no possibility of its ever fulfilling them again to the same extent, and in the same way on the present footing?—I do not think

Rev. J. B.
M^cClellan.
20 June, 1907

there is a difficulty in fulfilling the functions, but there is a great difficulty in obtaining the finance.

10082. (*By Lord Moreton.*) May I ask whether the changed conditions at the present day are not owing to the State-aid that has been given to rival institutions?—That is the point I mentioned before.

10083. Yes, but I want you to bring it out in extra strong colours?—Yes, emphatically so.

10084. (*By Mr. Medd.*) You would now be prepared to submit to State inspection, to have a representative governing body, to act as a collegiate centre for Gloucester, or a group of counties to be affiliated to a university department if one is established, as we hope, at Oxford?—Certainly; in all those respects I would say yes.

10085. I may say we had evidence here the other day from the Vice-Chancellor of Oxford, who spoke very anxiously about carrying out that project, and also from Professor Lloyd Morgan of the University College of Bristol, and in everything Professor Morgan said he expressed his utmost anxiety to co-operate with Cirencester that no step would be taken by his College at any time to injure Cirencester, but that he should look upon you as an essential adjunct to them, and possibly one or two of your chief students might go to him for the purposes of research. That is a view which probably recommends itself to you?—Certainly. I have a paper here—I do not know whether it is more or less a private paper, but I do not think the governing body of the College would have any objection to me passing it into the hands of the Committee—which gives reasons specially for the decline in the number of students. (*Handing document.*)

10086. (*By Lord Barnard.*) Do you think if your College were recognised as a public institution it might in time receive benefactions from various persons—what are technically known as charities?—It is difficult for me to say that.

10087. Are you not aware that a gentleman in Shropshire recently left £26,000 towards a College there?—That has always been my hope for our own College of Cirencester, but I am afraid that I have never expected it.

10088. Why not, when it has already occurred in an adjoining county?—I can only say I am afraid I have not expected it.

10089. Has it not been the habit from time immemorial for donors to found charities from a few shillings up to thousands of pounds for educational purposes?—I am talking of what are known technically as charities with permanent endowments?—We have never had that good fortune.

10090. No, but I can see no reason why something of the same kind should not happen in your case as has happened through all times in this country, that when an institution has proved its usefulness benefactors generally will endow it. You have not contemplated the possibility of such a thing?—I have hoped for it, but I cannot say that I have been expecting it.

10091. Do you not think there is a possibility of such a thing happening if the institution became recognised as a public institution—that public opinion would lead some generous-minded person to do in your case what has been done in the case of so many others?—If we were a public institution probably that might be so, and we are anxious to become a public institution.

10092. (*By Mr. Latham.*) Reading College could never have existed if it had not been for the endowments which it received?—No. Let us become a public institution. We want to become one now, but I think we want to become one by reconstruction and not by dissolution. I think it would be a great injustice—if I may be permitted to say that—to all the students who have passed through the College, of whom there have been no less than 3,500, if we were to dissolve, if it could be avoided.

10093. You have told us that the farm is an adjunct to the College; you have nothing to do with the farm yourself?—No, we do not manage it ourselves; it is under the management of a tenant.

10094. I see you have put down an expenditure of £820 for the purchase of live stock; what is that for?—That applies to expenditure on the 40 acres.

10095. Surely not?—Yes; but it is noted as the year's total expenditure on land, live stock, and dairy, not purchase of live stock only.

10096. It is a large amount to spend on 40 acres?—It would be so if it did not include the dairy and many other expenses.

10097. Is the dairy a loss to you, then?—Not at all; the amount in question includes sundry wages, dairy manager's salary, cattle foods, cost of purchased milk, &c., and, in addition, the purchase of live stock. [*The Witness subsequently sent to the Committee a full analysis shewing in detail how this sum was expended.*]

10098. (*By Lord Barnard.*) Is it your opinion that, unless some step is taken, the institution will be in danger of coming to an end?—Yes, that is my opinion.

10099. Is it your further opinion that such an end would be a misfortune from a public point of view?—I think so decidedly.

10100. A means of affording agricultural instruction would be lost to the public?—Yes, I think so. The Board has got no institution in this part of these counties. Of course, there is a great deal more work which ought to be done, and which we have been prevented from doing through not receiving assistance; for example, we might have made ourselves an experimental station for the benefit of the public; we might have had itinerant lectures, demonstration areas, vacation classes; all ought to be done, but we have been debarred by not having the money.

10101. The reason I did not ask you about those subjects is because practically that is the work the County Council carry on, and I do not suppose you would care to compete with them?—Quite so.

10102. I asked you some questions just now as to whether you had ever communicated with the central Government. Have you ever communicated with any of the local bodies?—Yes, recently we have.

10103. Did you get to *pourparlers* in that case?—Yes.

10104. Did you get beyond that?—No, I think not. The answer was that the moneys they already received for agricultural education had been already allocated.

10105. (*By Mr. Medd.*) When the public understand that you are prepared to co-operate with them in agricultural education, the local authorities, both of Gloucestershire, and possibly Wiltshire, and it might be of Worcestershire, are likely to assist to some extent?—I think it is likely.

10106. It is a proposal which has not been definitely before them, only problematically considered; and with regard to Gloucestershire, there is no reason why all the money expended on agricultural education in Gloucestershire should not pass through you as the channel of distribution?—I am very glad to hear that you think so.

10107. That has never been refused, for instance?—Not that I am aware of.

10108. If I may put it in this way. You have hitherto refused to render such facilities, for reasons which were good to you, which you might have rendered. Now that you are prepared to render them, the attitude of the local authority to you appears to be very different?—I understand so.

10109. (*By Mr. Latham.*) It would lessen the prestige, probably, of Cirencester if you were to allow it to be turned into one of those red spots, would it not?—I think it would raise our prestige if we had Government recognition, and, permit me to add, affiliation to a University, e.g., Oxford, as previously suggested by Mr. Medd.

10110. (*By Mr. Medd.*) You have already answered me that you would like to become a collegiate centre for a single or a group of counties?—Yes.

10111. You would like everyone in this Committee to see that that white area on the map was coloured in a manner corresponding to the rest of England?—Yes.

10112. By making Cirencester, with all its admirable equipment and prestige, a red collegiate centre for a group of counties?—Precisely so.

Mr. WALTER P. WRIGHT called and examined.

10113. (*By Lord Barnard.*) Would you kindly tell the Committee what is exactly the position you hold?—I am Horticultural Superintendent under the Kent County Council and Horticultural Instructor at the South-Eastern College at Wye—two separate appointments.

10114. Will you give the Committee some information as to the inception of horticultural education?—Shall I make a short statement as to that?

10115. You know the objects for which this Committee exists?—Quite.

10116. Anything that is material for us to report we shall be glad if you will tell us, but purely historical facts that are not useful for that purpose pray do not trouble to give.—Then I do not think it need be gone into. I will simply remind you about the "whisky money" given 18 years ago, and the county councils taking up educational work through the medium of a technical education committee. That is really all I need say on that particular point.

10117. I think we have a good deal of information about the "whisky money." About the year 1890 several county councils took over this work, and appointed instructors in horticulture?—Yes.

10118. They have been engaged since that date in doing that work?—Yes, my appointment under the Kent County Council did not begin till 1892; but I was doing a little work before then.

10119. What is your opinion of the work that has been done in the last 16 years?—Of course I am speaking of horticulture in particular; that is quite understood?

10120. Yes.—I think very valuable work indeed has been done in horticulture.

10121. Do your duties lie principally with cottagers, or do you undertake to teach more elaborate gardening?—With regard to my appointment under the Kent County Council it is more particularly with cottagers; I came into contact with other classes principally through my appointment on the staff at Wye.

10122. Has cottage gardening improved in Kent?—It has improved enormously.

10123. I mean from a commercial point of view, not from the point of view of the gardens looking prettier than they used to?—I cannot say that cottagers, as a class, have made any particular financial advance—in the way of becoming market gardeners.

10124. Have they better produce for their own consumption?—Yes, undoubtedly, and there are more flower shows, and more competitions; the whole thing has advanced enormously.

10125. It has an economic value?—To the cottager it is of considerable economic value, because it gives him a supply of good, cheap food.

10126. In former days, surely Kent cottagers were famous for their gardens?—I think they have always been more or less famous.

10127. You think they have made an advance even upon their original fame?—Yes, from my own observation I think they have made a very great advance. We started 11 years ago a series of garden competitions: these are quite different things from show competitions; at show competitions they simply exhibit produce, where they grow it is another matter, and they do not always grow it themselves. When the Kent County Council established these competitions they were made for gardens and allotments, and we fixed a scale of marks for the different vegetables, and for the system of cropping, and I have been able to estimate by the increase or decrease, as the case may be, in different districts, the result of the work, and there has been a steady advance.

10128. Do you go about lecturing?—I lecture in the winter, and at every place I lecture at in the winter I am enabled to offer the cottagers a competition during the following summer; every cottager who comes to the lecture in the winter is eligible to enter for this competition, and to have his garden judged in the summer. Our system has been taken up in many places, and I have been invited to judge in many other places.

10129. Do cottagers apply to you ever for information and assistance?—Yes, frequently; I am always having communications from them.

10130. You think they appreciate the services which the County Council supplies to them?—Very much indeed. If permitted, I could say a great deal on that, for really the horticultural work we have done in Kent has revolutionised public sentiment towards agricultural education. When lectures in the rural districts first began, it was with the University Extension lectures, given by extremely capable men, but the information was rather above the heads of the working people, and the thing was dwindling very much. The establishment of practical instruction and these competitions put it on an entirely different footing, and I am very glad to say the whole attitude of the people now is favourable towards agricultural instruction.

10131. You find that there has been a great change?—A great change; a complete reversal of public opinion in the county.

10132. And probably opinion is not completely formed even now?—It is still ripening.

10133. Fruit growing, and so on, is a considerable industry in Kent?—A very great industry.

10134. Does that come under your ken?—Yes; we include fruit growing in our syllabus; we give them a choice of sets of lectures on fruit and vegetables, and flowers.

10135. Do the small holders go in for orchards and fruit?—To some extent, but there is not a considerable demand for small holdings in Kent; there is no such movement in Kent for small holdings as there is in Lincolnshire, for example.

10136. I suppose hop growing requires large holdings?—A great deal of capital is invested in hop cultivation, and also in fruit, and the labourers get comparatively high wages, so that I do not think there is likely to be any strong demand for small holdings in Kent.

10137. Do you know whether there are any small holdings for hops?—Very few indeed, I think.

10138. (*By Mr. Latham.*) There are small holders that grow hops?—Probably only a few; there may be just a few cases, but they are very, very few; it is not at all the rule. It is a very speculative crop, and that debar people with small capital from growing hops.

10139. (*By Lord Barnard.*) Do hops come within your jurisdiction at all?—No, not at all; not in either capacity.

10140. Are there many elementary school gardens in Kent?—Yes, a considerable number.

10141. Are they increasing?—They are.

10142. Do the children take an interest in them?—A very considerable interest.

10143. Do you encourage their formation whenever you get the chance?—The county has encouraged them a good deal; but not in one particular direction—that is to say, owing to want of funds, they have not been able to give me charge of the whole of the elementary school gardens, and they are only inspected by H.M. inspectors under the Board of Education, and, naturally, I am not at all satisfied with that. I think a very important thing in connection with school gardens is to have them inspected by experts—practical men.

10144. Rather than by gentlemen who, I believe I am right in saying, are in many cases distinguished classmates of Oxford or Cambridge?—I certainly think that practical inspection should be given as well.

10145. (*By Mr. Latham.*) You mean you would rather have an inspector who was more such a man as yourself?—Yes, I am afraid so. I have felt in a little difficulty in pressing that point, because of my personal interest in it; I mean to say, it would be a certain source of additional income to me; but I think it is very important that they should be inspected by practical men.

10146. (*By Lord Barnard.*) Are there two administrative counties in Kent?—No, only one.

Mr. W. P.
Wright.

20 June, 1907

Mr. W. P.
Wright.

20 June, 1907

10147. You are speaking of the whole county?—Yes.

10148. Possibly you have not referred to the Report of the Board of Agriculture recently. That shows that there are a very large number of small holders in Kent of between 5 and 50 acres. (*Handing Report*)?—Thank you; I had not noticed the large number of small holdings. Probably many of these are men in the Sevenoaks district—strawberry growers, who grow partly for the bigger fruit growers and jam factories.

10149. Those were rather the men I was referring to, and they cultivate the land in the way you particularly deal with, namely, strawberries. Let us go back to the school gardens. Do you find an increasing interest taken in school gardens?—Yes, all over the county.

10150. Do you consider greater attention should be paid to that subject?—Yes, I think it should be carried on when the children leave school; much more should be done in that direction; it is not properly linked up; that is what I consider the chief defect.

10151. You mention in the *précis* of your evidence that you sent in to the Secretary of this Committee “the value of training in a private garden, inasmuch as it gives a grounding in practical work”?—Yes.

10152. I do not understand what your suggestion is in connection with that. Surely you do not suggest that everybody who is going to take up fruit growing should go through a course of training in a big private garden?—No. What I had in my mind was the future of the boys that we are dealing with in the school gardens. Many of those boys are the children of labourers, and a good many of them drift away after leaving school and we lose them; we do not follow them up beyond that point. That is where I think we have got a great deal of work to do, but that will come in the future.

10153. With regard to gardening for pecuniary advantage, whether it is only a cottage garden or whether it is a commercial garden, do you consider that scientific knowledge is of any or of great value?—Yes, I consider it is of very great importance.

10154. In the absence of scientific knowledge you state here that you think the work comes to be done merely by rote?—That is my principal point—unintelligently.

10155. So that if anything happens out of the ordinary course the gardener does not know what to do?—That is so, because he has not a general grasp of the principles which underlie the work.

10156. What is the result in the case of the man who does practical work only and nothing more?—He drifts into the rank and file of average gardeners whose wages are 25s. to 30s. a week, and he may become extremely egotistical and a trial to his master.

10157. Are many of the private gardens in Kent very large?—Yes, they certainly are considerable; it is a county with many private houses—almost a residential county.

10158. (*By Mr. Latham.*) Would not a gardener from one of these private gardens be equal to teaching these young men?—He could teach them as far as his own knowledge goes, but he has not any scientific knowledge as a rule. He could train them to follow his own footsteps as a private gardener, but the private gardening profession is very poorly paid.

10159. We have had evidence about a society in Berkshire of private gardeners, some of whom are almost at the top of the tree?—In what respect do you mean?

10160. There is an association not very far from where I live whose members are composed of these private gardeners in gentlemen's gardens, and they have meetings, and they are very intelligent, and it is very striking the way in which they try to teach each other?—These mutual associations amongst gardeners are excellent, but if you follow them through you will find there is not a great deal of experimental or research work touched upon; they are almost always working in the same groove. It is good as far as it goes, but I should like to see it go further.

10161. (*By Lord Barnard.*) You think it is desirable that the present system should be altered in that respect?—I think there ought to be an advance in it, because they keep to the same lines year after year. The average gardener of to-day is approximately what he was 50 years ago, and 50 years hence he may be just the same as he is to-day, unless something is done in the way of scientific education.

10162. If the market gardener has a somewhat poor

outlook in front of him, and we have gathered from some of the witnesses who have come here that he has not a very bright outlook, it seems doubtful whether scientific education would be taken up by him except as a luxury. If it is not a profitable employment I do not know that we could very well make a recommendation to the Government that a grant should be given?—Of course you have not asked me any questions yet with regard to the commercial side. So far as the private side is concerned, the wages of gardeners are low.

10163. Of course their wages do not represent the whole of their emoluments?—No, sometimes they have their cottages, their coal, and their vegetables, but I think there would be a tendency for the position of gardeners to improve if they were better educated men.

10164. If you have a man better educated he expects higher remuneration?—That is one of my points.

10165. You think people would be prepared to pay more if they had better educated men?—Yes; I think their gardens would be better controlled, and it would be true economy if they got superior men.

10166. Do you not think what you say of gardeners is true of domestic servants—that is to say, grooms, and butlers, and coachmen, and gamekeepers—they are all of them, in my experience, rather inclined to be unprogressive, and to do their work by rote?—Quite so.

10167. What I understand you to argue is that private gardeners earn very little, and the reason they do so is because they are not very progressive?—That is my point.

10168. My impression was rather that it was owing to the fact that when a man gets a berth in a private establishment he thinks he is comfortably off, and if the berth does not suit him, he will be able to get another that will, and he has no feeling of responsibility because he knows he has someone to provide for him, and he does not trouble to progress himself, and he will not bring up his boys to be any better than he is himself?—Is not that my own point—that they are an unprogressive class, because their education is in a certain groove, and they do not get beyond that groove?

10169. The only thing is I am not so hopeful as you are that you can improve the status of private gardeners. I rather doubt it, taking them as a class, because I think they lack the spur that the man who is working for his own living has, the measure of whose success lies in his own exertions, and in the exercise of his own brains?—I agree with you that with a man of a certain type of education that must be so, but it certainly seems to me that a man of a somewhat higher standard of education would be more progressive. I cannot imagine a man with a well-trained, scientific mind ever falling into that groove, and being content to remain in it.

10170. May I give you an instance—this is not of a gardener. I have a farm; I do not have to make my living out of it, but I think on my farm that I ought to have and do everything up-to-date, and ought to weigh the morning and evening milk, and that kind of thing, but, although I am constantly urging it, I cannot get it done, and I attribute it largely to the fact that my servants do not depend upon it for their living, like a man who is farming on his own account, and that applies also to my gardener and others. However, you wanted to say something on the other side, the subject of commercial gardening in Kent?—Yes, to begin with, it is a very considerable industry, as I daresay you know. There is a great deal of market-gardening conducted in the county, and more particularly in the neighbourhood of London, at Swanley, and Sidcup, and I think that should tend to increase.

10171. It is tending to increase, is it not?—It is growing.

10172. Do you give any instruction in fruit grading and packing?—Yes; at the College.

10173. We have been told by other witnesses that it is almost essential for persons who are going to sell fruit that they should be properly educated in grading and packing?—It is very important, indeed, that the packing of fruit should be better, and I am very glad to say that improvement is going on. As an instance of the fact that we really are moving, I may say that we had a fruit conference at Wye last November. I myself was lecturing on strawberries, and I exhibited a number of up-to-date packing appliances, and explained how they were used. We had an exhibition of them in one of the College laboratories, and I noticed that that

aroused almost more interest than anything else at the meeting, clearly showing that there is an interest in it, and that growers are alive to the fact that it is important. We have to move in two stages; the first stage is to teach them that there is something worth studying, and the second stage is to get them to study it.

10174. Do you think in the face of the growing competition from British Colonies and abroad, that fruit growing is really a profitable employment in this country?—I think so, provided we grow specially choice varieties, and put them on the market at times when the foreigners cannot compete very strongly with us.

10175. They also can put some good things on the market. I remember eating some of the best pears I ever ate from Cape Colony in March?—Yes, we cannot, I am afraid, compete with them after Christmas unless we can develop cold storage. Bearing on that, I may say that a few years ago the Kent Technical Education Committee conducted a series of experiments in cold storage at Dartford. One of the members of the Committee was a Mr. Hesketh, a partner in the firm of Hall & Sons, who do a very large business in fitting up the vessels that bring fruit from the Colonies. I had practically charge of these experiments. The Committee carried them on for several months, and issued a report, of which it printed a considerable number. During the whole of the time we had those experiments going on none of the fruit growers in Kent came to see what we were doing, and the number of applications for copies of the pamphlet that we published, giving our results, was, perhaps, a dozen from people in this country, but hundreds of applications came to us from the Colonies. No attention whatever was paid to the work, do what we would, in Kent; all the attention came from abroad. Letters of enquiry came from all parts of the world, except from our own county. The only interest I could see in the matter in Kent was when I was able to exhibit in October of one year a particular variety of perishable apple that we put into cold storage in the previous October; that did rouse them. That was at a fruit show at Maidstone. But when Mr. Hesketh discovered it was doing no particular good in Kent the thing was given up; no doubt it was costing him a good deal of money. That was six or seven years ago, and it shows the apathy there is on the part of the home growers, but we are trying to break that down.

10176. Can you suggest to the Committee any way in which public money could, with advantage, be utilised to improve the commercial position of these small growers. When I say with advantage, I mean as a matter of urgent public necessity?—I think a good deal could be done if we could establish some fruit stations in different parts of the counties, notably in Kent. I think that would be a great advantage. The position at present is this, that we have the college at Wye, which is down in East Kent, and a great many of the large market growers are in the London district, and as we have not got a very progressive railway company, it is quite a business to get them down there to see our work, and we can only do it on one or two special occasions in the year. I think that is rather an unfortunate state of affairs. Although Wye is always open to them, they only come really, as a matter of fact, on special occasions by special invitation; theoretically they are always coming, but in practice they are not.

10177. They do come on special days?—Yes.

10178. And appreciate what they see?—Very greatly.

10179. And ask questions and discuss matters?—Yes, very freely. We had a Fruit Conference at Wye last November. I have just referred to it in connection with the strawberries, and we had the place crowded with fruit growers; we had lectures on several different fruit subjects, and we had a very keen discussion.

10180. They would not come all that way, I suppose, unless they thought they were going to get some advantage from it?—No, certainly not.

10181. So that I imagine the value of the teaching and the demonstration work is appreciated by growers?—Very greatly appreciated.

10182. Do not you anticipate that that appreciation will increase?—Yes, I think it is bound to increase.

10183. Will you have to extend your operations in any way?—I think it is bound to increase, because it is a new force and it is bound to go on growing. I do think if we could have stations in other parts of the

county in connection with Wye it would be a very great help. At Wye we have not got a naturally good fruit soil, apart from our geographical position.

10184. Where is your office?—My clerical work is done at my own home—Lyminge, Kent.

10185. I suppose the cost of travelling in your case must be rather heavy on the public, is it not, with a large county like Kent?—Well, I myself have a season ticket for the whole of the county; that is the only way I can work it economically; it is a very big county, and it cannot be done economically without having a season ticket; that I pay for myself.

10186. Your salary is inclusive of your travelling expenses?—Yes.

10187. So that the cost must fall on the ratepayers eventually?—Yes, I suppose it does do that, because they allow me a certain sum as expenses for each duty I perform.

10188. Do you write many leaflets?—For the Board of Agriculture, do you mean?

10189. No, for the county?—The county does not issue leaflets.

10190. The Board of Agriculture do?—The Board of Agriculture do.

10191. Do you think they are of use?—Undoubtedly.

10192. When you go about do you recommend cottagers and people to make use of them?—Yes, and not only that, but I take them about with me and distribute them. The head office sends me a list and I choose from the list those that I think will be suitable for the particular centre that I am visiting, and they are always taken up very quickly.

10193. I suppose one rather sore point with Kent producers is, that they see these fast trains with foreign produce flying past them—produce that they perhaps ought to produce themselves?—Yes, you have touched on a very sore point. A great deal of it comes into Dover and some into Folkestone, and a good many growers have told me that they have had their own produce standing in sidings at the local stations when a mail train comes through with a good many wagons of foreign fruit. Of course there is a reason for the cheap through freights: it is the handling in bulk; but it is a very hard thing for the home growers to see competitive foreign fruit going through in express trains while their own produce is kept back, and while, at the same time, they have to pay more carriage for a shorter distance.

10194. You think more money should be given for the public instruction in horticulture, and for the dissemination of horticultural literature?—I do.

10195. Do you think that should come from the Treasury or from the Board of Agriculture, or both, or from the local authority?—I think it should partly come from the Board of Agriculture, because they understand what is needed.

10196. Better than the local authority?—No, I think it ought to come from both the Board of Agriculture and the local authority. Wye, of course, is already helped by the Board as far as its funds permit, but they are inadequate.

10197. A suggestion has been made by a witness here that any funds given by the State should be given in an equal amount to the funds provided by the local authority, so that it should not fall exclusively on the general tax-payer?—I think there is a great deal in that, more particularly in connection with the work the local authorities are doing in school gardens.

10198. The argument of the witness who put the suggestion forward was, that if one local authority would not give anything it would be unfair to the local authority which was providing its share to give to the one which was doing nothing a larger grant, because they would require more from the Government?—Yes.

10199. You agree with that?—Yes. I do agree with that.

10200. The same witness also put it very strongly to us that whatever grants were given by the central authority they should be administered through the local authority. What is your opinion on that point—that is to say, that no stipends or payments should be paid by the Board in London, but that the Board should organize and control the work, the local authority being responsible for carrying it out, appointing officers, fixing salaries, and paying them, and so on?—Yes, I

Mr. W. P.
Wright.

20 June, 1907

Mr. W. P.
Wright.
20 June, 1907

agree with that, I think the local authority certainly should do that.

10201. I see in the streets now asparagus being sold on barrows; is that British?—At this time of the year it will be British probably.

10202. It is an innovation, is it not, for asparagus to be sold on barrows in the streets of London?—Yes.

10203. The marketing of such a product as that in that way must be due to an increased knowledge of gardening, and an increased number of market gardeners and a greater supply?—Yes, I have seen great development in that particular crop. The cultivation of asparagus has grown tremendously in Essex and Kent. The French growers, who produce very large asparagus, had at one time practically the whole of the trade; their share is very considerable still, but the English trade has grown very much, and I think it is better asparagus. French asparagus is, of course, large blanched stuff.

10204. The taste of the working classes in the large towns—London and the great manufacturing towns in the North of England—for vegetables and fruit is rapidly growing?—Yes.

10205. For instance, I have been told that the Manchester people are enormous eaters of tomatoes.—Yes.

10206. You think that the Government ought to give a grant to horticulture to stimulate and meet these growing tastes?—Yes.

10207. Did you go to the exhibition of Colonial fruit the other day at the Royal Horticultural Society's Hall?—No, a county duty debarred me, unfortunately.

10208. Then you did not see the new species of orange, which is called the naartje?—I am sorry to say I did not.

10209. The agent told me that the Natal Government is spending the sum of £7,000 for the purpose of promoting the exportation to England of that fruit, which is grown by the Dutch farmers in Natal. Are you aware whether the British Government have ever done anything of that kind?—I am not aware that the Government have ever done anything at all in that way.

10210. You would have been likely to have heard of it if such a thing had ever been done?—Yes.

10211. So that we are behind what our Colonies and foreign countries are doing?—Undoubtedly—considerably behind.

10212. Is there any other point that I have not touched upon that occurs to you?—No, I think we have covered most of the points in my synopsis here. One thing that does come very much home to me is in regard to the school gardening, and that we are not able to carry on continuation school gardens in Kent.

10213. (*By Mr. Latham.*) I happen to have had the opportunity of seeing a great many noblemen and gentlemen's gardeners, and I cannot quite agree with you in what you said about them, and I can scarcely fancy that they would quite agree with you themselves. Do you not think that a great many of those men are very proficient men?—Yes, they are proficient in growing the customary crops. All our public exhibitions show us that the produce is very good. We are now speaking of private gardeners exclusively. It is all very well to grow prize peaches when you are doing it with somebody else's money. It is a very different thing when you are growing them with your own money for profit.

10214. Your remark was that you thought the gentlemen's gardeners went simply on the old lines and showed very little improvement. My experience would scarcely lead me to think you were right. I think that these men do keep on improving?—So far as we can get records of exhibition fruit, the grape is not better grown than it was in years gone by, and the cultivation of peaches out of doors is not so good as it was in years gone by.

10215. Is that because we have not got as good trees or soils, or as good management?—I think it may be partly explained by the fact that glass is a great deal cheaper than it was. I think it is to some extent an economic matter; and then I think some gardeners, perhaps because they specialise a little bit more, have lost a few of the old points; a good many modern gardeners specialise in orchids, and are not so good in fruit and vegetables as they used to be.

10216. Your remarks as to the county of Kent would scarcely be applicable to the whole of England, would it?—Not necessarily applicable for the whole of

England, because Kent is more particularly a gardening county, but I was speaking generally then.

10217. It would be difficult for ordinary gardeners in some parts of England to follow out what Kent does?—I should not expect, on the whole, that they would be able to do so well with out-door fruit as we do in Kent.

10218. Or with vegetables?—I do not think that Kentish soils are more favourable to vegetables; the most prominent exhibitors do not practise in Kent.

10219. The climate has something to do with it?—The climate has something to do with it, certainly, but the principal thing for getting fine vegetables is the soil.

10220. You said that agricultural education was making great strides, in consequence of the teaching of horticulture; did you mean that?—I mean so far as horticulture comes under agriculture. I did not mean that horticultural instruction had any effect on general farming; I cannot see any connection there at all.

10221. I did not quite catch your remark with regard to the foreign fruit *versus* English in the cold storage you spoke about. Do you think it necessary for us to go in for cold storage for our fruit much?—I think it would help us to compete with foreign growers after Christmas.

10222. Apples will keep their quality longer than foreign ones will?—One of our best apples, Cox's Orange Pippin, is not much good after Christmas. That apple is in demand at Christmas as a Christmas fruit, and generally realises a very good price. I do not think we must look to that variety for late supplies, but we do want one or two special varieties of apples to meet the foreign competition after Christmas.

10223. There are certain apples we have from abroad that could not be grown in England?—I think that is so; apples that require a more equable climate than we have.

10224. I am rather speaking in ignorance, but I have heard a good deal of discussion about cold storage, and the opinion seems to be that it is not such a profitable thing as people have been led to suppose?—As a commercial matter it has not been thoroughly tried yet. We had quite remarkable results with such fruit as we had to deal with at Dartford; but I do not think at present we have quite the varieties that would be required to compete with the foreign apples late in the season.

10225. That accounts very much for the little interest that the fruit growers in your district take in it?—Very possibly.

10226. What do you particularly advocate the children should do in the school gardens?—Are you speaking more particularly with regard to the elementary schools?

10227. Yes.—May I put it in this way, that you would like me to say what I think would be the most suitable form the instruction should take?

10228. I want to know what it is going to do for their future life?—Nothing very much, unless it is carried through afterwards. I think that so long as the child is merely taught plain gardening for a year or two before he leaves school, and then runs loose afterwards, it is not of much more value than the teaching of parsing.

10229. If children are taught school-gardening, do you think it gives them an inclination to try and get into market gardens, and so on?—Yes, I do think that.

10230. You think it is an impetus to make them take a greater interest in their future life?—It turns their thoughts in that direction, certainly.

10231. My experience, with very few exceptions, is that school-gardens are barely worth the trouble taken upon them. What would you principally advocate the school-garden teaching to be?—I think the great point is to have all the elementary school gardens inspected by practical men, who are able to judge of the most promising pupils, and then that the pupils should be carried on to continuation gardens, so as to keep the children in hand in order to be able to place them in private gardens, market gardens, fruit farms, or the colleges, as the case might be, through the medium of scholarships. I think the principal defect at the present time is, that when the child leaves school he is finished with, and has to look after himself, and he leaves school at an age when it is very difficult to form an estimate of what he is likely to be capable of—a child of 13 years of age is quite undeveloped.

20 June, 1907

10232. In one garden I could particularly name—I am sorry to say it is an isolated case—there is a great deal of bush-fruit growing taught. Do you not think there might be much more scientific knowledge given to the boy in that way than you give almost in any other way?—I think a boy can be taught through the medium of fruit, or vegetables either for the matter of that, much more general and valuable information than in the ordinary curriculum at the school.

10233. I take a great interest in this myself, and I am always falling out on this point that the instructor does not know what he teaches. I have been rather instrumental in trying to get bush pruning, and those sort of things, made a leading thing in these gardens. They can get more information from that than from small things and vegetables I think?—Now, I see your point, that there should be a collective fruit garden in connection with every set of vegetable gardens.

10234. Yes.—Yes, I entirely agree with that. I think the ideal school garden—the one that is to be of real value—is one which gives each child a small piece to grow his vegetables, and also includes a large piece to teach the class the management of fruit.

10235. And at certain times their fathers and mothers could come round and see what they have done. It is very educational in that way?—Yes, this point of the fruit is important, and it makes it more valuable to have expert instruction and control. The teaching cannot be done entirely by the schoolmasters; they do not know it themselves.

10236. To make these gardens of any great value to the boys themselves, they must be instructed in something that will lead them on in future?—Certainly.

10237. Whether the examiner is such a person as yourself, or whether the examiner is a practical man or not, is very little use if there is nothing there for an examiner to decide on?—Exactly.

10238. I hardly expect you to say what the school gardens should be, but if I may express an opinion myself, I would rather they were in the nature of experimental plots than anything else. Is that your view?—I agree that there should be a general experimental plot, including fruit.

10239. Yes, including bush fruit.

10240. (By Mr. Medd.) You have had one or two very successful school gardens in Kent?—Yes.

10241. I dare say you know the gardens of Orpington and Orlestone?—Yes.

10242. They are very excellent gardens, are they not?—They are excellent.

10243. With regard to school gardens, the value is much more educational than technical, is it not?—So far as the instruction goes I do not think the technical value is very great; it does not go far enough.

10244. Educationally they can be of the greatest value in developing habits of observation and care, and arousing interest in and a knowledge of living things—in short, in teaching a child how to open and use its eyes?—Yes.

10245. That you believe is a valuable use of the day school garden?—Certainly; I was particularly struck with the work they were doing at Orpington. The head master there was telling me the results he got. They were excellent, and the children are much interested in the work.

10246. Yes. It is probably the best in England at the present moment. Now to come to the continuation school garden. You would rather have more technical instruction there, that is to say, the instruction should be directed rather to the industry of horticulture than with an educational object?—Yes.

10247. That is your view?—That is my view.

10248. I may say at one village in Gloucestershire we combined the two—the day school, purely educational, and the continuation school, purely technical. I think no other village does that. That is no reason why every village should not do it, if they will take the trouble. Mr. Latham asked you with regard to pruning. That I think is useful work in the way of teaching more dexterity of the hand; that could usefully be brought into the day school garden?—Yes, it would have its value in training the mind of the child also.

10249. And imparting some dexterity of hand?—Yes.

10250. It is a convenient form of rural manual work?—Yes.

10251. Your object in the continuation school garden is to secure employment as gardeners for the students. That is what we found in that village in Gloucestershire, that the leading nurseryman, Jefferies—you may know him by name—was willing to take as an apprentice any boy, and Lord Bathurst's head gardener was willing to take into his garden any lad, also from the school, so that that is what you would take to be the function of the continuation school as distinct from the day school?—Yes, that is my point.

10252. With regard to the supposed deterioration in private gardeners, did you happen to notice the collection of vegetables from the Duke of Portland's gardens at the recent Temple Show?—Yes.

10253. Have you ever seen any better vegetables at this time of the year than those?—They were very fine. I should be sorry to say there was any deterioration in vegetable growing for exhibition, and I certainly have not said so.

10254. I did not hear the remark, but I gathered from what Lord Barnard said, and Mr. Latham after, that you had rather implied that the private gardener has not advanced?—He has not advanced, I think, in fruit growing.

10255. And that he was directing a little more attention to orchid growing and specialising?—I think I should adhere to that, that on the whole his fruit growing has not improved. There is certainly more specialising, notably in orchids.

10256. Take the late Lord Cork's gardener, Mr. Iggulden; you may know him by name?—I do.

10257. Would you consider him a skilled gardener?—Yes.

10258. A man capable of giving excellent instruction in this sort of subject of which we have been speaking—grading and packing?—Yes, he has been engaged in market work for a great many years.

10259. I have been to see him, and have seen his methods, and he does his work remarkably well. Where do you give instruction in Kent in grading and packing?—At the College at Wye.

10260. Do you not give any at Swanley?—I am not connected with Swanley, I do not know whether it is dealt with there;—I have no connection with the College, I do not lecture at the College.

10261. It is taught there. The difficulty, you will agree with me, in an educational establishment like that is the waste of produce involved in teaching grading and packing?—Yes.

10262. That is what prevents its being done extensively?—There must be a certain amount of wastage, of course.

10263. It is very difficult for these educational places to make both ends meet, and wastage must be prevented?—Yes.

10264. With regard to this question of foreign produce, do not you think it is almost entirely a question of co-operation?—It is, very largely. I think that our home growers could do a great deal more if they worked together.

10265. The blame which is thrown on the railway companies far more rightly ought to fall on the individual producer?—I think the producer is certainly very much wanting in not doing what should naturally fall to his share to do.

10266. Combination and undertaking to deliver large quantities, and at regulated times?—Yes, I think there is a good deal in that.

10267. Have you visited the winter schools of horticulture in Holland?—No. I have read about them.

10268. Their methods are excellent, and they are enabled to sell fruit in London when it is rotting on the ground in Kent, and, as you know, in Holland they have no better climate, or not so good a climate as you have in Kent. I wish you would bring this question of co-operation constantly before your people when you do have these lectures, because I am convinced, now we are talking so much of small holdings, that the whole success of the small holding movement will depend on combination and co-operation?—I quite agree with you, it will.

10269. The training of the gardener, the cultivation of the ground, the grading and the marketing of the

Mr. W. P.
Wright.
20 June, 1907

produce and co-operation are the four necessary conditions, are not they?—All are very important and essential to small holders.

10270. Yes, unless we can get them, small holdings cannot succeed only in isolated cases?—Probably.

10271. (*By Lord Barnard.*) You have in Kent a large urban population, such as in the towns round the Medway and on the coast?—Yes.

10272. So that I suppose there is an excellent market in the county for garden produce?—Yes, and particularly in the holiday season. There are a good many market gardens now in the Isle of Thanet, for instance, feeding Ramsgate, Margate and Deal, and at Folkestone and Hythe—my own district—feeding Folkestone.

10273. You have not mentioned the subject of the examinations of the Royal Horticultural Society. Is not that Society doing a great deal for the improvement even of private gardeners?—I am not at all satisfied with the examinations of the Royal Horticultural Society, because they are not practical examinations.

10274. Perhaps they want to train theoretical men more?—Many have thought, for some years past, that they should examine them in practical work. If you go through the list of candidates for those examinations you will find them nearly all connected with training colleges; the private gardener does not go in for them.

10275. The men they examine are practically all those men who are going to be teachers?—They are principally college students of both sexes.

10276. Teachers must be trained somewhere—provision must be made for the training of teachers?—Certainly. I should not say the examinations are of no use, only they miss out a very important class.

10277. You do not think they are of much advantage to the private gardener?—No; very little, as a rule. I think the private gardener does not go in for them

because he has not sufficient dexterity with his pen to keep pace with the college students.

10278. You do not imply that the private gardener is non-intelligent?—No; on the contrary, I think their work makes gardeners reflective, and I think, if they had the advantages of the college-trained student, we should get some very valuable men from amongst them; but, as a class, they have not much scientific knowledge and insufficient general education.

10279. A good many private gardeners in England are Scotch people?—Yes, a great many.

10280. Does not the working Scotchman educate himself to a very much greater extent than the south-country man?—Yes; I was going to say that is the reason why the Scotch gardener gets an advantage over the English gardener. He has a better general education.

10281. Do you know anything of the Botanic Society at Edinburgh?—I know the gardens well; they form a good station for ornamental plants and botany, but not for fruit farming and market gardening.

10282. That has been supported by public money?—I believe so.

10283. Do not a good many gardeners go there and get scientific instruction, and then pass some examination?—I should say there would be a certain number that do so.

10284. Have we anything corresponding with that in England?—We have the Royal Botanic Gardens at Kew.

10285. There is no examination there, is there, and no certificates given?—No, but a young man has an opportunity of observing and improving himself.

10286. Where there is no examination and certificate you have to take a man at his own valuation?—Quite so.

TWENTY-FIRST DAY.

Tuesday, 25th June, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. W. J. GRANT, called and examined.

Mr. W. J.
Grant.
25 June, 1907

10287. (*By Lord Barnard.*) Will you kindly state to the Committee the title of the office you hold?—I am Director of Agricultural Education for the County of Monmouth.

10288. You have held that office since when?—I was appointed on July 1st, 1891.

10289. Under whose direction do you work?—In the early days, of course, I worked under the direction of the Technical Instruction Committee, or at least the Agricultural Committee, who reported in the usual way to the County Council. At present my Committee is one part from the Education Committee and one part nominated by the Chamber of Agriculture, so that farmers and those in the agricultural interest may have a fair representation on the Agricultural Committee.

10290. It is a committee of the County Council I take it?—A committee of the Educational Department, that is a committee of the County Council; it is a committee of the Educational Department with five co-opted members from the Chamber of Agriculture.

10291. Does that committee report to the Education Committee?—As a matter of fact we have to report to the Education Committee.

10292. Who manages the finance? I suppose you control the accounts?—Yes; previous to the commencement of each year I have to prepare a budget, that is confirmed by my Committee and then submitted to the Finance Committee and passed, and my Committee are justified in spending up to that amount whatever it may be.

10293. What was the amount originally allocated to agricultural education by the local authority?—£1,000 exactly.

10294. You have prepared a table showing the expenditure upon agricultural education from the year 1891 to the year 1906?—Yes, I have placed before you the figures.

10295. So that you need not read them through?—No; you have those in full. I might, perhaps, say that at the close of the old scheme of the old committee by the time the Education Act of 1902 was adopted rather more than

Mr. W. J.
Grant.
25 June, 1907

£2,000 stood to the credit of the agricultural side. I pointed out as forcibly as I could that we had been justified in spending all that we had spent, that we had not spent a brass farthing that we were not justified in expending, and the result was that a recommendation was made that we should be given credit for that amount. That, in a measure, has justified us in the increased expenditure that is going on now.

10296. I see that up to the year 1905 your expenditure on this particular subject continued to increase slightly each year?—That is so.

10297. For the year ending March 31st, 1906, there was a slight decrease?—Yes.

10298. Is that the commencement of a decrease which will continue, do you think?—No, it will not continue. The reason for that decrease is that in that particular year our sales were exceptionally good, and we had rather more cider to dispose of from our cider school, and that we received more than we had done the previous year. The sales were greater that year, so practically speaking the amounts that you see are the amounts expended with the sales deducted.

10299. I understand; they are the net cost to the ratepayers?—Yes, the net cost to the public.

10300. You have given us a long list of the work now being done. I do not think I will ask you to read all those, but perhaps you might like to say a word on some of them. In the first place you have a dairy school?—Yes. The dairy school I have given you full particulars of because really and truly that was the first work that we commenced, and you are also given at the end of the statement the actual cost of the dairy school and the cheese school for the last three years; we consider that is worked very economically.

10301. What fees do the students pay?—Those who can afford to pay pay 10s.; those who cannot afford to pay, and who the local representative or my Committee consider are justified in receiving free instruction, they receive it free precisely on the same footing as those who pay. The fees are used for the purpose of giving prizes for each class of ten students, 15s., 10s., and 5s. to the students who come out best. That is an examination by an outside examiner, and at the close of the year gold, silver, and bronze medals are competed for. Those are paid for out of the fees we receive.

10302. Do you find that interest in the dairy school is maintained?—I think the figures we give you speak for themselves.

10303. There is no falling off in number?—No; it is the other way about.

10304. The students do not all come up for examination?—No.

10305. Most of them do?—Yes, the majority come up. Perhaps I should explain also that we make it a standing rule that any student who does not put in the full number of attendances will not be examined, and then sometimes a case of illness or one thing and another will happen that prevents a student from being examined.

10306. You have some visitors to these classes?—Yes.

10307. Do they pay a fee?—No.

10308. They are simply allowed to come and look on?—Yes, we very much like to have them.

10309. In your printed report you make some mention about giving instruction to girls at elementary schools in dairying?—We have done that for some few years. I am afraid that at first, perhaps, it was not altogether legal for us to do so, but we find it has proved thoroughly satisfactory. The girls who attend our classes from the elementary schools receive their instruction free, and, subject to notice having been sent to H.M. Inspector and the gentleman responsible for elementary education in the county, their attendances at the dairy school count as attendances at the elementary school and make no difference whatever as to the grant that they earn at school. The result has been thoroughly satisfactory throughout. Some of the girls whom we have had have not only won scholarships for the cheese school, but one or two of them, I believe, have won the gold medal of the county.

10310. I suppose the instruction in the elementary school is only of an elementary character?—We do not give the instruction at the school.

10311. I mean to the elementary school children?—They go through the same course as the others. We have been inspected once or twice by the Board of Education. I think they were a little bit sceptical about it at first, but

we rather convinced them of the value of the work that was being done and we venture to recommend that the course we have adopted should be carried out in every county in England, Scotland and Wales; it gives those children a practical lesson. If they are the daughters of farmers or small occupiers they get an early training that will be useful to them in their own homes; if, on the other hand, they are the daughters or children of those that are so poor that it will necessitate their going into service they are of much more use, and they obtain better situations than they otherwise would do. That I have had ample proof of, and I think we may practically say that either myself or my staff know every family in the county of Monmouth and we are thoroughly acquainted with those who are worth looking after and who are likely to be of use and credit hereafter, and it enables us to help them on when they leave the school.

10312. Is this dairy instruction in the time table for those schools?—No, it is not. There is a reason for that. I must say that the inspector is in entire sympathy with what we are doing, he understands me and I understand him, so much so that if any of the masters or mistresses are inclined to be restive, and they refuse to let their scholars come, they get a very polite reminder that they ought to come, and we get the children.

10313. The girls I understand are not selected, a whole standard is taken. Is that so?—As a rule either our instructress or myself or the correspondent or the clergyman of the parish know the girls who ought to come, and we take them—those that are old enough and strong enough.

10314. You do not adopt this system in any other subject except dairying, do you?—Yes, we get the girls in the evening for the poultry classes. Of course that is independent of the teaching in the school, but they always come for the poultry classes in the evening. We get the boys also for the lectures given by the veterinary surgeon in the evening, that is boys from 14 and upwards. Then I have taken the older boys from the schools in the district where I have been myself giving a demonstration in the planting and pruning of young fruit trees. The boys attend and probably after seeing one tree planted they will plant the remainder themselves, and possibly root prune and top prune one or two trees and then write an essay the following day on what they have done. These essays are submitted to me and I correct them and send them back. They are not retained at the school, but go from the schools to the parents of the children, and that is useful in creating interest in the instruction given. Then in addition classes are held for fruit packing.

10315. They are not quite on the same footing as the dairy instruction inasmuch as they are not given in the school time?—Yes, the work in the orchard is given in school time, and the work in hedging and basket making which we do is also given in school time.

10316. (By Mr. Latham.) What do you mean by school time?—School begins at nine in the morning.

10317. Is that your own school?—I am speaking of the elementary schools in the county.

10318. Does that not interfere with the curriculum of the school?—No. Notice is given and they attend twelve days for basket making and the attendance at these classes is reckoned as attendance at school. If it is hedging they attend for the same time, and that is reckoned as attendance at school also.

10319. (By Lord Barnard.) These girls who attend these classes are eligible for these prizes of which you have told us?—Yes—you are alluding to the girls at the dairy school.

10320. No, I was referring to the girls from the elementary schools?—The girls from the elementary schools are taught upon precisely the same conditions as those who come from other sources and pay. It is always arranged that they are examined in a separate class by themselves. If they gain not less than 80 marks they get their certificate of proficiency, and the best girl who gets the highest number of marks gets a prize, and so with the second and third.

10321. Every student who gets over 80 per cent. of marks gets a certificate?—That is so.

10322. You also give dairy school demonstrations?—Yes.

10323. What is the object of those?—The instructress will give a demonstration at the opening of the school to give outsiders an opportunity of seeing what is done and the way in which the pupils are being taught. During the time the dairy school is in that district she will also

Mr. W. J.
Grant.
25 June, 1907

give one or two demonstrations with a separator, showing the value of the use of a separator as compared with skimming.

10324. Is it largely to stimulate interest in the classes ?—No ; it is more for the purpose of giving instruction ; the interest, I think, is well maintained. In the early days we had to stimulate interest, but now it is not necessary for us to do anything in the way of creating interest, that object having been already attained.

10325. You also give lectures at the dairy school ?—Yes.

10326. Are there any other subjects in connection with the dairy school which you would like to mention ?—I think the questions your lordship has put to me have made it perfectly clear as to what has been done.

10327. Then we will go to the cheese school. You also have a cheese school ?—Yes.

10328. Is that something on the same lines as the dairy school ?—The cheese school has been going on since 1895, and each year that school is held in a different farm in a different portion of the county. The county of Monmouth, as possibly you are aware, is rather of a varied character as to pasturage and soil. Caerphilly cheese is made in almost every portion of the county. Some portions of the county are very much better adapted for cheese-making than others, but my Committee thought, and wisely, I think, that it should be shown to the people that it was possible to make good cheese in almost every part of the county. For that reason we take a different farm for the cheese school every year. The arrangement we make is that my Committee shall receive the whole of the milk produced upon the farm, and in order that our receiving the milk for the use of the school shall not in any way interfere with the usual dairy customers or business of the farm, if they require so many pounds of butter, so many soft cheeses, so many pounds of Caerphilly cheese or Wensleydale cheese as it may be for their own customers that is supplied to them from the cheese school. It is made entirely by the instructress and those who are taught. The result has been thoroughly satisfactory in every way. In every instance where the cheese school has been there has been an increased demand for produce from that farm. The prices have always been of the best and I need not say that they have adopted the principles that have been taught there. In addition to that our instructress gives one evening every week what might be termed a public demonstration or object lesson in cheese making ; that is very well attended.

10329. What is the length of the course in the cheese-making school ?—Three months ; we do the migratory work and the cheese school work with one teacher.

10330. Do you know whether the fact of so many people in the county of Monmouthshire having passed through these schools has at all affected the price of their produce afterwards ?—Yes it makes this difference that those who have attended the cheese school never get less than 6d. a pound for their cheese, whereas those who have not have frequently had to be content with 42s. to 45s. per cwt., while the others have got 56s. per cwt., and butter 1s. 4d. to 1s. 6d. per lb.

10331. You have a large mining industry in Monmouthshire ?—Yes.

10332. So that there is always a good market ?—Quite so.

10333. You have some scholarships for the cheese school ?—Yes, ten scholarships are competed for every year for one month's free instruction at the cheese school.

10334. I understood you to say that the course was three months ?—The cheese school lasts for three months.

10335. When I asked you what the length of the course was I was referring to the length of the course of instruction in the cheese school ?—I beg your pardon—the course of instruction for each student is one month. Sometimes we get a student there for three months, but that will be a student who will be paying for two months out of the three. The scholarships only extend for four weeks because we consider, and it is an acknowledged fact, that Caerphilly cheese-making can be taught thoroughly and completely in one month's instruction ; that includes milking the cows and the principles of both cheese making and dairy management—all through the whole of the curriculum.

10336. I am afraid I do not know anything about Caerphilly cheese. Is it sold in London at all ?—I tried to get one or two firms in London to take up the sale of it, but they did not take to it very kindly ; they seemed to consider it rather a tasteless cheese. But those who know Caerphilly cheese and who have been used to it like it very

much indeed. It is one of the most digestible cheeses made. I may say that Caerphilly cheese last December was making 70s. a cwt. when only a month old, so that rather shows it is not a cheese to be despised.

10337. At any rate you have got a good market for it in your county ?—We have a good market for it, and it is a cheese that pays best in Monmouth. Monmouth is a county of small farmers and small occupiers comparatively speaking, and it is our duty to lay ourselves out for the mode of instruction which will be most advantageous to them.

10338. Will you tell us whether the same remark applies to Wensleydale ?—With regard to Wensleydale our dairy-teacher was the first person to make Wensleydale cheese in Monmouthshire. I may say my Committee sent her to Wensleydale to learn the principles there. The chief object for making Wensleydale or for recommending the making of Wensleydale is this, that Cheddar cheese-making is not altogether as satisfactory and profitable as it might be perhaps in the Cheddar country, and they have taken very largely to making Caerphilly. This Caerphilly is considered by some to be an excellent cheese, although some of us may have our doubts about it. The Somerset Caerphillies are very often not whole-milk cheeses at all—those they exhibit are, but the bulk of them are not. They make butter and they make Caerphilly cheese as well, and the advantage is that in their large dairies they are able to put down half a ton of Caerphillies of all one type. That is an advantage they have, and that very materially affects the price of Caerphillies during June, July, and part of August. Now during that period we recommend our people instead of making Caerphillies to make Wensleydale, and if they do so, instead of their milk realising to them 5½d. a gallon, it will be far more likely to earn 10d. That is the reason why Wensleydale is made.

10339. Where is the market for the Wensleydale ?—All the Wensleydales produced in Monmouthshire can be sold now three or four times over. I frequently have to get Wensleydale for my friends from Wensleydale.

10340. (By Mr. Latham.) What is about the length of time it takes to teach them to make Wensleydale ?—They generally contrive to get through the Wensleydale and to know a good deal about it in a month. A certain quantity of cheese will be made when they come to the cheese school, and a certain quantity will have been made just before they come, so that they will have an opportunity of seeing the different stages. I ought to have mentioned in regard to those schools that in addition to the work taught or the instruction given at the dairy and cheese schools we have had a good many really poor people to deal with, and our instructress goes to their dairies and teaches them how to make the most of the old-fashioned utensils they have got in order that they will be able to produce just as good butter, or rather better butter and better cheese in their own dairies than is being done at the dairy school itself.

10341. That is exactly what I wanted to draw from you.—That has been taken up well, and I can assure you that that had a great deal to do in the old days with breaking down what we thought insurmountable difficulties, or shall I say obstructions, that we met with when our work commenced.

10342. (By Lord Barnard.) Perhaps now that you have touched upon that question you might tell the Committee generally—you have already referred to it—what the attitude of the agriculturist in the county of Monmouth is towards this instruction ?—When I began some 16 years ago, and even when I had been at it for some few years I often wished that I had never touched it, I will admit that. It was rather near heart-breaking, and I suppose if I had not been a Highlander I might have thrown it up ; but their feeling to-day is very different : we have appealed to their minds, I say it with all seriousness, through their pockets. Those who have received instruction, both their sons and daughters and themselves have realised that it has been of an economic and commercial value to them ; they are able to make more of their dairy produce and more of their fruit and the general output from their farms.

10343. Is it your opinion that the continuation of this work and an expansion of it, if possible, would meet with the approval of the ratepayers of the county ?—Yes, it would.

10344. Now I will just run very briefly over these other items of instruction that you give. You have competitive examinations in milking for which I see by your printed report you have a considerable number of entries every year ?—That is so.

Mr. W. J.
Grant.

25 June, 1907

10345. In looking at the list I see you dealt with more men than women. Is milking usually done by men in the county of Monmouth?—Both men and women. Alluding to that, it might interest your lordship and the Committee to know that one of our girl students who gained the gold medal in the open competition at the Bath and West of England meeting at Newport was first in the butter making competitions, and was also first in the open class for milking. Her sister, who won the bronze medal, was third in her class for milking. The girl who was first in the girls' class for butter making was first in the girls' class for milking.

10346. What is the teacher, Mr. Gibbons?—He is the examiner; the teaching is practically given by our dairy cheese school instructress. She is not only qualified but she is an excellent milker herself.

10347. Do you give a certificate to everybody who passes in the case of milking too?—Yes.

10348. You have given us the numbers who come up for those examinations?—I have.

10349. They are probably people who have been through the dairy school or the cheese school?—Yes.

10350. So that some of the dairy and cheese school pupils go in for the competitive examinations in milking?—That is so.

10351. Where do the students live?—We make it a *sine qua non* that those who attend the cheese school must live in the house.

10352. Are your farmhouses in Monmouthshire so large, then?—That is one of the difficulties we have to contend with. They are not as a rule very large, and I have to select for the committee such a place as I would send my own daughter or my sister to. I always bear that in mind, and there is a rigid system of inspection. The practice has always been that it is clearly and distinctly understood that from the day the cheese school commences till the day it closes they never know when they may expect me down, whether at breakfast time, dinner time or tea time, to see that everything is in proper order or otherwise, and we have never had any difficulty in that way. They never know when they may expect me.

10353. What is about the expense to the students?—The amount we pay weekly for each student is 15s., that is for board and lodging; washing they have to provide for themselves. We also pay for the conveyance of the students to and from the stations; the instruction, of course, is free.

10354. Does that come out of the County Council fund?—It comes out of the grant. Everything that is spent is shown in the figures before you, and those figures are audited; they are taken from the auditor's accounts.

10355. No questions of discipline arise?—They never have done, and of course if anything did arise in that way the students would have to go home immediately.

10356. You also give a fortnight's instruction to young men and lads in hedging?—Yes, that would be not only to the sons of farmers and the employees on a farm but to the boys I alluded to also from the elementary schools.

10357. Do you think that has a good effect?—Certainly. I may tell you that when I went to Monmouth 15 or 16 years ago you might have only found in the county perhaps 25 competent hedgers, whereas I can find you 100 to-day. At that time I could only get three men in the whole county who were competent to give instruction in hedging; there were men who knew how to hedge, but I could not get more than three men who were competent to give instruction in it, and we should have no difficulty in finding a dozen or more to do so now.

10358. Something of the same kind is done with regard to sheep shearing?—Yes; notwithstanding what has been said about shearing by machinery you will see from the figures that I have given that shearing by hand still holds its own. In certain parts of the lowlands shearing by machinery may be taken up, but in the hill district and with hill sheep machine shearing does not answer.

10359. Are the flocks large usually in the county?—They vary very much—from 250 in the lowlands to as many as 700 or 800 or perhaps 1,000 head in the hills.

10360. I suppose the introduction of shearing by machinery is only a question of time and money?—Yes. I think in the lowlands for the heavier sheep—close wool sheep and the long wool sheep, too, it is possible that shearing by machinery may come in.

10361. Until sheep shearing by machinery becomes common in the county you think it is your duty to have

these classes, and your experience is that they are appreciated?—Certainly—when the number of attendances does not decrease.

10362. (By Mr. Latham.) Are these two men, Mr. Rees and Mr. Edwards, practical men?—Yes. Mr. Rees was a farmer, but at the same time I think he has, perhaps, won as many prizes for hedging as any man in the county; he is a thorough practical man, and he is our basket instructor also. Mr. Sidney Edwards I can say the same of as a shearer. They are both men who are thoroughly competent to teach, and men who are held in very high respect by everyone who knows them in the county, and at the same time they are workers in the truest meaning of the term.

10363. (By Lord Barnard.) I suppose the horse shoeing instruction and examination is something on the same lines, is it not?—Yes; that has been going on for something like 13 years, I think, and I can only say—I believe Mr. Latham has some knowledge as to whether the Monmouthshire men are any use or not—that perhaps the shoeing smiths in Monmouthshire have won more prizes at open competitions at great gatherings than smiths in any other county in England. Any shoeing smith who has practically anything like a decent business is a first-class prize winner. We offer each year at Lord Tredegar's show a prize which is only open to first prize winners, and we have always 20 or 30 men down to compete, although year after year the man who gets the prize is left out. The shoeing classes have proved most satisfactory and they will be continued.

10364. I see they include light horses and hunters as well as heavy horses?—Yes. I may say every shoeing smith of any account in Monmouthshire is a registered man, and that he has trained his apprentice to the best of his ability to beat his neighbour's apprentice, so that they shall get our prize and ultimately be examined by our examiner, Mr. Storrar, for registration.

10365. Does the old practice of apprenticeship still exist in Monmouthshire in regard to shoeing?—To a certain extent it does in the country, but not so much in the hills; still it is an understood thing that if a young fellow goes to a smithy he remains for four or five years, and they always like to keep a man until he has been through our classes and has got a certificate from us.

10366. Is your instructor, Mr. Storrar, a practical man?—He is a Fellow of the Royal College of Veterinary Surgeons and a recognised examiner. We have done practically all the teaching in Monmouthshire without actually having had to employ a shoeing smith to teach the men.

10367. (By Mr. Latham.) Who has taught them then?—They all have to come up to a certain standard to satisfy Mr. Storrar before they will be examined, and their masters teach them, after which they come up year after year till the pass for registration by the Worshipful Company of Farriers has been obtained.

10368. (By Lord Barnard.) In fact you have a high standard of shoeing in your county?—We have, and we consider it is entirely due to the work that Mr. Storrar has done.

10369. Then you give instruction in cider and perry making; are you associated with the Cider Institute?—Yes, unfortunately I am; I happen to be honorary secretary. I can only say we are very proud of the Institute. We believe it is doing work that is entirely original, and I think there is a great future for the work that will be done from there.

10370. You state here that a considerable amount of advice as to the management, bottling and after-management of cider has been given; how is that given?—That alludes to Monmouthshire; that is from our own cider school.

10371. That is a distinct thing?—Yes. Monmouthshire is really the only county in Britain that possesses a cider school of its own, and it is of quite an older date than the Institute itself. The way we manage is this: at a certain farm in a certain district where there is an orchard and the owner wants instruction as to how to make the best of his vintage fruit, postcards and invitations are sent out to all his neighbours within four or five miles to attend, and Mr. Wootton attends and gives a lecture on the grading of fruit. Later on he takes a certain proportion of the fruit and crushes that fruit at our own mill. We have a complete travelling mill and plant of our own, and later he will attend for the purpose of racking, and later on for bottling. A certain portion will remain in wood and a certain portion will be bottled, and the farmer has an

Mr. W. J.
Grant.
25 June, 1907

opportunity of comparing the cider which is made by my Committee's instructor and the cider which is made by himself. I need not tell you which is the best. The result is that in Monmouthshire the maximum price for cider at one time was 8d., and that is now the minimum price. We get 1s. 3d. a gallon for cider that we send to Scotland for bottling. We do the whole of the work right through at various farms, and each year we give prizes at our annual gathering for cider.

10372. I do not know that I need go quite so thoroughly into all these items; is poultry on the same lines?—Yes, poultry is much on the same lines.

10373. And bees?—In the same way.

10374. Sterilising and bottling fruit?—That is very much on the increase, and I may say that last year the amount bottled could have been sold four or five times over.

10375. I see the next item you have is basket making. Do you consider that an agricultural operation?—Most certainly. Where there is a farm, or where there is a garden, or where there is an orchard, baskets are a necessity, either for carrying weeds or for carrying produce or for carrying fruit or roots when cut for the animals.

10376. They are made of willow, are they not?—The baskets that your lordship is alluding to particularly are not made of willow. They are made of wood that is within the reach and that can be obtained by everybody in the county of Monmouth. If our instructor, Mr. Rees, restricted himself to using willows, then it would be a question of buying the material, but any small farmer in the county would be a very poor fellow if he could not find his way to a spinney or a hedge and cut sufficient hazel and split it to make baskets with. The men who have attended the hedging classes have an opportunity of receiving instruction in basket making when we cannot lay hedges, and the lads who attend the hedging classes from the schools have an opportunity of doing the same. I can assure you that the baskets that were made by the boys last year—not by the men, but by the lads—realised at our annual gathering, to be sold again, 24s. a dozen.

10377. (By Mr. Latham.) These baskets are baskets that are quite peculiar to your county?—They are what are called coracle baskets; they are peculiar, but they are most useful.

10378. The large majority of baskets are made from willows, but these baskets that you make are made from the growth in the county?—Yes. Of course willow baskets could be made in the same way. These coracle baskets are also made with handles across for carrying them by.

10379. (By Lord Barnard.) Has it always been the practice to make these baskets, and are you simply trying to extend it, or did you create the idea?—We created the idea.

10380. Do you claim that you are assisting the farmer pecuniarily in enabling him to make his own baskets?—Most certainly we do.

10381. You give lectures on agricultural subjects at a reformatory farm school?—Yes, those were lectures given by myself personally.

10382. I am familiar with one industrial farm school in the north. I suppose the work is done by the boys very largely?—Yes.

10383. Under their own teachers and masters?—That is so. I utilised it very much in the earlier days as a centre. The great principle I adopted there was to give the lads an opportunity of understanding the principles that underlay their practical work—the reasons for doing the things they did.

10384. Did farmers attend the lectures at the reformatory farm school?—No, that was for the advantage of the lads there and the officials only.

10385. Do you know as a matter of fact whether those lads go on to farms after they leave the school?—I am very glad to be able to say that if the lads were left alone and allowed to follow their own will their inclination would not be to go back to the homes from whence they came, but the difficulty we had to contend with was that their parents knew that if the lads behaved well while at the school they had a certain amount of money due to them when they left, and they used to want to get hold of them in order to get advantage of the good conduct money that the boys were entitled to. That is the great difficulty we have to contend with, but the lads from the reformatory school have on the whole done well, either in the army, or wherever else they may have gone. Many of the lads that I have been able to place in situations in the country have given entire

satisfaction. I may say I have employed boys from there myself, and I have been very well satisfied indeed with their behaviour.

10386. Of course the only point that this Committee is interested in with regard to this particular branch, is as to whether the instruction which you give at that school has the result of planting on the land either labourers or perhaps eventually small farmers, who otherwise would not be there—more or less skilled men. Is the expenditure justified do you think by the result?—Yes, I do. I may say that I have fought that out with the Local Government auditor for a good many years, and I have always been able to beat him on that point, and the Local Government Board have admitted it. I say without the slightest reservation that perhaps the best work I have ever done in my life has been at the reformatory farm school at Little Mill.

10387. (By Mr. Latham.) May I ask you what the demonstrations were that you gave?—At Little Mill?

10388. Anywhere—you say "Lectures and demonstrations"—what are the demonstrations?—Fruit planting and pruning—you are alluding to the demonstrations given by myself?

10389. Yes.—That would be planting and pruning of fruit trees.

10390. That is horticulture?—Yes.

10391. (By Lord Barnard.) Do you give any lectures and demonstrations in agriculture?—Yes.

10392. At the school?—Yes. All the agricultural lectures that have been given hitherto in Monmouthshire have been done by myself.

10393. You are sole instructor at the school?—Yes. The work I have done there has been to deal as thoroughly and as completely as I possibly could with both agriculture and horticultural subjects.

10394. (By Mr. Latham.) Just tell us what the demonstrations are in agriculture?—At Little Mill?

10395. Yes.—Supposing the boys are turning over a compost heap, I deal with the compost heap, its constituents and where they came from. Similarly, if they are doing draining, I also deal with the drains; why they are necessary, how the drains should be laid; and if they are ploughing I want to know why they plough at a certain depth; and if they are ploughing a fallow or forming a furrow on a stubble, the difference between the two, the soil and the crops that ought to follow. If it is a case of planting potatoes or lifting potatoes, I deal with that in the same way. If it is the case of a potato crop that they are lifting, the reason why they are able to take the time of lifting as being the time to select the seed for another year's planting; storing the seed, storing the potatoes, and so on, is explained; and if I happen to be there at the time of milking, I want the cows milked in my own way—and I show them the right and the wrong way. I also explain as far as possible, for instance, the constituents of inorganic and organic soils, dressing the foot of a sheep, and planting a gap with young quick.

10396. (By Lord Barnard.) You also give inspection and advice upon the planting and selection of trees for shelter, forest, and ornamental purposes?—I do.

10397. Do the owners of land take much interest in that?—Yes. I have to give advice on forestry and ornamental tree planting, and the planting of orchards and so forth every year.

10398. Mr. Storrar, of whom we have already heard, gives lectures on veterinary science?—Yes.

10399. That is elementary veterinary science, I suppose?—Yes.

10400. On the hygiene of farm animals?—Yes.

10401. Those lectures are well attended?—Very well attended.

10402. You have also carried out some pasture experiments?—Yes.

10403. Are those upon private property?—Yes.

10404. How long have those experimental plots been carried on?—For 12 years or more.

10405. Will those be continued?—Yes, they will be continued.

10406. I see you have also, under the instruction of your Committee, undertaken to carry out some experiments in the cultivation of sugar beet?—Yes.

10407. And also in potatoes?—Yes.

10408. Are potatoes much grown in Monmouthshire?—Not so much grown as they should be considering that it is a great consuming county.

10409. You keep yourselves in touch with horticultural associations and societies?—Every horticultural and agricultural society in the county.

10410. You know what they are doing, and attend their shows, and so on?—I do—practically speaking, with the exception of about two small societies in the county we have to do with every horticultural and agricultural society in the county.

10411. I daresay you and your staff find it a good thing to go about to these societies—you get to know the people and they get to know you?—Yes; we get to know the people; we do not wait for them to come to us, we go to them.

10412. May I ask you with regard to the finance how do your Committee feel their position with regard to that?—My Committee feel that they would like to do even considerably more than we are doing, but the objection, and the natural objection, is that if they do it means an increased rate. We have gone just about as far as we can go. As I have indicated, there is a greater demand for assistance and work than we are able to supply; we have not got the supply, and what is felt by Agricultural Committees, especially in the county in which I have the advantage of working, is that the work they have succeeded in doing justifies the money that has been expended upon it, and that the time has come when some other provision ought to be made for the extension of that work. I venture to suggest that if in each county a committee of the County Council was created to act in conjunction with the Board of Agriculture and Fisheries for the purpose of carrying out agricultural education, the administration of the Fertilizers, Diseases of Animals and other Acts that may or shall affect the industry of agriculture, such a committee, if assisted with sufficient funds, would be the proper authority to both carry out agricultural education and administer the Acts referred to with effect and economy.

10412a

10413. (*By Mr. Latham.*) Do you mean that to be all under the county council—do you mean to work with or under the county council?—Yes.

10414. (*By Lord Barnard.*) You do not mean that this should be an independent local authority?—No; not an independent local authority: it should be a committee of the local authority, not independent. I am strongly of opinion that the detail work in connection with agricultural education should be carried out by a committee in each county through a staff responsible to that committee for the work entrusted to their charge. I have arrived at this conclusion from what I have seen in various counties I have visited, either as an examiner or otherwise, in England, Ireland, Scotland, and Wales. I am simply giving an expression of the opinion of those who are interested in the welfare of agriculture and agricultural education in the county in which I am working.

10415. You have spoken about having had experience in other counties; you will tell us whether that opinion is limited to your county solely or whether that is being considered elsewhere?—That is being considered elsewhere, and I may say from men I have spoken to in other counties that they think in the same direction as myself. I say with a certain amount of satisfaction that some of us at least have justified what we are doing, and that the time has come when the good work we have been endeavouring to do should be extended considerably. Our object is—and I am sure it is the object of everyone whose heart and soul is in the work—to do it in such a way that it shall best serve the interests of those who are gaining their livelihood on the soil, and to do our level best to keep those who have been reared upon the soil in the country where they are wanted. That is one reason why I speak so feelingly about Little Mill, where after I had been dealing with the boys there for some time they got a liking for the country, got to know something about the country, and wished to remain there instead of drifting back into the towns from whence they came.

10416. I suppose a great many of those lads did come from the towns?—Yes, many of them did, and they wished after a time to remain in the country.

10417. Your view shortly is this, that it would be very desirable if in every county one committee of the County Council had under its jurisdiction all the powers, duties, and liabilities which bring it into contact with the Board of Agriculture?—I do, most definitely.

10418. You also are of opinion that that committee, although administering perhaps funds drawn through the

agency of the Board of Agriculture as the central authority in London, should have the appointment of the staff, that the staff, in other words, should not be appointed in London or controlled in London?—I think that if the Board of Agriculture is contributing, as I hope they will, towards the funds of agricultural education that they ought to have some voice in the appointment of the officers who are carrying out the work in the counties. I think that it would be an advantage to the committees if the counties were to have the advice and the assistance of the Board. The Board of Agriculture are, as we all know, in touch and sympathy with the industry of agriculture throughout the whole of the country; they know everybody; they know what is being done in different parts of the country, they know what has been done and what can be done with advantage and disadvantage, and they also ought to know, and I believe they do know, what might be taken up with advantage in some counties that are not doing perhaps as much as they ought to do.

10419. From a national point of view do you consider that it is desirable that that sympathy and that interest which you have just mentioned exists between the Board of Agriculture and the practical agriculturists should be strengthened and drawn closer?—It would be of great advantage to the well-being of agriculture in the country if it were, and I say this for our county that if we were only assisted to-morrow by the amount of £50 from the Board of Agriculture it would be appreciated so very much that for every £50 that came through such a source the county would willingly give £50 more. You see we had to fight at first, and that is the reason I worked so economically in the early days; people used to grumble considerably about the rates, and I used to say: "The most of the money that we have to spend comes from the 'whisky money,' and if it is a halfpenny rate that comes from you, if you do not get the value of that halfpenny you are fools, it is your own fault"; and if they could realise that the work I have been doing for many years was appreciated by the Government through the Board of Agriculture it would arouse the very fine feeling which I have been striving to create permanently.

10420. You have no grant at all at present?—None whatever—first and foremost, the Board of Agriculture legally in our present state of affairs could not give it to us.

10421. You think you ought to have a grant?—Yes, I do; I think we are justified in asking for it.

10422. If money from national funds is given for the purpose of promoting higher agricultural education I suppose you would not object to the work done in each county being treated as part of a whole national system?—No.

10423. And subject more or less to the guidance and supervision of the Board of Agriculture. By supervision I do not mean interference, but advice and so on?—We should not be justified in objecting to that.

10424. (*By Mr. Latham.*) Taking this paper which you are good enough to send frequently to me, and of which I fully approve, I should like to know if you are successful in teaching all these several subjects and what you would propose to do to assist any of your population who would like to get a more scientific knowledge of agriculture. Are you attached to any of those collegiate centres marked on the map?—No, we are not.

10425. Will you just give us your own idea with regard to this very important question?—I take it your question really means that you would like me to state what I think ought to be done in Monmouthshire with regard to those whom we would consider some of our best and most promising students at present, considering that we have not got an agricultural school of our own, and that we are not attached to any of the colleges?

10426. Yes, that is so.—As you will see in the last sentence I put here I say I am strongly of opinion that the internal work of each county ought to be done by a staff in that county who are responsible. One point of view in holding that is this, that it gives myself and my staff an opportunity of coming into contact with everybody and knowing everything about everybody; it gives us an opportunity of sifting people and finding out those who are worth going on further with. Why we have been unable to give any scholarships up to the present is that we have not had the money or the means of doing so; but what I should like to be able to do as long as we had not an agricultural school of our own would be to select the young fellows whom we consider are worth training and worth going further and send them to a first rate agricultural college for further training with a

*Mr. W. J.
Grant.*

25 June, 1907

Mr. W. J.
Grant.
25 June, 1907

scientific bearing. The practical agricultural training that is of most value to a farmer's son is the practical training that he gets on a first rate farm that is being made to pay, but for a scientific training he must go to a place like Leeds, or Newcastle, or Edinburgh, or one of those centres where he will get a scientific training of a very high standard.

10427. Or Reading, which is closer to you ?—Or Reading.

10428. (*By Mr. Medd.*) Or Cirencester, which is closer than either ?—Yes, I quite agree.

10429. (*By Mr. Latham.*) You expressed the opinion that it was very desirable that all farmers should be fully equipped with the best knowledge of practical agriculture. You do not wish us to understand that there is not much in science as regards agriculture ?—A successful agriculturist must of necessity be thoroughly conversant with science as applied to agriculture.

10430. Although you are not attached to any of these several colleges you would have no objection and would offer no opposition should you have the opportunity of being so attached ?—I think the simplest answer I can give to the whole question is that the plan I should like to see adopted is the plan I have carried out with my only boy. Perhaps I have not put it as clearly as I might have done. What I am doing with my own boy is this: I am giving him the best agricultural training that I possibly can by sending him to the best farm and the best dairy I believe to be in the kingdom, hoping that ultimately he will get his B.Sc. at Edinburgh.

10431. One of your strongest arguments in coming before us to-day is to show us that with a greater assistance from the Treasury you could do a very great deal more work ?—We could.

10432. And part of that work would in all probability be scientific education ?—That is so.

10433. I see as a matter of fact you are having a great deal more money that you used to have ?—We are spending more money, but the "whisky money" is decreasing.

10434. Where do you get this money from ?—From an increased rate. Previous to the adoption of the 1902 Act the money that we had came from a halfpenny rate; now there is a 2d. rate for the higher education rate. Previous to the adoption of the 1902 Education Act there was a halfpenny rate for technical instruction in the county, but since then there has been a 2d. rate for higher education, which embraces agricultural education as well.

10435. That I think shows conclusively that this county is doing what very few other counties are doing, that is, assisting agriculture through their rates ?—Yes, and that is why I tried to say pointedly we are doing just as much as we can, and we cannot go any further than we have done. We feel it a hardship on the people.

10436. (*By Mr. Davies.*) Mr. Latham has already asked you with regard to the scientific part of your training, and as you are no doubt aware nearly all the agricultural colleges who have sent representatives to give evidence here are affiliated to some centre, usually a university centre ?—Yes.

10437. I understand that you contend that these people who give agricultural instruction in a county should be under the County Council, and not under any university or college authority ?—I do. That is, I feel very strongly that each county should be able to carry out its own internal work by a staff responsible to themselves for the work which is being done.

10438. But supposing such a body was anxious to come under a particular college, you would not be prepared to become responsible for the staff and become really one of the staff upon that college ?—That would be to the advantage of the college, but I question very much if it would be to the advantage of the county.

10439. Not that you would give up your residence in the county ?—No, but I do not know that that would be altogether to the county's advantage. I am speaking generally. I am not speaking of any one college in particular, but the very definite impression that I have formed is this, that where the agricultural colleges, or where the universities may be of advantage to the counties, would be for the purpose of sending young fellows there to be taught the scientific work that could not be done in the counties. I want you to understand clearly that I am not speaking of any one particular college, but that is the conclusion I have arrived at by taking stock of what is being done throughout the country.

10440. That is the view you have expressed already, I

believe ?—Yes, that is the view I hold. Now where there is more money spent, and where perhaps the best work is being done is in Lancashire. More money is spent upon agricultural education in Lancashire than in any other county in the kingdom. I have examined there, and any man whom I have passed anything like decently, I have always found has within 18 months taken his B.Sc. at Edinburgh. Do not imagine for a moment that I am deprecating in the slightest degree the work of the colleges, but I am speaking now with regard to the internal work of the counties.

10441. But you would admit, would not you, that if you were on the staff of the particular college, you would get great advantage from being closely in touch with the higher work that was being done at one of these college centres ?—Yes, that may be so.

10442. And it would prevent you getting into a groove of your own, perhaps ?—You cannot hold your own to-day unless you move on, and we have to move on with the rest.

10443. Then you told the Committee about the classes in the elementary schools, and is it also a fact that nearly all the elementary schools have mining classes as well ?—No, the mining classes are arranged in connection with the higher education, which used to have an industrial side for the technical work. They were evening schools independent of the other teaching. As far as I am aware I do not think that is so in Monmouthshire.

10444. Have you got any evening schools in Monmouthshire ?—Yes.

10445. How far does your agricultural teaching come under them there ?—I have personally nothing to do with the evening schools. There is a fair sprinkling of farmers' sons who go to the intermediate schools in Monmouthshire, but, strange to say, with the exception of certain parts of the county, few of the farmers' sons who go to the intermediate schools remain farmers. They generally go to the iron works, coal mines or to business.

10446. Is that due to the kind of instruction they get ?—I think it is due to the fact that having gone to the intermediate schools after leaving the elementary, they prefer going to engineering or trade in preference to taking up agriculture.

10447. I think you told the Committee you held classes in the evening in various centres for farmers' sons and labourers' sons who had left the elementary schools; is that so ?—All the classes that we hold in the evenings are available for those who have left school, as well as older people, and the older lads who have left school invariably attend those classes.

10448. For how long does the course last ?—Six weeks.

10449. In each centre ?—Six weeks in each centre.

10450. Do you find that there is much difficulty in getting the boys to attend if they have to travel long distances ?—We always arrange the classes in such a way as to avoid the trouble of travelling long distances. Invariably our attendances are very satisfactory indeed.

10451. Then those classes would form the basis of ordinary scholarships, would they, for higher centres ?—No, we have not sufficient funds to give scholarships.

10452. But if you had ?—If we had, then we should arrange a subsidiary course and form scholarships.

10453. And those classes would answer that purpose, would they ?—If the classes you are alluding to would not answer that purpose, then classes would be arranged to justify examination for scholarships.

10454. Are you aware that at Cardiff College they have already initiated classes for farmers' sons ?—I am.

10455. Have any of your men who are farmers' sons in Monmouthshire gone to take advantage of that ?—I do not know. A few may have from the Maesycwmmmer district, but that I am not sure of.

10456. Do any of your students go on to Reading to complete their courses there ?—No, so far they have not.

10457. Then none of the farmers on their own account who have got scholarships from the County Council have sent their sons outside the county ?—No, they have not.

10458. You are paid by the county, are you not ?—We were, and now by the Education Committee. The County Council are independent so far.

10459. In your general work as supervisor of agricultural education in the county, do you give problems connected with agriculture, especially with regard to

co-operation, and that sort of thing?—With regard to co-operation I have not done so.

10460. You do not consider it is part of your work?—By co-operation you mean co-operation in regard to purchasing and selling, do you?

10461. Yes.—I do not consider it is part of my work.

10462. Do you investigate problems like beet growing, and that sort of thing?—Yes, I do, and, as I have already indicated, any information or any advice required upon matters agricultural or horticultural, or forestry, I have to give. I have to inspect and report upon those matters.

10463. I think you told the Committee that one of your most pressing needs now was to have scholarships to enable your best and brightest pupils to go on to the university colleges?—It would be certainly an advantage if we had means at our disposal for sending some of our brightest and smartest lads to be educated there.

10464. Have you made any provision for an agricultural library in the county?—Yes, there is an agricultural library in connection with my department, and any farmers' sons who require standard works on agriculture or horticulture can get those works on application. They have a very useful little library also in connection with the cheese school.

10465. Do you find that farmers' sons make use of that?—Not to the extent that I would like.

10466. There is still room for improvement there?—Yes.

10467. (*By Mr. Acland.*) When you said that the boys who attended intermediate schools did not as a rule return to be farmers, for what counties were you speaking? Were you speaking for Monmouthshire or Wales generally?—No, only for portions of the county in which I am living—portions of Monmouthshire, that is.

10468. You were not speaking as regards Wales generally?—No, I am only speaking of the county in which I am living.

10469. And you limit it to portions of the county?—Yes, to a portion of that county.

10470. Are there other portions of Monmouthshire where intermediate students do become farmers afterwards?—There are portions of the county in which they come to these schools in which they are almost entirely the sons of farmers, and where they are likely to remain such; but of those in the immediate neighbourhood of Newport, and those further up the hills, who come down to the intermediate schools, very few of those, even if they are sons of farmers, stick to it.

10471. (*By Mr. Medd.*) Will you kindly tell me how many of the classes mentioned on this paper the elementary school children go to? Which are the classes and the subjects?—Referring to 1906 there is the working dairy school, hedging classes, sheep shearing, and basket making. That would be in the day-time.

10472. Will you complete the list?—Those that I have given to you are classes that have been attended by boys or girls in the day during school hours. Then the Board of Education recognises the giving of instruction in orchards as well.

(*After a short adjournment.*)

10473. You were kindly telling me the classes attended by children from your elementary schools, and I think we had arrived at basket making?—I gave you those that were attended in the day time.

10474. That is during school hours?—Yes. There is also sheep shearing for the boys during the day.

10475. You gave us hedging, sheep shearing, and basket making?—Then I might say that the boys attended the demonstrations and classes that I gave myself in the orchards and gardens during the day as well. That would come under fruit culture.

10476. Are they earning specific grants from the Board of Education for this purpose?—No, they are not.

10477. You have not made any application, have you?—We have not sought to do so. But they have attended those classes, and their attendance at our classes has been recognised as attendance at school in part, so that it has not interfered with the curriculum or caused any friction whatever.

10478. Then with regard to the other classes attended

by the elementary school children, which are they?—They would come up to the poultry classes in the evening, and also to the veterinary lectures given by Mr. Storrar. I think that would be about all.

10479. Then are elementary day school scholars attending classes held in the evening?—Yes.

10480. Are they registered as evening school scholars?—No; we do not do that, because you have to have everything fair and square above board. Our idea in that matter is that those classes should be generally held at the school, and the school master or school mistress, as the case may be, is written to and asked to inform the children so that they may have an opportunity of attending. But I want it to be clearly understood that those children are not requested to attend simply for the purpose of filling up our numbers, and I make it a point that when my visits are made I go to check the attendance, and I also like to notice that there are practically the same children that I have seen on the previous occasions attending. So that we are gradually and quietly but at the same time surely attaining our purpose.

10481. Then have you ever considered the question as to the advisability of inducing any scholars attending at a day school to attend an evening school?—An evening school of what kind?

10482. Of any kind. In other words, do you think it advisable to attempt to persuade by any means children who are compelled to be five hours at school in the day to go to any sort of school at night?—I think they get enough of it during the day. It would be too much of it sometimes.

10483. Do you have continuation classes, that is, what are called ordinary Government continuation classes, in any of these subjects?—No.

10484. Then you are earning grants from the Board of Education for none of this instruction?—In my department we are not earning any money from the Board of Education.

10485. Then have you any Agricultural Education Committee in Monmouthshire?—Yes.

10486. There is a Committee of the County Council, is there?—Yes. Might I explain that my Committee is composed now of 14 members—there are nine members from the Education Committee and five are co-opted from the Chamber of Agriculture. That is so that the agriculture of the county shall be thoroughly and completely represented; and may I assume that our agricultural education is complimented by the Education Committee when they allow my Committee to co-opt five while only three are co-opted by the Education Committee.

10487. I only ask the question because I do not quite understand yet what you mean by the Committee forming in each county to act in conjunction with the Board of Agriculture?—That would be a new committee—a new creation altogether.

10488. But it would be carrying on, would it not, the work of the existing Agricultural Education Committee?—It would.

10489. It would supplant it?—It would be the same committee as far as we are concerned practically, under another name.

10490. (*By Lord Barnard.*) It would be the same committee with a new constitution?—The same committee with a new constitution—I think that is the right way to put it. Mind you, as far as analyses are concerned I do very nearly as much in the way of analysis as the county officers do. As I had some few years ago to suspect that the barley meal that was being sold in the county was not quite what it was represented to be, the same day I had samples of barley meal taken up in every town in the county where it was sold and dealt with.

10491. (*By Mr. Medd.*) Then this committee would be independent of the County Council?—We would have to report to the County Council.

10492. In any case you would desire or approve of the suggestion that these local bodies, by whatever name you call them, should submit annually to the Board of Agriculture a well-defined scheme of the work they intend to engage upon during the entire year?—That is to say, to put it briefly, assuming that my Committee is the new committee, or a committee with the powers indicated by Lord Barnard, that we should submit to the Board of Agriculture each year a scheme of the work we are doing?

Mr. W. J.
Grant.
25 June, 1907

10493. Yes.—Yes.

10494. Of the work to be done ?—Yes.

10495. For approval and suggestions ?—Yes, for approval and suggestions.

10496. Now your work of course I know very well in Monmouthshire, and how excellent it is, but its great difficulty is that you have no permanent institution of an agricultural character. You have no intermediate school of agriculture, or advanced school of agriculture ?—We have not. If it were not for the great number of intermediate schools that have been created the money would have been forthcoming for the agricultural school, but that has been absorbed.

10497. You have exactly hit the mark. There is no money available for capital expenditure upon either intermediate or advanced colleges. You cannot find the money ?—Not for agriculture.

10498. Then the only way to overcome the difficulty is by adjoining counties co-operating and grouping themselves round some intermediate school or some advanced school, so that the best pupils from the counties can go for scientific instruction to the particular institution ?—That is not the position at present.

10499. That is what you would desire, because to-day you have not got it ?—We have not at present got an agricultural school, although we hope to have one.

10500. Nor are you grouped with any other county ?—No.

10501. It would be very desirable that that white area on that map there should be covered with institutions, or that institutions should be available for that purpose ?—It would be desirable, as at Cirencester.

10502. You are not affiliated ?—No, and I think if Cirencester was placed in the position, that it ought to be, financially with regard to agricultural education, we could use Cirencester with advantage.

10503. That is what I have felt ; that with regard to the higher branches of scientific instruction, it would be greatly to your advantage to be in combination with Gloucestershire in such a way as to enable your best pupils to go to Cirencester for instruction ?—It would be an advantage undoubtedly.

10504. Because you cannot to-day maintain and support an institution of that type yourself, and have not got the capital for that ?—No. I venture to think that unless we had sufficient and adequate funds at our disposal it would be suicidal to start it.

10505. If you had such an institution as Cirencester available, it would be an equal pity not to use it ?—Absolutely so.

10506. Then you will agree with me very likely that if possible we should get Monmouthshire, Gloucestershire possibly, Herefordshire and Somersetshire grouped round Cirencester for the purpose of higher agricultural education, like the rest of the map which is grouped round these centres. It would be a great advantage ?—It would be a great advantage to these counties.

10507. (By Lord Barnard.) You did not refer at any length to the subject of forestry, but since speaking to you I have been looking at the Board of Agriculture's publication, and I find that you have a very considerable proportion of the area of your county under wood ?—We have in the county.

10508. A larger proportion than a great many other counties ?—That is so.

10509. Ninety-two acres per 1,000 ?—Yes, that is so.

10510. You have a very considerable area of wood, therefore ?—Yes.

10511. Are there very many men employed in those woods ?—The woods in Monmouthshire are mostly what you would term coppices. I have been digging and

digging away since I have been there endeavouring to get something done in the way of forestry, and I have made very little of it as yet. Some years ago I surveyed a fairly good-sized colliery property in the hills and I advised them as to what to plant, when to plant, and how to plant, and gave an estimate of the cost and everything else ; but that was the beginning and the end of it. It went no further, but I think I may say this much, that if we had the means at our disposal even now we should make an attempt to do something in the way of experimental planting with regard to forestry. A great many thousand pounds are spent every year in pit wood in Monmouthshire, and a great many thousand pounds worth of pit wood might be grown in the county if we could only persuade the people to begin. There are many thousands of acres of hill land where it might be done with advantage.

10512. Amongst the many subjects connected with manual processes in which you give instruction there has been instruction of that kind, has there ?—Yes, and I give advice more or less each year as to the planting of woods, and I have advised as to the trees and so on.

10513. Is there any instruction given as to measuring timber ?—No ; that I have not touched.

10514. (By Mr. Acland.) Is there any demand for technical education for foresters, or people who want to become foresters on big estates ?—Not in Monmouthshire yet, but the time is coming when foresters will have to be provided and trained in forestry.

10515. (By Lord Barnard.) You know what is being done in regard to agriculture in that respect ?—Yes.

10516. And you think that should be taken up in your county ?—Yes. Then there is one other matter that I did not allude to in my evidence generally with regard to assistance to horticultural and agricultural societies. In addition to either myself or members of the staff judging stock or produce, or whatever it may be that is exhibited, we make a point as far as possible to offer prizes for butter, poultry, cheese, eggs, fruit, potatoes and so forth at those gatherings, that have been produced by those who have attended our classes, with a view of encouraging them to continue the production of the best articles, and also to keep the articles that they produce continually before the public, and we find the money spent in that direction has had a very very good effect indeed. My Committee are responsible for an increased production of fruit in Monmouthshire, and I may say we have improved the packing of fruit and other produce very much in the county, so as to induce the people to put everything they have to offer before the public in the most tasteful manner possible.

10517. Could you furnish the Secretary of the Committee with a little more information as to the finances of the County Council ? The money which you have stated to-day you have spent does not represent more than the charges on the rates or on the public funds ?—The money that you see indicated there is the money that has been actually spent each year.

10518. But you have spent more than that, I gather, only you recouped yourselves some of it by fees and sales ?—The money that is indicated there to the best of my belief is the money that has been expended, less the amount received from sales and fees.

10519. Now what I should like you to inform the Secretary of this Committee on is the total amount that you have expended in the last three or four years on agricultural instruction. You may put on the other side if you like anything that you get back ?—That I will do with pleasure, but I cannot do it from memory. If I may say so, the figures that I have here are taken from the audited accounts by my clerk, and I have every reason to believe they are absolutely correct.

10520. That is the net expenditure ?—Yes.

10521. What I should like you to put before the Committee is what the total expenditure is ?—For that matter if you wished it, I could have given you the actual cost for everything in connection with the classes, but I thought I should weary you with detail (see p. 387).

The Witness forwarded to the Secretary a statement which may be summarised as follows :—

STATEMENT SHOWING THE RECEIPTS AND EXPENDITURE OF THE MONMOUTHSHIRE AGRICULTURAL EDUCATION COMMITTEE FROM JULY, 1891, TO MARCH 31st, 1906.

Mr. W. J.
Grant.
25 June, 1907

PERIOD.	RECEIPTS.				EXPENDITURE.
	Amount Allocated.	Fees.*	Sales.	Interest.

* No fees are charged except those of the dairy school and some, but not all, of the shoeing classes, but where an entrance fee, not exceeding 2s. 6d., is required at a shoeing class, these fees are paid to the local committees towards the cost incurred by them in making the necessary arrangements for the competitive examinations.

The HON. CHIEF JOHN A. COCKBURN, K.C.M.G., called and examined.

10522. (By Lord Barnard.) I think you know the terms of the reference to this Committee?—I have read them.

10523. You, I understand, have been Minister of Agriculture in one of our great Colonies?—Yes, for many years I organised the Department of Agriculture in South Australia.

10524. You were Premier at one time?—Yes.

10525. Are you Agent-General now?—No, but I was for three years.

10526. It would be of great value to the Committee if you could give your opinion very generally on the subject which is referred to them by the light of what took place within your knowledge in South Australia?—We are chiefly interested in seeing that everything is done in the way of inculcating the principles of the science of agriculture in the minds of agriculturists and of the public. The science of agriculture is of primary importance to all Australian colonies. Early steps were taken in every grade of education to teach agriculture. Of course some mistakes were made. For instance, we started by introducing a text book into the schools. But I do not know whether you wish to know what took place in regard to the primary schools.

10527. We are not considering that, but if you consider it essential to any point in connection with agricultural education I should be sorry to stop you?—If the foundation of it is not laid in the primary schools it is difficult to connect it on later. Briefly I will say what was done in the primary schools.

10528. You are aware, I dare say, of the sentiment which has become very prevalent in this country at the present day in the rural districts, that if you are to keep the rural classes in the rural districts you must give them what has been described as a rural bias in the elementary schools?—Precisely. And that is our feeling too, in Australia, because there we have city crowding very much intensified, as all the characteristics of the race are intensified in the Britains beyond the sea, and it is partly to give that bias or bent towards country life that we are very solicitous to commence in the plastic years; but the first step taken was a wrong one, as I say. We attempted to teach agriculture by means of text books. Very soon after I became Minister of Education I endeavoured to introduce some practical information with regard to the soil generally. The first step I took was to introduce an Arbor Day, which has had some effect in Australia in fostering an interest in the land. I introduced Arbor Day in 1886, soon after it was started in the United States. Then an Order in Council was passed which provided that all country schools in future were to have a certain number of acres reserved around them for school gardens; then we

gave special inducements to teachers to teach practical agriculture, and in many of the schools throughout Australia the children are taught practical agriculture on the ground around the schools. This is done under the title of manual training. In Queensland all the manual training in the schools practically takes the form of practical agriculture. In South Australia the greatest latitude is allowed to the teacher in that respect, and he may teach woodwork or ironwork, or carpentry, or some of the forms of agriculture, and many of the schools do take up practical agriculture and perform quite an extensive series of operations. They go so far as to hybridise wheat, and to find out the best forms for the particular locality. Then there are the Government experts in Australia. We have a number of experts in the various staple industries, in agriculture, and viticulture, and fruit culture generally, and these experts visit the primary schools. In New South Wales there is an instructor in agriculture whose special duty it is to visit these schools and give instruction to the teachers as to the best method of giving practical lessons in agriculture and managing school gardens and so forth. Then we have agricultural colleges and high technical schools, but our school age terminates some two years or so before the age of admission into these technical schools, so I endeavoured to bridge over that gap by establishing secondary agricultural schools in South Australia, the chief feature of which was that only half the time of the school day was to be devoted to class-room work, and the other half was to be devoted to field work and work in the garden, and in the workshop, and in the laboratory. I am sorry to say that system did not extend so much as I expected. It has not been prosecuted with any great degree of vigour since I left South Australia; but the school that I started in Adelaide is flourishing and is used as a preparatory school for the School of Mines and Industries on the one hand, and for the Agricultural College on the other. The boys go there from the age of 13 to 15 and get a thoroughly good practical education, with a certain amount of literary education as well. But the focus of the school is in agriculture and in the workshop, and not in the class room. Then, of course, we have our agricultural colleges. Most of the States have agricultural colleges. I do not know whether you would care to know the typical curriculum in one of these colleges, or whether it is a matter that goes without saying all over the world.

10529. Perhaps you would give us that briefly.—The curriculum at Hawkesbury, in New South Wales, which is a very large and successful agricultural college, is agriculture, agricultural chemistry, botany, meteorology, entomology, engineering, bacteriology, surveying, applied mechanics, book-keeping, veterinary work, horticulture, dairy work, carpentry, blacksmithing, sheep and wool, poultry, live stock, pig raising, curing, &c. Most of our

Sir J.
Cockburn.

10528b

10528c

10528a

Sir J.
Cockburn.
25 June, 1907.

10529a

colleges have a similar curriculum, taking up a number of subjects. The departments in the agricultural college in South Australia are agriculture, horticulture, viticulture, and dairying, and in connection with the College there is a model vineyard, and a model cellar, and wine is made there, not to be consumed on the premises, but to teach the students all the operations connected with wine making, which is one of the great industries in Australia. These colleges, as a rule, are affiliated to the universities, and degrees in agriculture are given now at several of the universities. In South Australia the degree of Bachelor of Science may be taken in agriculture, and in that case the students who aim in that direction spend two years at least at the agricultural college. Victoria also has just instituted a degree in agriculture. Of course there are scholarships that are given at the primary schools which are available at the secondary schools, and then there are scholarships at these latter schools which are available at the colleges.

10530. So that so far as agriculture goes it is complete ?
—Yes.

10531. An intelligent boy has every means of pursuing his education to the utmost extent of which he is capable ?—Yes. There is nothing technical that he cannot compass in that way. Nearly all these colleges are residential. They are in country districts, and most of the students are intramural. The average age of entrance is 16. The average fees are £30 a year including everything, with the exception of washing. In some schools medical attendance is also included.

10532. What class of people attend these colleges ? Are they people who have been brought up in the country more or less, or are they townspeople who wish to take to agriculture ?—It is rather difficult to get scholarships taken up in some of the country schools, but there is a fair number of boys from the cities.

10533. But the agricultural community are the principal people who take advantage of them, are they ?—Yes ; I think I am justified in saying that.

10534. Do those students who do not take the degree to which you refer pass an examination at the end of their course ?—Yes, they are required to do so.

10535. Do they get a certificate ?—They get a certificate, or they get the diploma of the college. But of course only a few go on to their degree. Those who go for the degree go to the college expressly to get the degree.

10536. Probably those who go for the degree would not become ordinary agriculturists or every day working agriculturists ?—No, they would not. Many of them would look forward to becoming experts. We employ a large number of experts ; because the State in Australia does not regard its functions as so strictly limited as in some countries, and we do not think it is beneath the dignity or the province of the Government to take any action which may be for the welfare of the community. Therefore, we do a good deal in the way of opening and developing channels in trade, and we have a number of Government experts who inspect the articles that are intended for export. We have a great variety of agricultural products for export, and therefore there are a number of positions available, and I think these graduates would rather aim at those, or at some special branch, such as viticulture or fruit-growing, rather than at the ordinary farmer's life.

10537. But the other boys who go through the secondary schools I suppose go on the land, do they not, to a certain extent, and become agriculturists and farmers ?—Yes, a fair number of them do, but we have the same trouble with the people in that respect as here.

10538. What amount of Government money is expended on those colleges ?—There are none of them self-supporting so far as education is concerned. They are self-supporting so far as their farming operations are concerned. The vote for the South Australian College is £5,000 a year. There are 70 students, and the fees amount to £1,750. So that there is the difference between £1,750 and £5,000, which is made up out of the general revenue. At Hawkesbury the fees amount to about £3,000. The Government subsidy is about £9,000 a year, and there are 200 students there. We do not consider that a fee of £30 pays expenses.

10539. Are those purely agricultural colleges, or are they for general instruction ?—No, those are agricultural colleges. Of course there are technical schools outside those, and they give a certain amount of instruction in agricultural subjects, such as wool grading and subjects of that sort.

10540. You do not know whether the instruction that

you give in these colleges and schools includes marketing produce in any way, do you ? For instance, there is a large export trade in agricultural produce in some parts of Australia, I suppose ?—Yes.

10541. Is there any commercial instruction given ?—Instruction is given in book-keeping as applicable to farming. There is a farming class, in which the students are taught all the various branches of knowledge which are useful to the farmer, but I am not aware whether any special stress is laid upon the marketing point.

10542. (By Mr. Latham.) You pay special attention to ensure that everything shall be pure, I take it ?—Yes. There is a rigid Government inspection for instance, the wine going from the export depot has to be certified as pure, and is examined for any adulteration. Adulterated articles would be immediately rejected, and we are very stringent in that matter. Then chemical manures that are sold by private firms are subject to analysis, and important ingredients, such as the amount of soluble ammonia and so forth have to be clearly stated.

10543. (By Lord Barnard.) Are the agricultural classes in South Australia satisfied with what the Government is doing on their behalf, or are they fairly satisfied, or are they pressing for further assistance ?—The Government is very much in the hands of the people in Australia, and the Government has at once to order itself according to the wishes of the people, so that the very fact that the Government is there proves that there is a fair degree of satisfaction on the part of the constituencies. Then in addition to the colleges there is a good deal done in the way of giving instruction to farmers. There are agricultural bureaux which disseminate all the latest information with regard to agriculture and send out particulars of all the newest varieties of wheat and seeds to farmers for trial.

10544. To the actual cultivating farmer ?—Yes, but only in samples of course. Then the experts, as I have said before, visit the centres. In Victoria an expert will go to an agricultural centre and take up his abode there for a month or six weeks, and during that time he will give lectures on his particular branch of study, and he will go round to the individual farmers. Any farmer, any viticulturist, or any fruit grower in Australia can practically have the services of the Government expert by writing to the Minister of Agriculture, who arranges that the next time the expert is in that neighbourhood he will go to the farm and advise as to the best means of combating a pest or discovering what may be wrong with a vineyard or orchard or flock, or anything of that sort.

10545. In South Australia is that all governed by the central Government, or does the local government take any part in it ?—It is all done practically by the central Government. There are local bureaux, but the expense comes out of the Treasury chest.

10546. As to the control of these local bureaux, are they controlled by the central Government or are they in the hands of the local centre ?—They are appointed or approved by the centre. Proposals have been made for a system by which they would be more representative of the locality—more elected by the people in the district themselves, but the matter was not taken up with the eagerness that I expected.

10547. Are there any other points that you wish to touch upon ?—No, I think not.

10548. (By Lord Moreton.) Will you tell us, as regards the elementary schools where there is agriculture taught, how the teachers are taught agriculture ?—That question reminds me of a difficult problem we had in the old days—who will teach the teachers ? I found it was more a theoretical than a practical difficulty. I instituted classes and got the Government experts on Saturdays and during the holidays to take classes of teachers, and they were taught how to prune and to bud, and all these various operations, and I was surprised at the facility with which men of general education who were eager in the matter would pick up quite sufficient information for them to be able to give the instruction necessary in the schools. I was quite surprised at it. After a very few practical demonstrations they really became quite efficient.

10549. (By Mr. Acland.) Will you tell us now, or let us know afterwards, the number of pupils now in the State colleges and the expense falling on the State for the maintenance of those colleges, so that we can see the sort of expense it is to the State per head of the pupils in the agricultural colleges ?—I can give you the figures for Hawkesbury in 1905. The number of students was 200,

Sir J.
Cockburn.
25 June, 1907.

the Government subsidy £9,232, and the fees £32 9s. for resident students; they include medical attendance in that case, and amount to £3,009. But I can furnish more detailed information on that subject afterwards, if desired.

10550. I thought if it would not be too much trouble to you it might be interesting to us to see what is the total expense, taking the colleges, which falls on the State per student?—That may be taken to be a fair sample which I have given. You would have to take the £3,009 from the £9,232 and divide by 200. That is for the year 1905.

10551. So that the State grant would be roughly £45 per student?—No; the students' fees have to be deducted.

10552. The total income is £9,232?—That is what the Government pays.

10553. What becomes of the fees?—They go towards the expenses.

10554. They go to the Government?—Yes. So that that leaves £6,000 to be divided by 200. That appears to be roughly about pound per pound on what the student pays. But I will check that by more extended figures. I think the South Australian College comes out somewhere near the same figure.

10555. (By Lord Moreton.) Can you give us any idea as to how many weeks of teaching the students get at the agricultural colleges? Would that be about the same as in England?—I do not think there are such long recesses as there are here. But I have not got that at the tip of my fingers. I could furnish information as to the length of college terms, if desired.

10556. It is as to how many weeks in the year they are taught?—I understand.

[Sir John Cockburn subsequently informed the Secretary that "in the Victorian Colleges there are two Sessions in the year, the first from about the second week in September to about the third week in January, the second from about the third week in February to about the first week in August. In South Australia there are three Sessions, viz., approximately—(1) Third Wednesday in April to third Friday in July. (2) Second Tuesday after close of first Session to second Friday in October. (3) Second Tuesday after the close of the second Session to the completion of the vintage."]

10557. (By Mr. Acland.) Have you come to any conclusion as to what is the best educational course for students going to these colleges. Should it include, for instance, ordinary secondary school education, or a secondary agricultural school education?—I have no belief in the curriculum of the secondary school except in so far as it is necessary for boys going on to the university standards.

10558. You do not account these colleges as on the level of universities?—The best secondary education is that where half the work is practical. I do not believe in a school which is limited to classroom work. I do not believe it does the best that can be done in developing even the general intelligence.

10559. By the expression "secondary school" I was not ruling out the school at which part of the curriculum should be practical. But when you said practical, did you mean definitely directed to agriculture, or practical in the general sense of manual instruction and so on?—Practical in a general sense—taking surveying, workshop instruction, practical chemistry and practical gardening.

10560. But do you believe in a different sort of secondary school training for those who are going on to these agricultural colleges than for people in town who may be going on or not going on?—Different from the ordinary secondary school, do you mean?

10561. Yes.—I do not think the ordinary secondary school in Australia, or elsewhere, on the usual stereotyped line is the best preparation for entrance to an agricultural college.

10562. You believe in isolating as a special class secondary education for those who are going in for higher education in agriculture?—No, I do not want to do that if it could be avoided, because I believe that the education which is the best for an agricultural life is also the best for any other form of practical life. But at present our secondary schools are dominated by the university standard, and if a pupil is going on to pass his degree and wants to take a scholarship, he must conform to the subjects that are set; unfortunately it seems to be difficult to get the schools to recognise the fact that that end could be served just as well if half the time of the school were given to practical life. Even for the abstract work which the university demands, I maintain that if half the time

is given to practical work, the progress in the more abstract studies would be as great or greater.

10563. Have you got a system in these schools suitable for persons going to pursue practical life, and subsidiary to these colleges?—No, not yet.

10564. But do you regard that as a very important thing, as tending to the success of the higher agricultural education?—Extremely important.

10565. Are you not rather working in the direction of getting general practical secondary schools?—When I left South Australia I had hoped to see these schools established on the model which I was speaking of, throughout the whole of the State, but so far that has not been done.

10566. Do you regard that deficiency of the general practical secondary education as a great deficiency?—Yes, very great. Some of the secondary schools are doing something in the way of remedy. They have manual training now in those schools, but I should not be satisfied till half the time is devoted to practical work.

10567. (By Mr. Latham.) I think you are convinced that there scarcely can be too much done for agriculture?—Certainly not in our community, because we depend practically for our existence as a country on agriculture.

10568. So far as you know of our own country, do you not think very much more could be done for agriculture than is being done?—I am inclined to think so. Our farmers manage to make a living although they send their produce 10,000 miles or more to market. If some of them had a few acres in some of the counties which are near this great market, they would not find it so difficult to make a living. If men only knew more of the best way to turn the soil to advantage, they could make farming very much more successful than they do.

10569. You have answered Mr. Acland on a point on which I myself feel very strongly as to practice being practically half the education. Do you think half is enough?—I say I am aiming at half. I think half a loaf is good enough at present.

10570. But if a man could have a little science and be thoroughly practical, do you not think that he would get a better living than if he were very scientific and not so practical?—Yes. If I had my way in education the class room would be merely the adjunct to the fields and workshop. The explanation of processes should be given after they had been witnessed by the student. There is then a desire to learn the reasons of any particular operation. A student has no interest in science or theory first without practice.

10571. Your Government is very strict with regard to all the adulterations of those products, and is strict in desiring that they should be free from adulteration, and that is carried out entirely by the State, is it not?—Yes.

10572. But the scientific part of that education has nothing whatever to do with a farmer's life, has it?—No.

10573. Now would it not be better if it had to do with it?—I do not quite follow the question.

10574. Supposing you could educate your farmers scientifically enough to be able to prevent adulteration, would it not be much better than that he should go to the State? Very few farmers are scientifically instructed enough to know what this adulteration means, especially alluding to your wines?—I do not think so far as adulteration of wines is concerned, it is an unconscious process. I am afraid it is sometimes done on purpose not by the farmers but by others; it is the Government's business to see that it is not done.

10575. But they cure rather than prevent?—Yes.

10576. What is the status of those farmers in Australia? What sort of man is the agriculturist there?—They are usually not the type of farmers common in England, or still more so in Scotland. The farmer as a rule in Australia is a man who, though he is well educated, and in many cases a man of culture, works hard himself manually. We have few farmers, as in the Lothians, who are really the governors of large domains, as it were, and have frequently only the superintendence themselves to do.

10577. They have not the time that our farmers have at their disposal for education, have they?—They work a great deal harder than the farmer does in this country.

10578. But if you do not get them tolerably young, there is not much use of their getting this education in after life?—No, there is not much opportunity afterwards.

10579. How late is the education possible in Australia?

Sir J.
Cockburn.
—
25 June, 1907
—

The farmer's son I have heard begins his work rather early. What do you say about that?—The boys begin their farming education, if they are the sons of farmers as soon as they begin to run about. They are learning something all the time they are out of school.

10580. About what age do they go to these colleges?—16 is the minimum age.

10581. How long are they kept there?—From 16 or 17 to 19 or 20.

10582. That means that they principally go in for the long course and not the short course of training?—The ordinary course is for two years.

10583. You really have no short courses such as we have had advocated in England?—Yes; that is just starting. I am glad you reminded me of that. They are starting the short courses in some of the States, where farmers can go for a few weeks or where farmer's wives can go for a few weeks to learn scientific and practical dairying. At Hawkesbury they have established winter schools for farmers for a course of four weeks, when there is less doing on the farm than usual. These schools are designed to assist men on the land who desire to increase their technical knowledge in agriculture and live stock, but who are unable to leave home for a more extensive course. The charge for the course is two guineas, board and lodging included. The railway fares are put at a single fare for the double journey. The course embraces a variety of subjects and those attending receive special attention on the subject they most desire to learn.

10584. Are they taken up?—Yes. They have been just started, and I was reading about them in a paper that arrived from Australia yesterday. This is a new departure, but I have not the least doubt from my knowledge of Australia, it will be very largely availed of.

10585. How far do you give your agriculturists the advantage of experiments?—There are experimental farms scattered throughout the country, which the farmers frequently visit, and in some of the States certain farmers are selected who are supplied with all the latest varieties of cereals and seed on condition that they will plant these in separate plots and cultivate them in the most approved style, and demonstrate to any of the farmers who choose to visit the land.

10586. Do they report back to the centre?—Yes.

10587. That is how their information is sown broadcast throughout the land, is it?—Yes.

10588. Do you get many farmers who will take it up?—Yes, I think very many are quite willing to do the work. They are asked to do it by the Agricultural Department.

10589. I think we may take it for granted that all the agricultural education given in Australia is valued?—Yes; undoubtedly these agricultural colleges are very popular. As a rule the vote is passed through the Estimates in the House of Assembly without much objection.

10590. (By Mr. Davis.) With regard to the colleges you told us about, can you tell the Committee very roughly what proportion of farmers' sons of any particular county or district attend these agricultural colleges?—No, I must get that information.

10591. Should you say roughly 50 per cent.?—No, I do not think it used to be as high as 50 per cent.

10592. Nothing like it?—No, I should not say 50 per cent. But I do not like to say. I do not know whether there are any statistics which deal with that subject, but I will make a note of it and let you know. The proportion has increased of late years.

[The witness afterwards wrote, "I have made enquiries from the most competent sources available, and I find that the proportion of farmers' sons at the agricultural colleges is estimated at about one-third in one case and about 50 per cent. in others."]

10593. You think public opinion, especially in agricultural areas, is setting in favour of the fact that farmers should send their sons for higher agricultural education to these colleges?—Yes, it is. There is an increasing feeling in that direction.

10594. Then I think you told the Committee that the agricultural colleges were affiliated to universities?—Yes, in many cases.

10595. In your opinion is it best that the agricultural college should be isolated in the particular county or district, or that it should be closely connected with, or, in fact be a department of the university college—that it should be really a department, or part and parcel of the university college?—None of the Colleges I have mentioned are in close proximity to the universities and I doubt if it would be well that they should be. I do not think I should favour their being merely departments managed by the ordinary university authorities. My experience of technical education is that it is better to have an independent management—that the university traditions do not seem to lend themselves to teaching technical subjects so well or so practically as the colleges erected specially for that purpose. The universities are or have been unfortunately rather given to theoretical courses, such as teaching applied mechanics in the classroom, and so on. I think they are very rapidly mending that, but still I should be sorry to see an agricultural college put directly under the management of a university authority.

10596. Or even partially being responsible to the county area or the particular district. As you will see from that map there, there are a great many agricultural colleges in this country which are connected with university colleges, and carried on partly by the county and partly by the university college?—I think that is very good indeed. The university element in the education would be very good I think if there were other elements in the administration. I think it is a great advantage to have a certain amount of university influence on the board of management.

10597. You think that they should be part and parcel of the university buildings, for instance in chemistry and botany and that sort of thing, or the scientific side generally?—Yes, so far as the purely science courses are concerned.

10598. And that the students should reside in the university and mix with the other men who do not go in for precisely the same work?—There is great advantage in that. There is general all-round growth with every branch of education in which students are brought into contact with other than those of their own speciality, but I would not like to place the technical colleges entirely under university control at present, although it is a great advantage to have a certain number of university men on the board of management.

Mr. P. ALLTOFT, called and examined

Mr. P. Alltoft.

10599. (By Lord Barnard.) You are, and have for many years been acting as instructor in manual processes; under what County Councils?—Lincolnshire and Wiltshire.

10600. But there are three administrative counties of Lincolnshire, which one is it?—East Lindsey.

10601. You have also since 1902 occupied a similar position under the County Council of Wiltshire, I believe?—Yes.

10602. Would you just tell the Committee what you were before you commenced this work of instructing?—An agricultural labourer.

10603. In Lincolnshire?—Yes.

10604. You had a special aptitude for certain manual processes of agricultural work?—Yes.

10605. Which one in particular?—I take it to be all of

them. I was taught the highest degree of all kinds of skilled agriculture.

10606. Where did you come from actually?—Tetney.

10607. Did you win prizes yourself for these processes?—Yes.

10608. Then the Lindsey Division of the county engaged you as an instructor?—Yes.

10609. How many classes do you hold and how long do your classes last?—About five days each.

10610. How long does each day last?—From 8 o'clock to 4 o'clock, as a rule.

10611. That is the working day?—Yes.

10612. We should like to know exactly the various subjects upon which you give instruction. Is hedging one of them?—Hedging and ditching.

Mr. P. Allott.
25 June. 1907

10613. Is that one?—That is two.
10614. That is there are separate classes for that?—We combine the two together.
10615. Now give another one?—Ploughing.
10616. And others?—Thatching, rick making, sheep shearing, under-draining and farm machinery. Those are the subjects that I teach.
10617. As a rule, what is the kind of number you have attending each class, who come to you for instruction?—It varies from six to ten.
10618. What is the maximum you could teach, do you think, successfully?—About eight—not more than eight.
10619. You ought not to have more than eight?—No.
10620. Taking hedging and ditching for instance, do you get some farmer or does the County Council get some farmer to let you go on to his farm?—Yes.
10621. Then do you actually do a bit of hedging yourself first, or how do you do it?—Yes.
10622. Then do you make the pupils do it after you?—Yes.
10623. And you tell them what they do wrong, I suppose?—Yes.
10624. And the same with the other classes I suppose?—Yes.
10625. Do you know from your own experience at all whether the results of what you have done is appreciated by the men?—I do know it.
10626. Do they tell you so themselves?—Yes.
10627. And do the farmers tell you so?—Yes.
10628. Do the farmers think the man is worth more after he has been through your hands than he was before?—Yes, and they give them more.
10629. Does what you have said now apply equally in Wiltshire and in Lincolnshire?—Yes, it applies in both counties.
10630. Do you find the customs of the country differ at all, as to hedges for instance?—Yes, very largely.
10631. Do you apply your Lincolnshire practice in Wiltshire?—Yes.
10632. And the farmers do not mind it?—No, they like it well.
10633. You have got your own views on the subject of how this can be further extended, have you?—Yes, I have.
10634. Would you tell me what you think of it and how it can be improved?—By appropriating a little more money.
10635. How would you expend that money if it were appropriated?—I should expend it in the same way as it is expended, in trying to teach the best processes.
10636. Do you mean by having more teachers?—No, I do not know about that, but I think there ought to be a Government grant given to them.
10637. But what should you do with the Government grant when you got it?—I should expend it in classes.
10638. Then the expense must be rather small, must it not, in organising the class?—I do not know that. We have always been short of money.
10639. How do you spend the money?—In giving them help. Up to the 1st of April each man for his services received 7s. 6d. if he has not got a county prize. There was a first prize given by the Agricultural Education Committee of Wiltshire of 25s., of 15s. for the second prize, and 7s. 6d. for the third, if the judges highly recommended it. Since the 1st of April the 7s. 6d. has been taken off, simply because they had no money. The general education rate takes up all the money.
10640. You have been on the land all your life, have you?—Yes, ever since I was born.
10641. Supposing for instance these classes were all stopped, and hedge making were to go back again, do you think it would be a very bad thing?—Yes, I do.
10642. Putting it the other way round, you think it is a good thing for the farmers and their men if the improvement of hedge making still goes on and is extended?—Yes.
10643. I fancy there are a good many bad hedgers in the country still, are there not?—Yes, there are. There is plenty of scope for more work.
10644. Have any of your former pupils become teachers?—Yes.
10645. I should think there is an opening for a great number of extra teachers, is not there?—Yes, there is quite as much scope for teachers to-day as before. There are a lot yet who have not got to know it.
10646. Do many men attend your under-draining classes?—Yes, they are very extensive, in Lincolnshire, particularly, but of course in the south of England it is going out to a very great extent.
10647. Draining is a very important subject all the same?—Yes, one of the most important subjects. One of the first things that I always look at on a farm is to see how the man's hedges are cut, and his drains, and whether he has got some good ditches.
10648. (*By Mr. Acland.*) What is the class that comes to you for these classes? Are they agricultural labourers?—Yes, and the waster as well sometimes.
10649. Do they come in order to get these prizes?—No, I do not think so.
10650. Do they come then because the farmers send them?—No, I do not think they do.
10651. They come of their own accord to improve themselves, do they?—Yes, I think so.
10652. How are those classes organised? Are notices sent round to the farmers, or how?—By bill-posting as a rule. There is a notice put up, on bills announcing that certain classes will be held in a certain district, provided pupils are forthcoming.
10653. Then do you go on the appointed day and see who turns up?—No, I do not go at all unless there is a class organised.
10654. Then there is some local person who gets the names?—Yes.
10655. Does he put this up on the bills: "Application to be made" to such and such a person?—Yes.
10656. I should like your opinion about thatching. One often hears that thatching as an art is dying out in the west of England?—Yes, it is very largely dying out.
10657. Do you think that is because other forms of covering houses are now cheaper, or because for one reason or other the skill has died out?—The skill, I believe, has died out.
10658. You think that thatching is still as good a means of covering as ever it was?—Yes, quite as good. I live in an old thatched cottage myself, and I would not exchange it for any mansion in England.
10659. You believe that thatching might be a good deal restored if only people were properly taught?—Yes, I do.
10660. (*By Mr. Latham.*) How did you get your education first of all?—From my father.
10661. Not from the person that employed you?—No; I got it from my father.
10662. Do you find that in England the farmers themselves cannot teach agricultural processes?—I am afraid there are a great many of the younger gentlemen who cannot.
10663. Can you tell me why that is?—Yes, I can, to a certain extent. I think it is because they get the theory part without the practice, whereas a man should always know the why and the wherefore before he can tell you the theory of a thing. I think that is where the mistake is made.
10664. How often do these classes take place?—I commenced in Wiltshire on the 1st of September last and I continued the classes till the 1st of March.
10665. I see in the official report that you are marked "partially employed"?—Yes.
10666. What do you do when you are not teaching?—I go upon the farm again to-morrow morning. I have no instructing work on at present, so I go back to work on the farm.
10667. In Wiltshire?—No, in Lincolnshire.
10668. Then you are not absolutely and entirely in Wiltshire?—No.
10669. What part of your time are you in Wiltshire?—All over the county I am part of my time.
10670. But what part of the time are you in Wiltshire at the present time?—I went on the 1st of September, and continued there till the 1st of March, and now I have just been back again for a fortnight. The first classes are in sheep shearing.
10671. That is why I asked you the question, because hedging and ditching is winter work?—Yes.

Mr. P. Allott. 10672. And sheep shearing and thatching is work for summer?—Yes, we take thatching, as a rule, from about August into September, and then we commence ploughing and go on with it, say, till December. Then I take up hedge cutting in January, February, and March, or under-draining, or whatever might take place during that time.

10673. What portion of the work of ploughing do you teach them in?—Both the theory and the practical part.

10674. But what part of the practical is it?—How to set the plough.

10675. What part of the practice of ploughing do you teach these agricultural labourers?—I teach them how to set the plough and how to use it when it is set.

10676. Are they so ignorant in Wiltshire that they have never yet learnt how to set a plough?—I should not like to say they are any more ignorant in Wiltshire than in any other part of the world, but there is an ignorant class of people to be found all over.

10677. We have had ploughing matches all over England for many years, and I thought ploughing was a thing pretty well understood by the agricultural labourer?—No, I do not think so. There is plenty of room yet to teach a man the different kinds of soils, and the depth he should plough in them, and how deep he should plough for certain crops, and all that kind of thing.

10678. Is it really a fact that our agriculturists are not able to teach their men that?—I am afraid a great many are not.

10679. Now, with regard to thatching, is there any disinclination on the part of the young men to thatch, or is it that they do not understand the business?—The fathers have not taught the sons for some time now. It is a matter for the agriculturists themselves. They think that if they teach anybody else they will take away their livelihood. There is a feeling of that description.

10680. But is it so bad as all that from father to son?—Yes, I am afraid it is from father to son to a very great extent.

10681. You say that after you teach these men you think they are able to earn better wages?—Yes.

10682. That is by taking up the business you are teaching them?—Yes.

10683. You do not make the father earn better wages?—No, I have never tried that. My experience is with younger people.

10684. That is to say you do not improve the business any more than that you make these young men earn better wages?—Yes, I think so. I think it makes the old ones more wide-awake, or they will lose their work.

10685. Is there any feeling against your teaching?—No, I have not heard of any.

10686. What machinery do you teach them?—Steam traction engine, ploughing engine, or threshing machines, or any kind of farm machinery except electric, which I do not know anything about.

10687. Do you teach them to take these machines to pieces and put them together again?—Yes.

10688. And repairs?—Yes.

10689. Are you a sheep shearers yourself?—Yes.

10690. And you can find people coming to you to be taught sheep shearing?—Yes, I had 10 in my last class.

10691. What ages were they?—Varying from 19 to 24.

10692. Had they been previously shearers?—Never sheared before.

10693. Then we may take, I suppose, that by instituting these sheep shearing classes you made 10 extra shearers?—Yes. Of course if there are no extra shearers coming in they keep dying out. In Wiltshire they take on one after two or three years, and give them a certain portion of what he has earned, but not possibly all he has earned, and by doing so they do not get them to join very readily, as in years gone by.

10694. That is very unfair to the workman, is it not?—Yes.

10695. That is not exactly the fault of the actual business of sheep shearing so much as that the man does not get all he earns?—No, I do not think he does, and, therefore, they do not care to take it up.

10696. But that is a very unusual thing really, is it not?—No, I do not think so. I find it very prevalent.

10697. It is quite a new experience to me to find that

there is any part sharing in profits if these men are shearing in gangs?—Yes, there is.

10698. Are not they paid so much the score?—Yes, they shear at so much the score. But if you are a practitioner, that is to say, if you are a perfect shearer you would not want to give your next door friend so much who was not so good.

10699. Supposing the men cut the wool of 20 sheep I could understand your argument, but if one did 18 and another 20 sheep, one would have 18s. and the other 20s.?—No, they only give them so much out of the gang a day. It matters little what quantity they do.

10700. Then the ganger, I take it for granted, takes the shearing, and has all the money in his own pocket, and hires these men at a certain wage, and they receive the money from him?—No, I do not mean to say that.

10701. Then I do not understand you quite?—My meaning is this; provided there are eight or ten in a gang, which there is about as a rule, if they have got to take on a new hand because an old one dies sometimes, they will possibly give that one 2s. 6d. a day out of the gang, and the others will share the remainder amongst themselves.

10702. I can understand that, because if a man is a new hand he will scarcely expect to keep up with old ones in all probability, and 2s. 6d. would be all he would earn?—Yes, it might be so in the first year, but John in the course of years gets better than Jack, and the old man does not want to suffer or take less. He wants to take the same as John.

10703. But that man gets to be a better man and receives his due reward?—Yes, but still I see no equality about that.

10704. But it is after all only a matter of a fraction?—It is a thing I know from experience in everyday life that the good man gets no more than the bad one.

10705. And that is quite a right principle, is it not?—No; far from it.

10706. Not that the good man gets more than the bad one?—Yes, but he does not.

10707. We misunderstand each other. If the young man is as good as the old man, and shears as many sheep, he would not subject himself, in all probability, to work for a lower wage?—I should say after the young man has got started for a year or two he is better than the older one.

10708. Surely if one earns as much he will get it?—Yes but he will not get any more.

10709. In my own experience he does?—No, that has never been my experience up till now.

10710. With regard to hedging and ditching, do you find among these men that some of these men you teach are quite old hands at it?—No. I am not allowed by the County Agricultural Committee to do so. I am not allowed to teach them. The man must be a novice.

10711. Does he work for the love of work?—Yes, I presume he does.

10712. I should consider you a very valuable man if you could get all these men to come and work for you for the love of their profession?—If I thought they were coming for the love of money I have the privilege of denying them coming on.

10713. Do they continue it afterwards?—Yes.

10714. You are too short of time in Wiltshire to speak of the effect of what you do, are you not?—No, I am not; I could point out different gentlemen to-day who, when I first went, had one chain cut, but who now have a mile.

10715. Are these prizes you refer to given for competition?—No. They have seen the value of having it done, and they have had it done since I was there before.

10716. Supposing you made a tour of seven or eight villages, should you have a competition for a prize for each village?—If they could not provide pupils from one village and could provide them from two or three, then they join together.

10717. But in a competition for prizes, do the villages join together and have a competition at a centre? You do not have a competition in each village, do you?—Yes. And each of these pupils that attend from amongst them is eligible for the prize.

10718. And can earn 25s.?—Yes, that is, if he is the best man.

10719. Do these men ever go to the county shows and

compete in the competitions there?—They are not compelled to.

10720. No, but do they?—That is a thing I could not tell you, because there is never any hedge-cutting there.

10721. Does your teaching come out at the top in the county competition?—I could not say that, but they do very often in local competitions instituted by local gentlemen.

10722. I can quite understand how these men compete under your tuition, but there must be a man at the top, and in all probability always a man at the bottom, and do these men in competing with all the practitioners at the county shows come out at the top?—I could not tell you that, because that work is not done at the county shows.

10723. Not shearing?—Yes, there is shearing, but I have only held two classes in shearing in Wiltshire.

10724. But going back to Lincolnshire, where you were an older hand, has it taken place there?—Yes.

10725. Has your teaching come out on the top there?—Yes.

10726. Does the same apply to ploughing? If your pupils go to ploughing matches are they better instructed, so that they can beat all the other men at the ploughing matches?—I have ploughing pupils that are now instructors in ploughing.

10727. But are they able to hold their own with older men?—Yes, they are.

10728. Then you are only allowed to instruct juniors. You are not allowed to take any elderly men in?—Elderly men occasionally get in, but we prefer to have a class of younger men, and we do not take in professional labour.

10729. Now about money. If this money could be procured by every county council, you would advocate a person of your class being employed by every county council?—I should have someone employed in every county—the very best I could get.

10730. I think Wiltshire and the division of Lindsey in Lincolnshire almost stand alone in employing a person of your class; but if there could be money enough found by every county council, you would recommend someone of your class being employed to teach these manual processes in every county?—Yes.

10731. That is what you meant by saying there was ample room for teachers?—Yes.

10732. Still, you know that is not so?—No.

10733. Do you know any of the counties that have got a teacher of your class?—Yes, there is Somerset, Gloucester, and the other parts of Lincolnshire, and almost every county that you can mention—they have teachers of some description, but not always travelling men.

10734. Are these teachers always agricultural labourers?—Yes.

10735. Always.—Yes, for anything I know, but I could not say, because I have not been in every county. That is a thing outside my jurisdiction.

10736. There is a good deal of feeling about these things, I know, and I daresay you know that is so, if there are people of different classes taking such places?—No, I could not say that.

10737. (*By Mr. Davies.*) Could you tell us very roughly how many students have passed through your hands in Lincolnshire and Wiltshire?—During the five years since 1902?

10738. Yes; give it roughly?—From 3,000 to 4,000, I should think.

10739. That is in hedging and ditching, and so on?—Yes.

10740. Then with regard to hedging, do not you find the farmers think it is much cheaper to put up wire fencing

instead of bothering to have hedges?—Yes, I am afraid they think so.

10741. But you do not think it is cheaper?—I am certain it is not. Of course, I know it is becoming now very popular in many parts to cut the hedge down, and then to fence it by barbed wire. But I always try to make a live thing, and protect it and keep it alive.

10742. Then you think there is a demand for your men?—Yes, there is a demand, and a very large demand, for them.

10743. (*By Lord Barnard.*) One question about thatching. Is not one reason why thatching has become less owing to the fact that there is less arable land and less straw available?—That might be one thing in Wiltshire.

10744. I can tell you, as a matter of fact, it applies in other districts as well as Wiltshire?—I have no had experience in other counties.

10745. Is there anything else you would like to say to the Committee?—No, nothing, only that if I were to give my thought as to what I think would be the very best thing you could do, it would be to try to continue these classes on a very much larger scale than they are. Of course, every gentleman has not the benefit of seeing what I see of them. I always get about the county, and now and then, as I say, I see a great deal of need for a great deal of improvement. Knowing as I do that all of us mankind get our living from the land, I am sorely afraid we are letting the land go more than anything else.

10746. Who actually supervises your work? Take the parts of Lindsey to begin with. Are you under the Education Secretary?—Yes.

10747. And you take your orders from him, and so on?—Yes.

10748. And the same thing in Wiltshire?—Yes.

10749. With regard to the money spent on these classes, there is, of course, your own remuneration. I will not go into that at all, but what are the other expenses of the class?—The other expenses are not large. There is some small remuneration. I think it is about 7s. 6d. which is allowed for the organisation of these classes, but that is about all.

10750. But do the men who come to you get paid for every day while they are working?—No, they get nothing.

10751. They come at their own expense?—Yes, except their masters choose to send them for the benefit they get from it afterwards.

10752. But it pays them even to lose a week's work to come to you, because they get better places afterwards?—Yes.

10753. I will not say better money wages, but places afterwards?—Yes.

10754. (*By Mr. Latham.*) You have just made rather a sweeping remark about the almost neglect of agriculture, or something to that effect. Do you think that is because there is less interest taken in it, or that there is less money to spend amongst the farmers themselves?—That there is less money to spend, is my opinion.

10755. You do not think farmers are quite so ignorant?—No, far from that.

10756. The point is, farmers have not so much money to spend on the little details of farming as they had previously?—No; there are so many more draws from the land than there used to be in years gone by.

10757. (*By Mr. Davies.*) Do the Hunt Committees in Lincolnshire subscribe towards your expenses?—No.

10758. Do you think they ought to?—I must not touch on that question. I know they do in Wiltshire. It is rather an important point that the Wiltshire hunting people give prizes to the extent of £100 for hedges to be cut in the same method as I have been teaching in Wiltshire during the last winter. That is done by the Vale of the White Horse.

Mr. CHARLES SHEATHER, F.R.C.V.S., called and examined.

10759. (*By Lord Barnard.*) Will you tell the Committee exactly what you are yourself?—I am a veterinary surgeon in London, and have been practising over 30 years. I originally served an apprenticeship of five years, two years being in the actual manual work of shoeing horses. Then I went on to the veterinary side of it and became qualified in 1877, and obtained a Fellowship in 1883. I have been Master of the Company of Farriers since 1905.

10760. And you are here as their representative to-day?—Yes.

10761. I believe you wish to give the Committee a very short *résumé* of the history of the examination and registration of the shoeing smiths which your Company have adopted?—In 1889 the Company took a more active part in the trade with which it was originally connected, and a meeting was held at which it was determined to form a committee constituted of some members

Mr. P. Alltoft

25 June, 1907

Mr. C. Sheather.

Mr. C.
Shafter.
25 June, 1907

of the Royal College of Veterinary Surgeons, of the Farriers' Company, and members of the Royal Agricultural Society of England, to frame a scheme whereby the farriers' trade might be benefited. As a result the Committee framed a scheme which was put into practice as far as it was then able to be put in practice. Personally, I may say that I was an opponent of the scheme at the time, and dissociated myself from it, because it did not attempt to deal with the manual portion of the trade.

10762. It was purely theoretical?—Yes. An examination was instituted, and that was conducted solely on the anatomy of the horse's foot, and for two or three years that was carried out, and a large number of men were registered under these conditions. Then it was changed and a manual examination was instituted as well as the examination on the anatomy of the horse's foot. Then I felt I could give assistance to the Company, and recently I have taken an active part in the management of the Farriers' Company.

10763. You say here that, in 1893, a small committee, termed the Registration Committee, consisting of members of the Court of the Company of Farriers, members of the Royal Agricultural Society of England, and of the Royal College of Veterinary Surgeons, and two registered shoeing smiths, was appointed by the Court of the Company and has been elected annually ever since?—Yes.

10764. What is the work of that committee?—It is to institute and conduct examinations. The Company, from want of means, is quite unable to undertake any real teaching. The teaching of farriers is a most expensive thing. It means a travelling instructor or an ambulatory van with men going round with it, and that has to be supported. That is being done by some of the county councils with great success, but the Company of Farriers, owing to shortness of means, has rather limited itself to the bestowal of a certificate of efficiency after an examination by their examiners, and these examiners are now usually a veterinary surgeon and an active smith—a smith, that is, who is a registered man.

10765. In fact your Company has really undertaken more of the duties of an examining and registering body than an instructing body?—Up till now that has been so.

10766. Would you tell us from what source the expenses of the examination and registration are provided?—The expenses come from two sources—small fees charged to the men for examination and registration and donations by friends of the movement, and contributions by the Farriers' Company itself and individual members of the Company.

10767. Do you find that the finances at your disposal have sufficed to enable you to carry on that work?—We are just able now, with a little increase of the means which the Farriers' Company has become possessed of within the last eight months, to carry it along. We have been working at a loss for some seven or eight years, each year showing a diminution in the funds till this year, when there has been some re-arrangements of the affairs of the Company, and we have got a slightly added amount of income, and that income, together with some donations, now is being diverted into the hands of the registration committee for the prosecution and support of this particular work.

10768. But you could not extend your operations in any way—you could not undertake fresh work?—We could not undertake it with any amount of success. We should fritter away money in ineffectual efforts if we were to undertake teaching in our present state. We might institute lectures, but to my mind those lectures are not of downright benefit to the actual workman.

10769. Your Registration Committee publishes a report every year?—Every year. But there are two years, I think, missing—one was 1905, owing to a change of the clerk of the Company, when affairs wanted a little clearing up. That has been done, and we have issued a report this year: 1903 failed and 1905 failed in the reports; but all these others I have, and I have brought the reports with me.

10770. Perhaps you would hand them in to the Secretary of the Committee?—Yes, I brought them in case of reference, as I could not carry in my mind all the details.

10771. What do you do with these reports? Do you circulate them amongst the veterinary profession, or how?—No, they are circulated in the Farriers' Company and amongst the committee of registration, and anyone who is at all interested can have one. We do not send them away broadcast, because we might waste a lot of money in

sending them to people who are not interested, but they are always open to any one who is interested.

10772. Does the balance-sheet go into these reports?—Every year there is a balance-sheet, and I have here all particulars in full detail as to the sources of the money and how it is expended.

10773. Are these balance-sheets audited?—They are audited by Turquand & Young, except for the last two years. As 1906 was not a very good year we did not hold any examinations that year, because of the change of clerk and shortness of funds. But some examinations were held in connection with agricultural societies' shows.

10774. How far are you in touch with, or how far do you bring your work to the notice of, on the one hand, the College of Veterinary Surgeons, and, on the other hand, the various county councils and agricultural committees?—That is done by circular.

10775. Do they all know what you are doing?—Yes, that has been done every year, and is done at the beginning of the year. There is a circular, of which I have a copy, which is issued. We issued it this year on January the 28th, calling attention to the existence of our examinations. There is a copy of one. (*Handing same.*) There is a deal of difficulty in holding these examinations. It means the collection of horses to shoe, the provision of a forge and material, the arrival at the spot of the examiners, and the arrival of the candidates; you can see that is a very difficult thing to arrange. Even locally it is found difficult to arrange, and it is also much more difficult for it to be arranged from London. But we depend a good deal on the goodwill of people in the locality, who are willing to take a little trouble to make an arrangement. At Birmingham recently there was an examination, and there we have a friend, Mr. Malcolm, a local veterinary surgeon, who takes an interest in the thing, and he lets us use a corporation forge on Saturday afternoon for the examination.

10776. I notice that you do not confine yourself exclusively to practical work, but go as far as recommending the study of certain books.—Yes. Some of these works are very practical. It is a very wise thing to give a certain amount of that kind of study, to be added to the actual practice, as contributing to dexterity in shoeing a horse. It conduces to the horse's benefit if it is done in the best way. No amount of lecturing or reading will make a man a workman. He must know his business and be dexterous in the management of horses and their feet to know how to shoe.

10777. You have had great experience yourself, and do you think that the art of horse-shoeing has improved of late years?—Taking the whole thing, it has improved. The numbers of fair workmen have increased. But I think in the last 30 years we miss the very fine workmen that existed 25 or 30 years ago. There used to be a man who stood tremendously above his fellows. There has been a general levelling; but on the whole the level is now higher than it was 25 or 30 years ago.

10778. Do you think that if it had not been for the efforts made by your Company and others interested in the subject the art of horse-shoeing would have been more declining?—I think certainly it would have declined if the interest in it had not been stimulated. If we have done nothing actually in the way of improvement of individuals, we have done a good deal by drawing attention to the trade, and stimulating the workmen themselves to acquire a better knowledge and greater handiness in their craft.

10779. You think that there would be probably more highly skilled or very exceptionally skilled men?—Yes.

10780. But without your assistance and that of others engaged in similar work, the trade and the level of the average man would have gone down?—I think it would have deteriorated.

10781. In other words, you think you are doing a good work which ought to be maintained?—I think that is undoubtedly so.

10782. And perhaps enlarged?—And enlarged.

10783. To do that more funds would be necessary?—More funds are necessary, and a rather different kind of scheme. You may notice at the end of that document we are now instituting a scheme whereby we shall make another grade of men, that is, men who will be fine workmen, so to speak. They will go through a more difficult examination than that instituted at the present time, in

order that they may become qualified afterwards as instructors or as examiners. The great desire now, I think, is that one of the examiners should be the actual practical workman, and one who, therefore, is in a better position to judge of good or bad work than a theoretical man only.

10784. But at the same time there is an opening, I should imagine, for an increase of scientific knowledge in this as in any other subject?—Yes, but the opening is a very difficult thing as to determining where the line shall be drawn. It is one thing to fit a shoe to a horse's foot as a horse's foot, and another thing to be skilled enough to watch the movements of the animal and determine the action of all its limbs and so arrive at the best method to shoe it. If you attempt to educate a farrier up to that you would give him an education that would take a long time to get. At the present moment the farrier works by rule of thumb. A horse is brought to the man, and the man sees it has bruised itself with one foot brushing against the other leg in a particular place, but that farrier will not be very competent to deal with that case properly. He is not competent to say: "Take that horse outside and let me see how he moves," nor to form a proper judgment of his movements. He is not able to do that, and, as a rule, he scarcely would be taught it successfully. A few men might. Therefore he has to be taught in a sort of rule of thumb way. If a horse cuts himself under the knee with one foreshoe we who know and can watch all the horse's action can say, "If you shorten the inside of that opposing shoe you will find he will miss the knee." But, briefly, the farrier learns by rule of thumb that a horse doing a certain damage can be altered in a certain way, and that is the only way in which they can be taught at the present time. I do not think a farrier will ever be intelligent enough to work out for himself from a horse's action the varying necessities of horse-shoeing. That is where the scientific knowledge must always come in in the matter of horse shoeing, and trained powers of observation.

10785. You know, of course, I daresay, as we do, that a great deal is being done by all the county councils, or most of them?—Yes, that is so, and a majority have applied to us to nominate examiners.

10786. Some of them help you, I think; and do you think we ought to suggest that every county council should help?—I think so.

10787. In the interests of agriculture?—Yes.

10788. That every county council ought to undertake instruction in farriery?—Yes. Part of the value of the agriculture in the country is its horse stock, and bad shoeing of the stock lays the foundation of diminished value in after years. A young horse, if badly shod when two or three years old, at five years may be terribly depreciated in value owing to that.

10789. (*By Lord Moreton.*) I should like to ask you one or two questions as regards funds. I think I am right in saying that the funds at the disposal of the Farriers' Company are, briefly speaking, limited?—Yes, exceedingly small.

10790. I think I may also say that you wish to point out to this Committee that all those funds are really devoted to the objects of the Farriers' Company?—Yes, that is so—it has been quite so.

10791. And there is practically no moneyspent on strictly outside objects?—No, nothing. There is a little spent on that which is contributed by members of the Court in their fines.

10792. (*By Mr. Acland.*) Have you any general comment to make on the practice of county councils in encouraging farriery? Have you any comment to make on any general defects that you notice in a good many counties?—I cannot say that I have. I travel about a good deal, and in those counties where the instruction has been given by a travelling van, there is a better knowledge of shoeing, and a better handling of the thing than in those counties where no such efforts are made.

10793. Do you think on the whole where the work has been taken up it has been done in the right way?—Yes, I think so.

10794. You cannot give any general criticism or suggestion as to that, can you?—No, I do not think I can. The only fault one sees with these things is that a workman has already started work and got into methods which probably are not the best, and then comes along an instructor, who tries to divert the man from his old groove and make him adopt new methods. The fault of all instruction of this kind is that the workman has some knowledge that is probably got in a haphazard sort of way, and then he is

asked to put that into shape by instructors afterwards. It would be so much better if the instruction could come from the beginning, and that those belonging to the trade should have a grounding in the simple anatomy of the hoof, and the simple principles governing shoeing, before they commence to practice it as a trade.

10795. Do you think that must be done by coming into the locality, so to speak, by means of travelling vans, for instance, or taking the class to the man?—There are not enough farriers wanted in one locality to warrant the institution of a permanent school. A great central permanent school might be established, and pupils could go there, but that means expense, which I can offer no estimate of.

10796. But in any big county, say Devonshire or Somersetshire, what would you suggest is the best way to get hold of young men who are going to be smiths?—I cannot say, because one does not know from what source the young men come. Usually they are from farriers' families. Farrier succeeds farrier, and they begin to work in the forge straight away. Apprenticeship is almost a dead letter now. That is the best way to produce good workmen, but that has dropped out, and the next best thing would be to form classes in forges under a travelling instructor. That is the next best thing I can see at present.

10797. That is what you would advise if any county council came to you and said: We have got so much money to spend on farriery?—Yes, I think all classes are benefited by these instructions, but the best result is not obtained except by taking the farrier before he commences his work and teaching him something first.

10798. You think more can be done by ambulatory classes than by offering scholarships, for instance, to young men to become farriers, who would come to a centre?—If that could be done, and a centre could be maintained, the cost of which I do not know, I should certainly prefer the centre. I do not think a travelling forge can maintain itself in one district long enough to give the period of instruction necessary, but a single travelling instructor might. There may be a horse coming to the forge one day with a good foot, and the very next day after the travelling forge is gone there may be a horse with a very bad foot, when instruction is most wanted, and there is not the instruction at hand that is required. A central place would be far more efficient, where a pupil could go for a couple of months. But then the difficulty of that would be the provision of horses, because with instruction in farriery there is the necessity of having horses, and that is the great difficulty—to find the animals on which the man can practice, or on which he can see the trade carried out. Apprenticeship in this trade is the only thing, and that should be only permitted to men of known capacity and known skill in their trade. If the inferior man takes an apprentice, the apprentice becomes an inferior man. Our examinations have done good by stimulating men to become registered, and the better men have done so in large measure, and if only we had means we certainly should assist apprenticeship to good men, because it is a trade that you cannot teach in five minutes, there are so many variations in it, and although the ambulatory forge or the travelling instructor is as good as anything done yet, and is an improvement on doing nothing, still it is not equal to a school where a young man could go for a couple of months, say.

10799. You think in default of a school, money might usefully be spent by county councils on helping the apprenticing of men to good smiths?—Yes, that would be even better than ambulatory schools.

10800. (*By Professor Middleton.*) When do your young smiths begin their work?—Usually about 17.

10801. Not before 17?—No, not before.

10802. You say the apprenticeship system has almost died out, I understand?—One hears of but very few apprentices.

10803. A young smith is not put on to mend the horse-shoe just to begin with, is he?—His duties are first manual—usually carrying coals and stubbing old shoes. He gets to handling tools, and blowing of the bellows and heating the fire, and then giving a blow to the fireman.

10804. As a matter of fact does he begin to touch the shoe in a year?—No, it is longer than that. It is three years, probably, before they go to forging shoes, and often not then.

10805. So that the young men you want to instruct would be about 20 to 22?—Yes, about that. Our examinations show men at 20 sometimes to be very competent, and far superior to the old men. I have seen it at Birmingham.

Mr. C.
Sheather.
25 June, 1907

Mr. C.
Sheather.
25 June, 1907

I saw a young fellow of 19 examined who was the best mechanic in the place that day. Some men have a special aptitude for it, and can do it very quickly.

10806. Your suggestion is that we should have, failing a system of apprenticeship, an instructor going round?—Yes, I think that is the best plan, though it is taking a steam hammer to crack a nut, considering the few who require the instruction, or who benefit by it. The older men will not benefit by it.

10807. I should have thought even the older men if they saw a good smith coming would endeavour to learn something from him?—Yes, but there is always jealousy, and a man a few years older than the instructor does not feel that he can get instruction from him, and is not willing to admit it.

10808. (By Mr. Latham.) You gave us the year 1890 as the year that this interest in horse-shoeing started?—Yes, by the Farriers' Company. They were the originators of it, I think. They really drew attention to it.

10809. Are you quite sure you were the originators? Did not some of the county councils start prior to that?—I do not know that; I have no knowledge of it.

10810. Was not it the very fact that some of the county councils were starting this that drove you up a bit?—I do not think so. By referring to the reports I could find when the county councils took it up.

10811. I daresay you knew Mr. Albert Wheatley very well?—Yes.

10812. He and I started before 1890 with a travelling van, going round the county of Berkshire, and many counties in England besides?—Yes?

10813. That was the impetus, I think, to the Farriers' Society. We did not start from you, but you from us?—I do not wish to arrogate to ourselves the position of being the originators in every way, but I think we were.

10814. (By Lord Barnard.) The first resolution of the Company of Farriers I see is dated 1889?—Yes.

10815. The Act was passed in 1888?—I think I have the dates here about the Berkshire County Council, and I think I can read you something about that. This says: "The Berkshire County Council, which was the first to organise lectures on horse-shoeing"—

10816. (By Mr. Latham.) And the travelling van?—Yes, "This year the Council proposed to dispense with lectures, and they have under the superintendence of Mr. Wheatley organised a migratory school." As this is from the Registration Committee's Report for 1893, therefore, that brings the date correct, namely, 1893.

10817. Now with regard to the travelling school with the vans, it is, I suppose, we may take it, the only alternative?—It is the only alternative at present.

10818. Can you see any way of possibly starting a school in farriery?—No, I do not see it unless the school is a large one for the whole country. Locally there are so very few men in a district requiring instruction that you cannot establish a school. It would be only lasting six months, and then put aside till another man came along. It is not as if everybody wanted instruction in horse-shoeing.

10819. You know that the van started in Norfolk, and has been running ever since?—Yes.

10820. I suppose I may take it from you the van has done extraordinarily good work?—Yes, and we say so.

10821. You yourselves feel as a Farriers' Society, that you can never be a teaching body?—We do not see how it can be done. We have not the means, to begin with. But we do not see how it can be easily done. We can give instruction in a way, but that instruction must be, naturally, desultory, and must be by means of lectures, and I for one do not consider that lectures are very beneficial to the trade generally.

10822. But still I suppose you will agree that lectures by such men as Mr. Wheatley and Professor Pritchard, and that class of men, could be very beneficial to the farrier?—They could be beneficial. I do not say very beneficial. My experience is they are not. They cannot do harm, and they must do good.

10823. But speaking from experience, is it not rather a wonder that there are any shoeing smiths at all?—I do not think so.

10824. Nature has in a sort of way taught them up to now. The old smith never had any education, had he?—No. He did what his father and grandfather did before him.

10825. And a great many of them really did not know they could do wrong by driving the nail into a soft place in the foot?—They found that out, and they found it out very early in their lives.

10826. They found it out by punishing the horse?—They knew that the nail pitched in a certain direction did damage, and pitched in another direction did not do damage, and probably they learnt that from their fathers, and their fathers probably got that discovery from their great great grandfathers.

10827. Except by diagrams and sheets they were perfectly ignorant of the inside of the horse's foot?—The majority were.

10828. We have found a very great disinclination on the part of the older men to be taught, but on the son getting to be a better man than the father, they very soon found it necessary for them to be taught. Have you not found that is so?—I quite believe that.

10829. Now with regard to your examination, you said I think, that you charged fees for all examinations?—Yes.

10830. But that is not quite so, is it?—In some cases it is, and in some cases it is not.

10831. But you allow us at all our agricultural shows to examine free?—You examine free, and our examiner examines on our behalf for the granting of a certificate. Sometimes he receives pay, and sometimes the pay is given by the Society.

10832. But these men, the smiths, never can pay anything?—In some cases they do not.

10833. Then it would be wrong for it to be put in our report that a registered smith could only be registered on his paying fees?—It would be quite wrong to say he could be registered without.

10834. For instance, last week we had an enormous number of men at Newport, and every man that gave his name in was examined and registered, but he did not pay any fee?—I do not know how that is arranged, and whether the Society pays the fee for the men.

10835. Do you mean the Agricultural Society, or your Society?—The Agricultural Society. I do not know whether our Company under certain conditions, considering the expense of the examination is borne by the Show, do not supply the examiners. Probably we may in some cases. Not all these are hard and fast principles. Some vary from others. I think it is an advantage that the whole expense of the examination is borne by the Society giving the Show. In some cases our examiners are sent free at our expense to examine, and the men do not pay in those cases an examination fee, but only a registration fee.

10836. Do you consider that these men that are registered at the Show are practically or entirely on the same basis with the man who pays his fees, and is examined by you?—Yes, I think so, as he goes through the same examination as he does at other places.

10837. How do you set any examination?—We send examiners down.

10838. But do you set any examinations? This is rather a sore point with me, and I take great interest in the examinations, but we never seem to have any schedule to go through your curriculum?—I think it is in the circular that I have handed in that the examination shall be a theoretical and manual one. It gives details. The man shall prepare a fore foot, and make and put on a shoe, and do the same with the hind foot, and answer questions on the anatomy of the horse's foot. That is distinctly stated in the circular sent round.

10839. Do you expect these examinations to be made on the horse's feet that are produced?—No, the theoretical examination is made from models, of which Mr. Wheatley has a number produced. The theoretical examination is made upon that, and the practical examination is made by inspecting—the man going through the whole of the work which he has to do.

10840. But all your veterinary surgeons are not Mr. Wheatley, and when a man is disposed to hold an examination of your class has he any models to produce to that class?—No, not of necessity. As a rule they do. Mr. Wragg does.

10841. Are you satisfied with him examining without producing these models?—I do not know that they do not produce the models.

10842. But if you are going to lay as much stress on registration as I think should be done we should have some definite line sent to us at every show that that must

be the line these men must be examined on?—I think that is very clearly laid down there. I think it is easy to find what the men are expected to do.

10843. Now with regard to shoeing a bad foot, we have a class there that does what we call turning shoes from models supplied by the judge. Do you hold that is good teaching?—Yes, I think that a man should be able to work to a model. That is part of what I said before. That is the only way to teach a smith—that is, to show him models for such purposes, and ask him to copy them. By that means he can make them.

10844. That is scientific teaching, I suppose?—Yes, that is scientific teaching.

10845. And of great value?—Yes.

10846. Do you keep a register of these shoeing smiths? Yes. There is a copy of it. (*Handing same.*)

10847. You allow a doorman to be registered, as such, as young as 21 years?—Yes.

10848. What do you consider the capacity of the doorman is? What must he be able to do?—To strike to the fireman, to file up a shoe, and put it on by driving the nails and clenching them off.

10849. Has he to pass the same examination on the horse's foot as the other man?—He has to pass an examination in just the elementary anatomy of the foot. He wants no more for his trade.

10850. He really has to pass as strong an examination as the master man?—He has to pass the examination that is mentioned in that circular on the anatomy of the horse's foot.

10851. Just the same as the other?—There is very little difference.

10852. But there is a difference?—There is a difference in the matter of clip clips, forging and fitting out, and that sort of thing.

10853. I think you send out to almost all agricultural societies that you allow these examinations to be held?—Yes.

10854. But you do not make it a *sine qua non* that the examiner must come from your own body?—That I am not sure about, but in the majority of cases they are selected, and we have a list here from which the examiners are selected, if you would like to see it.

10855. I have seen that?—I do not know that you have seen them very lately.

10856. I have seen it for this year, and I want to ask the question: do you allow registered smiths to examine?—Yes; only if they are on our list.

10857. Do you think, as a veterinary surgeon, that they know enough of the horse's foot to hold these examinations?—Certainly they do not. The examination we give our certificate for is held jointly by a veterinary surgeon and shoeing smith.

10858. You are quite prepared to accept the veterinary surgeon alone, but not the registered smith?—No, not the registered smith alone. We should accept the veterinary surgeon who is well acquainted with horse-shoeing alone.

10859. But it is suggested that the registered shoeing smith should not examine. I think there are very few registered shoeing smiths that are competent to examine?—That is so, and with that view we have only on our list Thirle and Mills, who are well known to us to be exceedingly good men. The last scheme brought forward as the remedy for that is to get the men to pass the superior examination, and from them should be drawn the examiners. I do not know whether you have noticed that. The two might continue to work together in examining, but we are short of registered shoeing smiths who could be trusted with the examination. We are, therefore, now initiating a scheme to bring forward a higher grade of men, and men who after having become R.S.S. shall go through another examination. I have a syllabus here which I should like you to take and read at your convenience. That only gained the assent of the Court of the Farriers' Company yesterday, so that you have an advance copy of it. It is not quite in these words, but the scheme has been approved in that spirit. (*Handing syllabus to Mr. Latham.*)

10860. Is there any feeling that this registered shoeing smith's certificate is too easily gained?—I do not think so. I have not experienced that feeling yet. I think in the early time it was so, when a number of men were admitted on testimonials only, and a number of men, from 19 to 23 say, were admitted on an examination of the anatomy of the foot of a horse only. I know a man who never had

put a shoe on a horse in his life who went under the examination and that is when I objected to the scheme. But since the manual examination has been instituted as well as the theoretical, I do not think it has been objected to.

10861. You are willing to admit there has been a very great advance in horse-shoeing since 1889?—I think horse-shoeing has improved very considerably.

10862. The old-fashioned way of making the foot give to the shoe has almost died out?—Yes, the foot is studied individually by the man.

10863. And now when a horse gets on in age there is a very visible improvement in the formation of the horse's foot?—Yes, horses' feet have grown stronger and better than they were.

10864. There is very little money now spent by the county councils on that subject. There has been more done to improve the system in agriculture than in other ways?—I do not know about that. I know that money spent in farriery is very well spent.

10865. It has been an absolute wonder how the shoeing smith existed—"he grew," as a very old friend of yours said?—Yes, he grew. He profited by what his father did before him. He had a rule of thumb, and he did as his father did before him.

10866. It is not very surprising that shoeing smiths got rather low in numbers?—No, not at all. It is a very laborious trade. One difficulty in obtaining them is that the man who is intelligent enough to benefit by instruction in doing this work, is, as a rule, intelligent enough to take up some less laborious occupation.

10867. But the business of shoeing smiths has increased wonderfully. There are a great many more shoeing smiths than there were some years ago?—I do not see how that could be, though horses have increased in numbers. I know farriers' shops that have been shut up in London.

10868. That is perhaps from motor cars coming in, but in the country we have more shoeing smiths?—Yes?

10869. (*By Mr. Medd.*) Is your Company in the habit of sending annually suggestions to the various local authorities as to the desirability of instruction in farriery, and the best methods of imparting it, and the duration of the course, and the results which accrue from instruction?—No, we have not done that.

10870. Do you not think it would be an effective way of increasing your work to do so?—I daresay it would be so, but as the farriers' trade is governed in the various districts by local conditions it is impossible for us to dictate, say to Northumberland or Cornwall, how instruction should be given. Local conditions vary to that degree that we, as a central body, could not dictate any advantageous plan for them to pursue.

10871. What I would say rather, then, is the advisability of impressing every local authority with the desirability of instruction in farriery?—Yes, that would be all right.

10872. You would bring before them the successful results which have within your knowledge accrued in all localities?—Yes, I think that has been done by the issuing of our circulars every year to public bodies as well as to farriers, I think that the advantage of our examination is put forward in that way.

10873. But as part of the examination you want a class?—The difficulty of the whole thing is that we, as a body, who have given this examination, cannot dictate at all how the knowledge shall be obtained; we allow people to obtain the knowledge as best they can.

10874. But my point is, as to pressing upon local authorities the desirability of imparting such instruction. The exact kind of knowledge which should be imparted may be left?—That must always be left to be governed by the local conditions.

10875. Then would your Company be prepared to circularise each local authority annually as to the desirability of forming classes in farriery?—Yes, I think they would be very willing to do that.

10876. I hope you will bring it before them?—In fact I am not quite sure that it is not done now. I believe that public bodies receive notice from us, and have done for a long time past, because they are in constant touch with the secretary as to the examinations, and as to the appointments of the examiners.

10877. I mention that because I notice that in so many counties no instruction in farriery whatever is given?—No.

Mr. C.
Sheather.
25 June, 1907

Mr. C.
Sheather.
25 June, 1907

10878. There is none in Berkshire, is there?—In Berkshire I believe there is.

10879. Then why is it omitted from the Government report?—That is one of the points made a little while back as to the difficulty of establishing a school—that you have not enough farriers to keep the school in existence unless it be a large central school.

10880. The public, and those who read these reports, are not in possession of these facts, and my point is simply as to the desirability of impressing the importance of such classes annually upon every local authority?—Yes.

10881. And I hope you will kindly consider it at some one of your meetings?—Yes.

10882. You are aware of the good work that is done in Monmouthshire and Gloucestershire?—Yes.

10883. If every county adopted the system of Monmouthshire and Gloucestershire in organising classes, no doubt considerable improvement in farriery would be the result all over the country?—Yes, that is so.

10884. (By Lord Barnard.) I suppose you will agree with me that in the case of farriers as in the case of everybody else concerned in rural businesses, you cannot hope to succeed the first time, and you try to convince people engaged and to persuade them of the necessity of instructing them at all?—Yes, one meets with most lethargic bodies.

10885. Perhaps your experience is the same as mine. When the Royal show was held at Darlington I tried to persuade my own smiths to go and pick up some wrinkles at the lectures given at the show there, but they came back and practically informed me that they knew as much as the teacher?—Exactly.

10886. That is the sort of feeling?—That is the feeling.

10887. Then, if your Company were to undertake the

duty of being the apostle of this kind of work, it would mean an increase of expenditure?—We are already expending all our funds practically, and we have not enough. We do not do it to my satisfaction, at any rate. We are limited in means, and we find the very greatest difficulties in the way usually. In regard to that, personally, I say it is not from want of energy or desire, it is from want of means.

10888. Do you think the Board of Agriculture might take up the case and urge the necessity upon local bodies?—I think it would come better from someone in authority than from a voluntary company. We do what we can to bring to the notice of people our efforts to improve the trade; but we cannot compel people to do it, but only urge upon them the advisability of doing it.

10889. The ratepayers of the county should urge upon their own representatives the desirability of it if they want it done. Would you agree with that?—Yes.

10890. Public opinion should do it?—Yes, public opinion should be brought to bear upon these subjects.

10891. It is hardly the duty of the Farriers' Company to tell the county councils how they ought to do it, but it is the duty of the people of the county?—Yes, that is so. The whole of our work is voluntary. What work we have done we make no profit out of. We are working at a loss every year, and I think we ought not to be subject to any criticism on that matter or be forced to take up work of the kind. We do the utmost we can, and do it to the best of our ability, and we are willing to do a great deal more if we have the means of doing it.

10892. (By Mr. Latham.) I have not seen this paper before, and may I ask what is about the proportion of men that pass in comparison with those that come up for examination?—I could not give you that now.

Mr. GEORGE LANGRIDGE, called and examined.

Mr. G.
Langridge.

10893. (By Lord Barnard.) You are, I believe, the President of the Surveyors' Institution?—I was until the 1st June last.

10894. You know, I daresay, the terms of reference to this Committee?—Yes.

10895. Might I ask you whether you are going to speak here exclusively on your own behalf, or whether you represent the views of your Institution?—I speak on my own behalf; but I think I may say I know pretty well the views of many of my fellow members to be the same.

10896. Is the subject of agricultural instruction one that often comes under the view of the Institution?—Yes, we have established scholarships at Cambridge and Newcastle and Bangor for agricultural subjects, where there are degrees given.

10897. Do you attach any conditions to these scholarships as to what the young man has to do after he has passed through his examination?—He is expected to follow up the business of a surveyor. That is intended. When he goes in for a scholarship it is expected he has made up his mind to follow the profession of a surveyor or land agent.

10898. Is that the arrangement that has been arrived at by the Committee of your Council?—Yes, and I was one of the Committee.

10899. I assume the members of that Committee satisfied themselves of the value of the work done in these University colleges?—Yes.

10900. You thought it would be an advantage to provide young men in your profession with all the benefit they could get from the courses of instruction in these colleges?—Yes, that was the object. Those who can give the time to study these interesting subjects do it and take a degree in agriculture.

10901. Is it your opinion, and is it the opinion practically of members of your profession generally, that it is desirable if possible that surveyors and land agents should have some scientific training?—It is. That is quite their opinion. In fact, it is really necessary to have some considerable scientific knowledge to pass our own examination.

10902. You have an examination already of your own, have you?—Yes, we have three examinations leading up

to the Fellowship of the Institution. You have to pass the preliminary, the intermediate, and the final.

10903. You do no teaching?—We do no teaching—only examining. But we accept the certificates of certain examining bodies in lieu of our preliminary examination, which is merely scholastic.

10904. Do you consider your examination stiff?—They say it is. It is only perhaps 70 or 75 per cent. who pass. It naturally grows stiffer every year.

10905. That is the only qualification—you do not require any practical acquaintance with agricultural pursuits, do you?—Yes, as far as agriculture is concerned a man has to answer the questions put, and must have some practical knowledge. Being surveyors, they are required to have practical knowledge. The examination covers practical work, but not manual work.

10906. But a sufficient acquaintance with customs as to the rotation of crops and the nature of various artificial manures, and so on?—Yes, and soils and chemistry, and different sorts of stock, and all things generally affecting agricultural matters in the country.

10907. So that a man when he starts in business may not be looked down upon as ignorant of his own profession when he comes to actual close dealing with a farmer?—If he passes his examination fairly he ought to have a good general knowledge. Our examinations are in three classes—the land agent class, which practically covers all these subjects; the valuation class, which covers valuations as well as some of these subjects; and there is the building class. They come under these three heads. They are not transferred from one head to another.

10908. You consider, no doubt, that a knowledge of the nature of farm buildings and building materials and of the best methods of construction of farm buildings, and so on, is essential?—That comes into our land agent class.

10909. It is a matter of very great importance that a land agent and those concerned in the management of land should have a fair amount of skill in the planning of farm buildings?—Yes, that is so. It is one of our most important subjects. They have to sketch and plan and give their own ideas of what a farm building should be.

10910. Do you include land drainage?—Yes, drainage is one of the subjects—or it was lately—we are not doing

that so much now. There is very little draining being carried out at present.

10911. Some of the old draining has got out of date, I suppose?—Yes, and we are beginning to doubt whether the expenditure on some of it was not wasted.

10912. I suppose a student must have a certain knowledge of geology?—Yes, geology and a knowledge of soils.

10913. Is meteorology included?—No, not meteorology. We give lectures on geology, and we have a fine collection. Professor Woodward read us a paper on this subject this last session.

10914. I think your Institution takes a great interest in forestry?—Yes, that is one of the things we take a particular interest in. We have special examinations in forestry.

10915. I think you do know what has already been done by Government aid at Bangor and Newcastle, do not you?—Yes, I know what is done at the Armstrong College and at Bangor.

10916. Do you think that more could be done in that way?—I have been to Cirencester and Aspatria, and inspected their work. Then there is Uckfield College. They all are doing really good and excellent work, and they are teaching well; and the men from these institutions, with their education should make good land surveyors, and good farmers where they have the means. I do not think they are teaching to the extent they might be the agricultural population. They do it in a small degree. There are courses, but what is a fortnight's course to teach a teacher? In fact, it is a case of a little knowledge being a dangerous thing. At Uckfield, I understand, they have a 12 weeks' course, and at Wye 14 days.

10917. We should like to have your evidence as to the opinion of yourself and your professional colleagues as to the work of these colleges from the information you obtain in the course of your profession?—We feel they are doing good work and that is the reason why, on our Committee, we have availed ourselves of our funds to enable the coming generation of surveyors to gain a higher class of agricultural knowledge.

10918. (*By Mr. Medd.*) May I put this question now instead of later: Wherein does the instruction in forestry at the Armstrong College show superiority to similar instruction at Cirencester?—I do not think I have drawn this comparison. In fact, I do not know enough of the Armstrong College to say; but I think from information given me at the Armstrong College it is quite as good.

10919. I understood you to say it was doing excellent work; but you must remember that our Chairman to-day is the representative of Armstrong College, which is a very very highly Government-subsidised one?—Yes.

10920. And Cirencester has not a halfpenny?—No, I am told so. I have been to Cirencester.

10921. You cannot claim any superiority at Armstrong College over Cirencester?—I hope you did not think I even hinted at it, because I did not think of comparing the two colleges. I know more of Cirencester than of Armstrong. I believe Cirencester is doing excellent work, and I much regret it is not receiving Government assistance. No college is worked on better lines. I do not wish to draw any comparison with Armstrong College.

10922. (*By Lord Barnard.*) To continue the subject I began with; you know, of course, that Government assistance is given to a great many institutions for higher agricultural instruction being provided?—Yes, I know that; but it is small compared with other countries.

10923. Do you think that the Government gives sufficient?—No, I do not—not to make it so generally known as it should be. I think the schools might be more highly subsidised; and the principle of subsidising might go even to the lower grade schools, and it would be a great advantage to the agriculturists.

10924. Do you come into contact with cultivating farmers?—Yes, I was born a farmer and followed it for many years.

10925. You know the opinions of other farmers on the point?—Yes, I know one thing, and that is that the farm labour we get now is not on the whole so good as it used to be. The men of course are looking out for other work. For instance, I may say I advertised for a clerk the other day and had 100 applicants, and I also wished to get a man acquainted with fruit and a good bailiff, and I found it very difficult to get one, with the wages about the same.

10926. Have you any idea as to how further public

money could be spent with the greatest advantage?—I think you might make it compulsory for masters and mistresses of the parish schools to attend a course at these colleges.

10927. Do you mean to train the elementary teachers?—Yes, to train the elementary teachers—to properly train them.

10928. That is really outside of the scope of the reference to this Committee, but other witnesses have touched upon it; and is it your idea that, if teachers of elementary schools had more agricultural training, perhaps the result would be that in rural schools the children would be more inclined to stop in the country?—I think so. I think that would interest them in their work. Instead of that they are now going away from what rural training they used to have—the information they used to get in their school days is not available now. Their interest has not been stirred to any extent in agricultural questions.

10929. Is that a subject which is largely discussed in your profession?—Yes, largely discussed.

10930. And you think you are stating the opinion of your fellows?—Of my own profession, especially as land agents and valuers.

10931. You live in the country, do you not?—Yes.

10932. In an agricultural district?—Yes; I live in Kent.

10933. And you also think that practical knowledge of farm work would be an advantage?—I think it is most necessary. If they do not commence that at about ten to fifteen I do not think they care for manual farm work.

10934. You told us very briefly the names of some institutions?—Yes.

10935. Two of them you named were private institutions and the others public institutions?—Aspatria and Cirencester are private, and there is Uckfield, a county college.

10936. You are aware that there are others too?—Yes there are in Hampshire and other counties, and I think they are doing good work.

10937. Have you any suggestions to make for their improvement?—I know more of Wye and Uckfield than of the others; but, as far as I can judge of it, I think that they are doing good work, except as I said before that possibly their training is for men who do not require it so much as the labouring classes. As far as I can gather, the class of men we have there can afford to pay. But the colleges are doing excellent work; though I do not know that they are sending out many teachers. The colleges want to qualify other people to teach.

10938. But are not they doing that?—If I had a son bent on farming I should send him to Cirencester or to such a college. If I had a son who wanted to be a land agent I should send him there also. If I had a son who wanted to go abroad I should send him there for information.

10939. Do you know anything of the Government system of leaflets distributed by the Board of Agriculture?—Yes.

10940. Do you think that is good?—Yes; it calls attention to what is required.

10941. Do you know that most of these colleges issue reports of the results of their scientific work?—Yes, I think that Aspatria and Cirencester and Wye College and also Uckfield do, and it is very useful information that they get and they do their work well.

10942. If that collection and dissemination of useful information were still more organized do you think it would be good?—Yes, and it should be properly disseminated.

10943. And probably the Board of Agriculture would be the body to organise?—Yes. I live in a county where there is a system of hop growing, and I should be very glad to get rid of anything which is detrimental to the interest of that industry.

10944. (*By Mr. Latham.*) You made the remark that the class of labour was not so good as it used to be? That is my opinion.

10945. Has not education a little to do with that?—I think so. Formerly they certainly had more time to learn and more interest in their work. You hardly ever saw a man without an understudy of a boy with him, but now it is difficult to get a boy to help the thatcher or to help with a horse.

Mr. G.
Langridge.
25 June, 1907

Mr. G.
Langridge.
25 June, 1907

10946. That is possibly because of their not coming on the land soon enough?—That is my view. If you let them get past 10 or 15 they are drawn to the towns and they have lost interest in the country, and the parents do not care to encourage them much to stay in it.

10947. Ten to 15 is a good big margin; we can get our boys now at 13?—From the sixth standard?

10948. Yes, if they have passed the standards or make their attendances; but then there are so many ways of taking up the boys. Look at the number of telegraph boys that are wanted and the different kinds of occupations there are?—Yes.

10949. One thing above all others is that agriculture is not very well off as a rule?—No, that is one of the main drawbacks. They have not been able to compete with the wages of the towns.

10950. Now with regard to these scientific places that you see marked with red spots on the map, do you think it is a very great advantage to a farmer to be very highly educated in regard to scientific knowledge?—I do not think he can possibly lose by the knowledge, but, I will say, he very frequently misapplies it.

10951. Do you not think that, to use the words that have been used, if they have three-fourths practical and one-fourth scientific knowledge it is quite enough?—I would sooner have three-fourths practical and one-fourth science than the other way about.

10952. But at the same time you agree some science is better?—Yes, undoubtedly it is better to have it.

10953. And the only safeguard that the farmer has to make is to see that he does not get too scientific if he wishes to follow agriculture?—Yes.

10954. Now you are mentioning very favourably these colleges and saying that if you wanted to have a very highly educated surveyor or land agent you would send him to these colleges?—Yes, I should do so.

10955. The things are totally different?—Naturally. The more intimately a surveyor knows his work the better it is for him undoubtedly.

10956. But still my remark applies again, that the surveyor should be quite three-fourths practical?—Yes; we make that a necessity. We should not consider an examination as sufficient to make a surveyor. We do not give the Fellowship of the Institution till candidates have had five years' practical work.

10957. (*By Professor Middleton.*) You conduct three examinations I think altogether?—Yes, we have three grades.

10958. Three grades?—Three grades and three examinations.

10959. How long have those examinations been going on?—Getting on for 39 years it must be now. Now to become a member it is absolutely necessary to pass an examination; and 10 or 12 years ago membership was by election as well as examination.

10960. You are now a loose corporation; you can only become a member by examination?—They have to go through the eye of the needle otherwise I would not say very eminent men may not be elected members, but examination is practically the only way.

10961. Then you may have how many candidates for these examinations?—Three were 500 for the professional examination this year. Besides, three were 150 for the students' or preliminary examination. We have grown from a very small number up to 4,000.

10962. Can you give me any idea of the rate of progress made by these examinations and the increase in numbers? It has been rapid, has not it?—We do not expect it to be so rapid in future. The examinations are no doubt stiffer, and we have some special subjects. They cannot pass them, perhaps, and more go back every year.

10963. This year you had 400 coming for the fellowship, had you?—Yes, about that.

10964. And ten years ago how many?—200 or 300. I did not bring the details with me.

10965. I wanted to ascertain whether your examinations were more numerously attended?—Yes, they are.

10966. Has your Institution noticed whether the quality of the candidates has been affected at all by the educational

facilities that have been given in the country during the last 15 years?—Yes, I think so. We have found a great many of our best men have come from these schools. From Cirencester we have had many excellent members now, and from Wye and other colleges. We find that the technical and practical instruction that they get there is of very great service to them in passing the examinations. Of course a great many pass direct from surveyors' offices and they study, for perhaps, two or three years with a man who coaches them.

10967. You prefer one from the Institution rather than one taught privately?—Yes, I think so. They are more grounded in practice than the others. As to private candidates, I mean men who have been coached for a short time only. We feel we are on safer ground with the colleges.

10968. Then you have indicated your appreciation of the value of examinations not only by making it the only means of entering your own profession but in other ways?—It is not the only means.

10969. Practically so?—Of entering our Institution, but not of entering the profession.

10970. You have also indicated your appreciation of the value of examinations by raising the standard of entrance. That has been the tendency, has it not?—Yes, that is so.

10971. I attended the meeting of the Committee of your Institution who were making arrangements for the scholarships to be held at Cambridge, and I found that your Committee had very high educational ideals and set a high standard?—I am very glad to hear it.

10972. I take it that they represent the general body?—Yes.

10973. I may say as a matter of fact that their standard was one that could only be reached by an exceptionally good student. They require the student to take an honours degree and also a diploma in agriculture within three years, and only a good man would be able to do so?—Yes, the scholarships are limited to certain conditions. We wish to have great ability for every grade, because they are certainly the crown of the edifice.

10974. Your idea in these scholarships is to secure a certain number of able young men with the best training that you can give them with a view to their entering the profession?—Yes, so that we should have the benefit of their knowledge in the profession. That is the intention.

10975. But all these men must be students of your Institution?—Yes.

10976. At the same time that they attend the University?—Yes, they are students at the same time.

10977. That is a very satisfactory arrangement from the educational point of view is it not?—Yes.

10978. (*By Mr. Medd.*) I think you complain of the quality to-day of the agricultural labourers?—Yes; speaking practically my own impression is that the agricultural labourer on certain work is very much more difficult to get than he was.

10979. In fact, the handy man and the man who can engage in skilled farm operations is almost defunct?—He is more difficult to get than when I was a younger man, say some 40 or 50 years ago.

10980. From all your wide experience, what would you suggest as the best way of dealing with that class?—That they should have instruction from the very first in the schools at which they are educated.

10981. You do not think it possible by any classes to-day to deal with the adult labourer, do you?—After a certain age, no. I think possibly that a course of lectures at the centres where there are younger men would possibly be good. But it is very difficult to teach an older man the technical and manual part of his work.

10982. That is quite true; the problem, in so far as the adult labourer is concerned, is practically insoluble?—Yes, in fact I have had a great deal to do with fruit cultivation, and I hardly ever succeed in making a good fruit pruner of a man who did not begin young.

10983. Then your remedy is to teach the boy and girl how to use hands and eyes when young?—Yes; and I should like to see a school garden of some description attached to every parish.

10984. That is one of your suggestions here, is it?—Yes.

Mr. G.
Langridge.
25 June, 1907

10985. It would be admirable, you think?—Yes.

10986. Would you suggest that the local authority or the parochial body ought to provide the land; because that is the difficulty?—I should not have thought there would be so much difficulty in obtaining land for that purpose. It would be either the county council or the parish council.

10987. What is your county?—Kent and Sussex are my two principal counties.

10988. One knows that Kent stands first to-day in rural education. There is no question of it. Your village schools are superior to those in any other part of England, and you have no difficulty in acquiring land apparently; but you would suggest that as a rule the attachment of, I may say, a quarter of an acre would be sufficient?—I should not like to say a quarter of an acre was sufficient, but it is better than none at all. I should have thought rather more would have been better where you could interest them.

10989. I was coming to the differentiation of two classes, and I may as well come to it now. You speak of children between the ages of 10 and 15; but 15 is an age rather beyond the elementary school age, is it not?—Yes.

10990. You have therefore to consider the requirements of children from 10 to 13?—Yes.

10991. And 13 to 15?—Yes.

10992. You will agree with me that a quarter of an acre is sufficient for an ordinary school for a child from 10 to 15?—No doubt, but even there for the smaller children it would be better to have more. But it depends on the school. For a school with 150 to 200 children a quarter of an acre would be hardly enough, I should have thought.

10993. Then in regard to that particular grade of education you would advocate continuation schools, would you not?—Yes; interest them when young and continue the interest when they leave school.

10994. In your continuation schools you would make the instruction both in the agriculture and in the workshop as practical as possible?—I should.

10995. That is, it would be in direct relation to the particular industries of agriculture and horticulture?—Yes. In a county like Kent poultry and dairying ought to be taught, and fruit growing too.

10996. How far would you be prepared to advocate compulsory attendance at such schools under certain conditions?—I think, if it were made part of the school training, it would be a good thing. I think it ought to be considered a very material and important part of the education at such schools, and so the masters and mistresses should think. It should be part of the educational teaching, not much every day, but some every day.

10997. Then you used the term practical knowledge of manual farm work and practical farmhouse work, and spoke of those subjects as being suitable subjects for children between 10 and 15?—Yes.

10998. Would you not be disposed to agree with me that for a child in an elementary school a practical knowledge of manual farm work and practical farmhouse work is rather out of place?—I do not think so for children from 10 to 15.

10999. But for children from 10 to 13?—Where there is a garden plot you could not begin the child too young.

11000. But that is not practical farm work?—For instance, if it were required to show them how to make a hedge or how to hoe turnips, it should not be shown by a person knowing nothing about it.

11001. All one is aiming at is, so to say, to get an opinion from you as to the desirability of giving a sound general education to the child in the first instance?—Yes, that is so.

11002. You agree with me in that?—Yes, and agriculture should be regarded as as important a part as the other part.

11003. There your technical training in agriculture

should be based upon as good a general education as you can give him?—Yes, exactly.

11004. In fact in your profession more than in any other, I imagine, you have found that the defects of the candidates have arisen from the want of general education?—That is so, and they have in practice very little agricultural education at all. I will not say the scholar does not know a cow from a horse, but there is a general ignorance on agricultural subjects.

11005. Now in regard to the training of teachers at Wye, in Kent, you have done a considerable amount of that kind of work towards the training of new teachers?—Yes, in Kent and Surrey for many years, but the great difficulty, in my mind, is the shortness of the course.

11006. Perhaps you will agree with me again that if they could receive this instruction upon Saturday afternoons throughout the year, it would be far more beneficial than having it compressed within a fortnight during the summer?—Yes, undoubtedly it would be so. But I think for a scholar to qualify for a parish school he ought to have a two years' course, at least, before being admitted.

11007. That is the desirable thing at present. Now you may know, and I hope in Kent you will advocate, the scheme provided at Wye of a special third year's course for elementary school teachers?—Yes, there is that now.

11008. At Wye, certainly. They are getting two institutions in Kent at present, recognised for that purpose?—At Uckfield they give a twelve weeks' course.

11009. But that is not for training teachers?—Yes, I understand it is for the training of teachers.

11010. It is a course extending for a whole year, is it?—Yes.

11011. I hope you will, so far as you can, encourage your local authority to release the teachers in such a way as to enable a portion of them to obtain that instruction?—Yes.

11012. Now you know the schools at Chislehurst Road, Orpington?—Yes.

11013. And at Orlestone?—Yes.

11014. They are excellent schools, are they not?—Very good, and most excellent for both boys and girls.

11015. I have myself sent educationalists from France, Holland, Belgium, Japan, Canada, and the United States, to see these schools, and the schools under the Macdonald scheme in Canada are based upon your schools there?—Yes.

11016. Have you met with this document in connection with that. (*Document handed to the witness*)?—This relates to Cirencester.

11017. Yes, and that is very valuable information indeed, is it not?—Yes.

11018. That is excellent as a piece of literature?—Yes.

11019. Many members of the Surveyors' Institution were educated at Cirencester, were they not?—Yes.

11020. And they have given satisfaction?—Yes, those colleges have passed more than the average.

11021. In regard to forestry, its facilities are enormous, and the result of its instruction has been considerable?—Yes.

11022. I mentioned the point because it needs emphasis, and because Cirencester is the only private institution conducting this work, with the exception of Aspatria, without the slightest aid from either Government or local authority?—That is so.

11023. (*By Lord Barnard.*) May I sum up what you have stated by saying that you would be inclined to suggest that this Committee should report that so far as scientific and technical instruction in these higher branches is concerned, the provision made is satisfactory?—I will not say it is sufficient.

11024. I did not say sufficient, but satisfactory?—It is satisfactory.

11025. But so far as the elementary and lower branches are concerned, it requires a good deal of supplementing?—Yes, it requires a good deal of supplementing.

TWENTY-SECOND DAY.

Wednesday, 26th June, 1907.

PRESENT :

The Lord BARNARD (*in the Chair*).

The Lord BELPER.

Lord MORETON.

Mr. DAVID DAVIES, M.P.

Mr. F. D. ACLAND, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. W. GOARING called and examined.

*Mr. W.
Goaring.*
—
26 June, 1907
—

11026. (*By Lord Barnard.*) You hold the office of Lecturer in Horticulture to the Education Committee of the County Council of East Sussex?—I do.

11027. How long have you held that appointment?—Fifteen years.

11028. That is from the beginning, almost?—Almost.

11029. The Committee have had a considerable amount of evidence from those holding similar positions to yourself. I dare say you are aware of what has been done in other counties?—To some extent.

11030. Therefore I hardly think it is necessary, at any rate as far as I as Chairman am concerned, to ask you to go through all the various items of the work that has been carried out in your county, but I should like to ascertain from you whether there are any special features of your work to which you would like to draw the attention of the Committee?—I will give you just the special features, if I may. In the first place our education in horticulture, perhaps, may be considered of a twofold character. We have our college for East Sussex, where we have the sons of farmers and tradesmen.

11031. That is at Uckfield?—That is so. I am there for two days of the week, and the remaining three days of the week I am in the rural districts amongst the villagers. We have about five acres of garden and orchard land attached to the College. The students attend the lectures in the morning, and they are forced to do practical work in the afternoon two days a week in these gardens and orchards. With regard to the work in the rural districts, the indoor lectures begin in October and they continue until April. The class of people who attend are farmers, estate agents, and the rural population generally. I might, perhaps, say that the established market gardeners and the fruit growers do not look upon horticultural education altogether favourably. They fear further competition.

11032. Is the whole expense borne by the County Council?—Yes.

11033. Then the people who attend the lectures pay nothing?—No, nothing.

11034. Is the door thrown open to the public—can anybody walk in?—Exactly.

11035. Are you sure that you always get the right people?—As a rule we do; people will not trudge along country lanes to attend a lecture out of mere curiosity. Of course, I do not say that everyone derives benefit from them. Some years ago we used to charge a fee, but we aimed at educating the working classes, and where a man earns 13s. a week, if you ask 3d. from him to attend a lecture, he will say, "No, I will not go." Threepence does not appear much, but it is a great deal to a working man. Therefore we had some trial lectures that we threw open, and they were well taken up, and they have gone well ever since. Our average attendance is about 40 per night.

11036. To take a typical rural district such as you are

referring to, are there many farm labourers in such a district?—Yes, they are mostly farm labourers.

11037. Are they large farms in your county?—They are principally country estates. We have a large residential population, and in a great many cases they would be labourers employed on the estates of the rich people.

11038. These men have gardens generally attached to their cottages in that part of the county, I suppose?—Yes, and in places, of course, there are some small holdings, and when you get near to the towns, where the scenery is not so good, we get farmers proper; but in the districts where there is good scenery the estates are principally owned by private people, and they live there.

11039. What do these labourers grow in their gardens—how do they use their gardens—do they consume the produce, or do they sell it?—If they are a long way from a town centre they usually consume their own produce, beyond, possibly, some potatoes that they might sell; but directly we get near to a town, where there is a chance of disposing of produce, then we find some of the best of them gradually acquire more land and become small market gardeners.

11040. You have large towns on the coast?—Yes, that is the principal outlet.

11041. I think you have not any large towns in the centre of your county?—No, the outlet is along the south coast. We get a large number of people in the seaside towns there in the summer time.

11042. Except for the coast towns, the county is principally a residential county?—Except the coast and the Downs.

11043. Are the farms principally sheep farms?—Yes. In order to further educate these people in the rural districts with regard to fruit growing, we found they could not all get to the Uckfield College—these agricultural people are slow to move away from their own parishes—and we established five centres for growing fruit on trial. These plots are a quarter of an acre in extent, and there is a mutual agreement with regard to the cultivation of the trees. The establishment of the plots cost the county about £15 each, and they are worked in this way: The county buy the trees and do the washing and the pruning, and the farmer does the cultivating and finds the farmyard manure. The county pay a nominal rent for these plots, and the farmer will have the fruit in time; but we reserve to ourselves the right to have 12 fruits from each tree for research purposes, if we want them, so that by having these plots we can show the people which kinds will do best in each particular district, so that they need not go and buy the wrong sorts in the future, as they have done in the past.

11044. How long have these plots been established?—Some have been established for three years and some for two years.

11045. Not long enough yet to be of any great value?—

Mr. W.
Goaring.

26 June, 1907

No; but three out of five of them have been extended by the property owners, and there is another one on the Marquis of Abergavenny's estate, which is going to be extended a further seven acres this autumn.

11046. You cannot get in three years any great scientific results?—No; but we are quite convinced that it will answer, and we are taking time by the forelock.

11047. You have five acres attached to the College at Uckfield?—Yes.

11048. Is any of it grass land, or is it all cultivated?—It is nearly all cultivated, but we have grassed some down for the purpose of showing the difference between a crop on cultivated land and on grass land, and that difference has been most marked.

11049. Do the reports on these fruit stations and things come up before the Education Committee?—Yearly.

11050. Are those reports discussed at all—is interest taken in them?—Yes, but as you rightly said just now, the plots have not been established long enough to be of any great scientific value yet.

11051. Is the work that has been done at the College fully discussed by the Committee?—As far as my department goes, it is.

11052. Although your county is a residential county, I presume there are a certain number of ordinary tenant farmers both large and small in the county?—Yes, a great proportion of these estates are let off, and we gradually get a very much better class of farmer; we find that the younger farmers are a very much more enterprising class of man than the old ones—a very different class altogether.

11053. Do they grow fruit on these farms?—Yes, in many cases they do, and there is a tendency to plant more fruit trees.

11054. You have some suggestions to make as to how your work can be developed and improved?—Yes. In the first place, as far as what I might term the better class sons of farmers are concerned, they should be taught in some way to use their brains better than they are now. The system of elementary education somehow does not seem to encourage them to use their eyes, and they do not seem to acquire the power of observation.

11055. You are speaking of farmers' sons?—Yes.

11056. I suppose the sons of these farmers that you are speaking of go in the first instance to the elementary schools?—I think so.

11057. Do any of them go on to the secondary schools?—A few, whose parents can afford it.

11058. A good many do not?—That is so.

11059. How do you suggest that that should be remedied?—By offering increased facilities for attending the secondary schools and granting scholarships to suitable applicants, if they need them.

11060. Who should grant those scholarships, do you think?—I take it the funds would come from the county.

11061. Your idea is that this Committee should urge that the County Council should provide scholarships to enable, at any rate, the most intelligent of the elementary school children to get further and improved education?—Yes, the brighter lads.

11062. Do you suggest that education should be of a general character or of a technical character?—Both; when I say general I mean to say they should go to the secondary school and they should get a further insight into ordinary education; and with regard to the technical character of their education there should be in some way plots of land, so that they could see examples of cultivation carried out upon them. Those remarks would apply to the sons of farmers who will ultimately become employers of labour.

11063. Your next suggestion is: "A well organised system of education by travelling lecturers and demonstrators for the benefit of the rural population generally?"—To my mind we must do something for the sons of the labourers who, perhaps, will have to stay in the villages all their lives. If we are going to keep the people on the land, I suggest that a well organised system of education by travelling lecturers and demonstrators for the benefit of those persons in rural districts who cannot attend any college or central educational institution should be instituted.

11064. Lecturers and demonstrators in what subjects?—I am dealing with my own subject.

11065. Quite so—you do not propose that they should

give lectures on Shakespeare, for example?—No. Another suggestion is the formation of fruit and vegetable trial stations in districts where they are required; that is to say, where there is a likelihood of horticulture increasing; I would form plots somewhat similar to the five we have now, and let them be conducted on similar lines.

11066. Is that suggestion intended to apply to the whole country?—Yes.

11067. You do not limit your proposals to your own particular county?—No; I make that proposal in order to educate the sons of the working classes, so that they shall become better and more intelligent workmen. Another suggestion is the establishment of evening winter classes for lads, to be followed by the cultivation of fruit and vegetables on the individual plot system in the summer; that is to say, we would have lectures in the winter, working to a syllabus, and in the summer the lads should carry out practically what they have been taught theoretically the previous winter.

11068. Do you think you would get the working boys in the county districts to come to these classes?—If you get hold of them when they leave school, before they have had time to get into loose ways, you will get them.

11069. I suppose in the country districts when a boy, has done his work he goes home and washes and has his tea?—Yes.

11070. Can you get him to come out again, except to loaf about the village?—In country villages it has become quite the usual thing for the owner of the village or a property-owner in the place to establish a parish hall, a working men's club, and that is the rendezvous for these lads at night. Those are the places where we find the lectures take best, and we get the lads there.

11071. You know, as a matter of fact, that they do go to these places?—Yes, I am giving lectures three nights a week in the winter, and I have done so for 15 years, and the establishment of these village halls is one of the best things you could have in country villages. The young fellows go there instead of going to undesirable places.

11072. You have limited your observations so far to boys. Have you considered any proposal as to dealing with girls?—I have not.

11073. Are there any other suggestions that you would like to make?—With regard to the education of the sons of these farmers, provided they went still further and attended some agricultural college, as far as I am aware the education in the colleges now is to a certain extent of a theoretical nature; there is a vast difference between learning how to grow a thing and how to turn that produce into money. A man may be a first rate cultivator and a very smart man, and may be able to grow some splendid crops, but unless he has some business training he will not be able to turn that produce into money, and I suggest for these more advanced youths, if they are going into business for themselves, that there should be connected with each college a tract of land, say, from six to ten acres where horticulture can be carried on, not from an experimental point of view, but from a commercial point of view, where the produce could be grown as a producer would grow it and be sold in the ordinary way of commerce. A lad now may have a first rate training, but directly he starts in business for himself he is lost when it comes to a matter of selling his produce. These salesmen and the men who have been buying have been accustomed to business methods, but the man who has had nothing but college education is not accustomed to business methods, and to my mind all the experimental gardens in the country will not make him a business man.

11074. You are thinking principally of fruit growing, I presume?—And vegetables.

11075. Not of farming in the ordinary sense of the word—not of stock breeding, for example?—No, I am alluding to my own subject.

11076. (By Mr. Latham.) Are you not taking the work out of the father's hands? The father, certainly, ought to teach his boy the business part. We are getting to a very low ebb if we are obliged to teach the young agriculturist how to be a commercial man?—But we get many men whose fathers are employed in the city, who have no material to teach them upon.

11077. You are talking of a class now who are not horticulturists at all?—Yes; because we get lads whose parents are not engaged in horticulture.

11078. (By Lord Barnard.) You think it would be rather hard because a father earns his living in the City that he should not have, if he wished it, some of his sons educated

Mr. W.
Goaring.
—
26 June, 1907
—

on the land?—Yes, and I think this plan of having five to ten acres of land where the commercial side could be taught as a finishing touch to his education would be of very great advantage; the father would probably lose any money that he might lay out for his son if the boy did not have that finishing touch.

11079. Is that all you have to add?—I think so.

11080. You told us that you work two days a week in the College?—Yes.

11081. That is, lecturing in the morning on theory?—That is so.

11082. The boys devote the afternoons to practice?—Yes.

11083. What is the nature of the lectures—budding and grafting, and that sort of thing, and chemistry?—Not chemistry—the chemist takes chemistry.

11084. Yours is purely horticultural work?—Yes; the first year we dealt with garden soils, draining, working the land, suitable manures for various soils, suitable crops, suitable seeds for vegetable culture, raising and pruning various fruit trees, and the cultivation of various vegetables. The students mostly come for two years. This is a copy of the syllabus (*handing same*). You will see there the subjects for the second-year students. That is an outline of the lectures for two years.

11085. Have you followed up any of your former pupils in their after careers at all?—Yes, we have several of them about the county now.

11086. Do you know whether they are doing well?—Yes, they are doing well.

11087. As fruit growers?—We teach horticulture as an adjunct to farming. We do not do it as they do at Swanley. We go in for fruit and vegetables only.

11088. As you have told us, every farmer grows more or less fruit?—They do.

11089. You think, commercially, in after life, the course of instruction that you give them is an advantage to them?—Undoubtedly, and to the property-owner as well.

11090. In the case of a man whose father has been a fruit-grower and farmer, do you not think that the lad learns his business partly by observation of what goes on in his own home, and partly by a sort of hereditary instinct?—Quite so, but he need not go to this piece of land unless he chooses.

11091. That is only for those who have not got the opportunity of learning it practically at home?—Yes. I have seen so many cases where lads, when they come to deal with their produce, fail.

11092. Have you thought of any system of apprenticeship—of a lad learning fruit growing under a practical man by being apprenticed to him, as is done in so many other businesses?—Possibly it might answer.

11093. One suggestion made to us with regard to farmers was that it would be a very good plan if the County Councils were to provide scholarships in the nature of apprenticeships really, and to select a good farmer, and to give scholarships to those lads who were likely to benefit from them, and put them with that farmer to work under him and learn the business by being in daily contact with the farmer on his farm?—That would meet my case if a very careful selection was made, but unless a very careful selection was made we should get back again into the old groove.

11094. You would say it must be a *sine qua non* that the farmer should be a progressive man, and not one of the old type?—Decidedly.

11095. I see from the Report of the Board of Agriculture on another county in England that the County Council lecturer pays visits to private gardens and allotments, and gives advice; do you do anything in that way?—We do not touch private gardens; they must look after themselves. We go to market gardens and allotments and not to private gardens.

11096. Do you not think such a system might be useful?—It might be, but we contend that if a man can keep a private garden he can afford to keep it going himself.

11097. You mention in your syllabus insect and fungoid pests?—Yes.

11098. The owner of a private garden can keep his garden going so long as the insect and fungoid pests do not come along and ruin it. The private garden owner usually is a large ratepayer, and do you not think he is entitled to advice if he pays for it through the rates—

perhaps you have not thought of that aspect of it?—I have not.

11099. I have had some experience of that kind in connection with forestry, and we find the advice we have got has been most beneficial; however, you have not considered that?—I have not.

11100. (*By Mr. Norman Lamont.*) You said in reply to Lord Barnard that you do not pay visits to private gardens; does that apply to market gardens and allotments?—No, I was only referring to private gardens, a private garden maintained by an owner for his own private use.

11101. Do you visit allotments for the purpose of giving advice with regard to insect and fungoid pests?—Yes, it is my duty to do that. My arrangement is this, that if a farmer can afford to pay the travelling expenses, I am to charge it to him, but if he is a poor man, a small allotment holder, the expenses are charged up to the County Council.

11102. (*By Mr. Davies.*) Is the question whether the market gardener or the allotment holder to whom you give advice is to pay a fee or not left entirely to your discretion?—There are no fees. It is simply the bare out-of-pocket expenses, and whether those should be charged to him or not is a matter for my discretion.

11103. So that you cannot get any financial support for your work from that source?—No.

11104. Do you not think if you were to charge a fee that you might be able to employ an assistant, who would also go round and give advice as to diseases, &c., and thereby assist in developing your work?—I am afraid if you made a charge they would rather let the enemy go on than ask us to come and advise them about it.

11105. You told us you thought the young men before they had finished their training ought to have some sort of commercial experience on special plots?—Yes.

11106. Could not you bring that about better by some system of co-operation amongst the farmers themselves?—In what way? I did suggest to have these lads at some central institution to be maintained by the county—for the brightest lads, or the sons of people who could afford to put them into business.

11107. I thought your point was that they were not able to sell their produce to advantage after they had finished their training, and it seems to me that if they co-operated they would be able to open up a much better channel for the disposal of their produce than if they attempted to deal with it individually?—Decidedly they would, but even then they want instruction in business ideas. If the whole co-operative body consisted of men without business ideas, I am afraid they would not move very fast.

11108. (*By Mr. Medd.*) What is the duration of your winter course—how long do the winter classes last?—Five weeks. We go to each successive place for five weeks; five Wednesdays, five Thursdays, and so on.

11109. Have you thought of developing them so as to form a winter school of horticulture?—Yes, we have thought of it. Those winter schools seem to take very well in colder counties, but in Sussex we get such mild winters that we find they do not take very well.

11110. We have had very interesting evidence here with regard to the winter schools in North Holland, where the climate is inferior to the climate in East Essex; have you heard of those schools?—I have.

11111. They work in a co-operative method of production and distribution, and they are able to sell their produce at a profit at Covent Garden when our fruit in Kent and Sussex is rotting on the ground?—I quite believe that.

11112. You know that to be the case?—Oh yes.

11113. Do you not think it would be worth while to make an effort this winter in some most favourable locality, to establish what I call a permanent winter school of horticulture—you have broken the ground already?—Quite so.

11114. You have told the Chairman that your classes are widely appreciated?—Yes, we get an attendance of about 40.

11115. Do you not think you would be doing a great deal of good not only in your own county, but as an example to the rest of the country, if you could establish what I call a permanent winter school for the county?—It is certainly worth consideration.

11116. I hope you will consider it, and if you have any spare leisure I would suggest your visiting such a school

as the one at Naaldwyck, near the Hague, in Holland. You would get there and back in three days and be able to spend a day there, and I am sure you would see from the whole organisation that it is quite applicable to this country. It is no use my explaining their methods just now, but if you should happen to go you would see exactly what they do, and I would be pleased to give you an introduction, and to see that everything was placed at your disposal for obtaining the fullest information; I think it would be quite worth your while to go.—Thank you very much.

11117. You have, I understand, central, or village halls in the country districts?—We have.

11118. You could utilise those for the permanent winter school. I understand you do not have many school gardens in Sussex?—That is so.

11119. What is the reason for that?—It does not seem to meet with the approval of the powers that be in Sussex. It has been brought before the Committee several times but nothing has been done and, latterly, since the 1902 Act came in, the pupil teachers have had the great share of the "whisky money," and we have had nothing with which to establish them.

11120. The school gardens would come entirely out of the elementary rate?—Yes.

11121. With all your horticultural interest, do you not think for purely educational reasons, as distinct from technical reasons, it would be worth while trying to establish gardens at a few of the most favourably situated schools?—It might, possibly, but I am bound to confess that I have had no experience of school gardens. I have been in Sussex for 15 years, but we have never had any.

11122. You live next door to Kent?—Exactly.

11123. In Kent they have excellent school gardens?—I believe they have.

11124. If you were to go to the Orlestone School, or the Chislehurst Road School at Orpington, you would get the very best idea in England how to conduct such a school garden, and the expense is infinitesimal. It amounts practically to nothing, and of course the object there is educational, not technical?—Quite so.

11125. I see you do nothing for the training of teachers?—We do not.

11126. Could you not utilise Uckfield for that purpose?—That is a question for the Committee.

11127. You cannot have an efficient school in any respect unless you have a properly-trained teacher?—That is a question that is hardly for me.

11128. It is worth consideration; you realise of course the necessity for instruction in packing, grading and generally in business methods?—Quite so.

11129. It only occurs to me now to mention that as one of the essential subjects connected with such a winter school of horticulture as I suggest, I should start with one only, and select a locality for it where you have aroused most interest?—Yes.

11130. Do you send any of your girls to Swanley—you mentioned Swanley?—I know nothing about the girls.

11131. You do not know whether any girl scholars are sent from your county?—No.

11132. Have you visited Swanley?—I have given a number of lectures there.

11133. You have seen there that there is very effective horticultural instruction given?—Yes. My experience was when I gave lectures there that the girls really worked better than the boys.

11134. They are only girls there, and if you go down there now you will see the finest lot of girls at work that you ever saw in your life?—No doubt.

Mr. W.
Goaring.

26 June, 1907

Professor J. R. CAMPBELL called and examined.

11135. (*By Lord Barnard.*) Would you kindly tell the Committee the appointment you hold?—I am Assistant Secretary in respect of Agriculture under the Department of Agriculture and Technical Instruction for Ireland.

11136. For how many years have you held that appointment?—Since 1900.

11137. You are naturally, I understand, fully acquainted with all the circumstances of agricultural instruction in Ireland?—I am.

11138. You know, of course, the terms of the reference to this Committee?—I do.

11139. You have heard the subject discussed, I daresay?—Yes.

11140. You know the points upon which this Committee desire information?—Yes.

11141. You will not be surprised at all if I tell you that the Committee think it not only desirable but essential that they should know and report to the President of the Board of Agriculture in this country what is being done in the neighbouring isle of Ireland to carry out this agricultural work?—What I proposed to do was just to give a very brief statement of the agricultural education work of the Department, and then perhaps get into some description of the actual schools and classes that are at work. I do not think I need trouble you with regard to the constitution of the department, and the various methods by which funds are obtained. That, I think, is not necessary.

11142. No. I think, perhaps, when we have heard what you have said, if we consider it necessary we may ask you just one or two questions with regard to the constitution?—Yes. At the outset I may say the funds of the Department are approximately an endowment of £100,000 per annum. I think at the present time it is £107,000, owing to a certain interest on surplus having accrued. There is also raised by a local rate in every county in Ireland a total sum for agricultural purposes of about £32,000 per annum. The amount raised by the rate for all purposes is, I think, £39,000, but a portion of that is set aside for technical instruction in the technical schools, not agricultural instruction at all. I think last year the actual sum set aside by county committees of agriculture who

were appointed by the County Councils, who raise the rate, usually a penny in the pound—was £32,000. Perhaps I might briefly describe on what these sums are spent, and you will see how extremely difficult it is for me to separate it from the general expenditure that you in this country would describe as technical instruction in agriculture proper, because mixed up with all our schemes of instruction we have the application of monies for the improvement of live stock and a variety of other things, and it is exceedingly difficult to see what is technical instruction in agriculture and what is not. Take, for example, in Ireland, the live stock schemes; I think we subsidise close on 1,000 pure bred bulls. These cost the country about £15,000 per annum. Some people would not consider that agricultural instruction, but our Department does consider it agricultural instruction, because there are about 17,000 of these animals in Ireland altogether, and our object is to educate the farmer to use a better animal by placing out about 1,000 first-class animals in the country. We do the same with horses, with sheep and with swine, and with regard to the poultry instruction, we carry on very much the same system as you do in England, but associated with that we have about 500 farms for the distribution of sittings of eggs. That, of course, costs a good deal of money, but all that we call agricultural education, and if you desire it I will make a careful analysis of these figures, and take out just that amount under each heading which in this country you would consider as coming strictly under the head of agricultural instruction. I am not prepared to do that at the moment, until I know exactly what it is you require. I will just briefly run over the items upon which this endowment of £100,000 and this sum of £32,000 from the rates are spent.

11143. Do you mean that a portion of the sum raised by local rates is handed over to you to administer?—Yes, part of our fund is from local taxation and is not given to the County Councils to administer, as is the case in this country, but is given to the central Department to administer through County Councils on schemes approved of by the department, and it is given on condition that each county participating must raise a rate for the same purposes. No money is given to any county unless a rate is raised, and as I have said before, the usual amount is about 1d. which last year amounted to £32,000 for

Campbell.

26 June, 1907

agricultural purposes. Of the £100,000—I am dealing with the Department's endowment, not with the £32,000 raised by the rate—about half is given to county committees of agriculture for instruction in, and improvement of, livestock, for itinerant instruction in agriculture, for agricultural classes for young men, for poultry schemes, butter-making schemes, horticulture, and bee-keeping, prizes for cottagers and small farmers, subsidies to agricultural shows, the improvement of flax, for the administration of the Fertilisers and Feeding Stuffs Act, and the general administration expenses of the local secretaries of the County Committees. That takes up about half of the £100,000. The remaining £50,000 is spent directly by the Department and from time to time as the Department initiate central schemes and get them well established they are transferred to County Councils. The Department usually start all these schemes themselves, and once they are organised they hand them over to the County Council with an intimation that so long as they are administered well the Department will pay a proportion of the cost.

11143b Now to come to the second £50,000, about £10,000 is spent in supplemental schemes in the poorer districts in the west of Ireland; about 22 special agricultural instructors are engaged in those districts; there are 8,000 to 9,000 demonstration plots of various kinds in these poor western districts. A very large number of special bulls, boars, rams, stallions and Spanish Jacks are placed out for service. In addition, a number of schools for girls are established for the giving of girls instruction in farmyard lore, such as butter-making, cooking, gardening, poultry-keeping and so forth. Then as to the improvement of livestock the central expenditure is a sum of £7,000, for schemes of inspection of sires and so on. All the sires that are used for service are inspected by veterinary surgeons annually.

11144a Are those sires private property?—Yes; any person having a good sire can submit him for service provided he has first sent him in for veterinary examination. Then there is a central stud farm, and also a scheme for the registration of dairy cows. We are trying to establish a herd book of Irish milking shorthorns. All these account for the £7,000 that I have mentioned. Then agricultural schools proper take £18,000; on agricultural schools for girls is expended about £4,600; on forestry about £3,500; on agricultural organization £3,700.

11145 Is your agricultural organization society similar to the voluntary society in this country called the Agricultural Organization Society?—It is much the same thing; the Department subsidises it to the extent of £3,700, with representation on the committee.

11146a That is principally for the encouragement of co-operation?—For the encouragement of co-operation, and mainly for the encouragement of credit societies—very largely, at any rate, for credit societies. Then for the improvement of creameries, of which we have a large number in Ireland, for surprise butter competitions, which are held very regularly, and for inspectors, instructors, courses of instruction, etc., £6,000; for special investigations in flax growing, cheese making, barley experiments, potato experiments, pig feeding experiments, peat experiments, tobacco experiments, seed testing, analyses, cattle mortality, technical aid to industries, and fruit preserving and horticulture. The department have themselves planted on a commercial scale about 100 acres of fruit, and the management of that, of course, costs something—then poultry, instruction in the grading and packing of eggs, instruction in the flaying of hides, and a variety of other things, accounts for £9,000. The marketing of Irish produce in Great Britain in the form of shows of agricultural produce held at the various centres—Leeds, Manchester, Newcastle, Swansea, Cardiff, and other big centres—£3,000. Pioneer lectures—that is not under the County Council at all, but is done direct by the Department—£3,000. Detection of frauds in produce sold in Great Britain, £1,500. Detection of frauds in produce in Ireland, £700. Special assistance to shows, exhibits, demonstrations, etc., £2,000. Travelling of representatives of special committees, £200. Rural industries, £3,000. Grant in aid of manual instruction on domestic economy in rural districts £7,500, and Sea and Inland Fisheries and miscellaneous take up the balance. I have simply run over that to show you the variety of work on which all this money is spent and how difficult it would be for me to pick out any special item as applying specifically to agricultural instruction.

11147 It seems to me that the Department with which you are connected considers that the subject of agricultural instruction is so closely entwined with the general principles of providing information for farmers that the two can hardly be separated?—Quite so, and we apply

money for the direct improvement of stock. For example, at some of our agricultural schools we will supply them for the purpose of service with, probably, a high-class thoroughbred sire, costing perhaps £400 or £500, and also in the case of breeders of pure-bred cattle we will probably supply them with a high class stock-bull for service costing about £200 or £300. We regard that as an instruction. In everything we do the educational side is kept to the forefront, but I need hardly say that many of the recipients rather look to the favours than to the instruction, and there is often a conflict between us on that ground.

11148 Is any fee paid for this service?—It depends upon the position of the recipient; there are no fixed terms. One of the first, and, I need hardly say, one of the most important pieces of work the Department took up was that of providing systematic instruction in agriculture. The first year was largely devoted to studying the conditions and the facilities we had for carrying on the work. After a considerable amount of thought, and taking all the circumstances into consideration, the policy which the Department decided upon was as follows: first to provide 11148a at one central institution the highest form of technical education for the training of men who are to become teachers and specialists in agriculture. This has been done at the Royal College of Science in connection with a farm and agricultural college at Glasnevin. Some of these colleges are provided for annually in the vote and are not charged to the Department at all, but the Department provides some of them. The sons of farmers have three years' training there; they have to undergo an entrance examination and to undergo also a practical examination in agriculture. All these men have to be subjected to a test on the farm. They have to plough and partake in all the operations of the farm. Then they are trained as specialists, and they are then either used in our agricultural schools or employed by County Councils as itinerant instructors. That is the one school for providing the highest form of agricultural education.

11149 Do they take a degree at that school?—No, it is an associateship, exactly the same as at the Royal College at South Kensington, here—there is no degree.

11150 What is the number of students?—There have been trained, passed, after a three years' course, 34 men, and at present there are 29 in training. All these men find employment immediately under the County Councils. The 34 are now all at work under the County Councils or in agricultural schools, and the 29 men who are now in training I could find appointments for to-morrow, if they were finished, and I expect there will still be a demand for two or three years to come.

11151. (By Mr. Medd.) What is the total annual cost of maintaining the college?—Do you mean the cost per student?

11152. I only care for the total cost of maintaining the institution?—I could scarcely give you that; there are three faculties in it; the faculty of engineering, faculty of chemistry, and the faculty of agriculture.

11153. What would you estimate the total cost in reference to the faculty of agriculture to be?—I could work it out for you.

11154. Perhaps you could kindly send us that figure later?—Yes.

11155. I wish to compare it with the total cost of similar institutions in England?—Yes.

11156. (By Lord Moreton.) Might we also have the figures showing the average number of students?—Yes. The Royal College costs, I think, £11,000 per annum.

11157. (By Lord Barnard.) Where is the College?—It is in St. Stephen's Green, Dublin, and they are now building a new one. It is maintained by an annual vote from Parliament; this is not a part of our endowment at all.

11158. (By Mr. Medd.) The statistics in regard to the annual cost of maintenance are somewhere available?—Yes, it is in the annual Parliamentary list of votes for the year. I can easily get it for you—here it is. I have it here: salaries and wages, £11,573—this is the Treasury vote, you know; apparatus, £1,500; prizes, scholarships, and examinations, including summer courses, £3,579; travelling, £250; incidentals, £260; total, £17,162. That is the total cost of the institution, the Royal College of Science.

11159. That is for the whole institution, of which there are three faculties?—Yes.

11160. You have no means here of estimating the portion

of that which would rightly be attributed to agriculture? It would be a matter of some difficulty to apportion it, because you could not distinguish the students in the first year from agricultural students.

11161. You dovetail one into the other?—Yes, in the first year they study science without reference to agriculture.

11162a. You might be able to give me an approximate statement of that hereafter?—I think I could. That ends the Royal College of Science, maintained, as I have just pointed out, not from the Department's endowment, but out of the Parliamentary vote. The scholarships amount to one guinea per week. The fees are £15 the first year, £20 the second, and £20 the third. Then the second proposal was "To provide at least one high-class agricultural college which would form a stepping stone to men desirous of entering the Royal College of Science, as well as men, the sons of well-to-do farmers, who wish for an education to enable them to manage their own farms, and men who desire to become creamery managers, or who wish to have a special training to fit them as horticultural or poultry experts, stewards, land agents, or other occupations in connection with agriculture." This has been done at the Agricultural College, Glasnevin. That college has been maintained out of the Department's endowment; the cost of it is about £3,000 per annum. It maintains from 50 to 60 students, and the horticultural school attached to it costs about £1,000 per annum. It corresponds to the residential agricultural schools in this country, such as the one at Holmes Chapel, and some others.

11163. (By Lord Barnard.) Not to what are marked on that map as university colleges, such as Reading?—No, the Royal College of Science is of the university standard, and corresponds more to the education given at these centres on the map. But of course in Ireland we have only one college. We concentrate on one college instead of having many centres as in this country.

11164. (By Mr. Medd.) The college of Glasnevin is more of the intermediate type, such as Holmes Chapel?—Yes, more of that type. A man who is trained there would not be permitted to take up any appointment under the County Council, because he would not be considered to have had a sufficiently good scientific training.

11165a. 11165. (By Lord Barnard.) He would not be qualified as an instructor?—He is not qualified as an instructor. Then thirdly, "To provide provincial institutions at which young men who can be spared from the farm for one year can be taken in as apprentices, taught agriculture, both practical and technical, at a fee proportionate to their means." This work, which had to be delayed until teachers were trained, is now in progress at three such institutions, and the provision of others is in contemplation. These are described in the Department's publications as agricultural stations. At these institutions the young men who are taken in have to do a large portion of the work on the farm.

11166. Neither of the two institutions which you have previously mentioned have any land, apparently?—The Royal College of Science has no land, but the Albert Agricultural College at Glasnevin has; it has a farm of about 170 acres, and that farm is used by the Royal College agricultural faculty, so that the farm there serves a double purpose.

11167. (By Professor Middleton.) The Royal College has actually a field attached to it, has it not?—It has access to a field and has educational privileges there, but the farm is essentially the farm of the Albert Agricultural College itself.

11168a. 11168. I thought Professor Wilson had one experimental field?—No, he has simply the use of the whole place. The young men are taken into the Agricultural Stations just referred to for 12 months, beginning in October, and going on practically until the harvest is completed, so that they have practical work for 12 months. The fees are as follows: Where the aggregate valuation of the boy's parents or guardians does not exceed £20, the fee is only £3; where it exceeds £20 but does not exceed £40, the fee is £6; where it exceeds £40 but does not exceed £100, the fee is £10; where it exceeds £100 it is £15, and for apprentices who are not the sons of farmers, £20. You see the fee is graduated. We have a rooted objection to giving scholarships. We do not give scholarships. Everyone must pay something, and in order to meet the charges of those who, like the very small farmer in Ireland, cannot afford to pay, we reduce the fee to £3; it is to all intents and purposes a scholarship, but we will not allow anybody in without paying some fee proportionate to his means.

11169. What is included for the fee?—For that small fee he receives board and residence on the premises, and education, but of course he has to work more than half a day on the farm; he is called an apprentice to farming. Before he is admitted he must pass a preliminary examination of a very simple character, and what is more important, he must produce a certificate to satisfy the Department that he has good prospects of becoming the occupier of a holding in Ireland, and he must get the instructor for the county to sign a paper that he has attended his courses and has made satisfactory progress. I need hardly tell you that if we did not do that we would have these schools filled with all sorts of young fellows who would be reared at the public expense. As it is, we have some difficulty in getting boys and in getting these places filled. We only started it three years ago—it was the third suggestion in our programme, so to speak—and we have not got them filled yet, because the difficulties of getting in apprentices are very great. We consider if we only turn out 30 or 40 from these institutions, and that all those are actually going to take up small holdings, it is better than training a large number of young men who are going in for various appointments, and who may be using the school as a stepping-stone to some other occupation. We will not even employ the young men from these places for the County Council work. We have one of these agricultural stations at Ballyhaise, County Cavan, one at Clonakilty in Cork; we are just building a large one at Athenry in County Galway, and we have inspected land in half a dozen places with a view to establishing others. One of the reasons that we are not pushing on with them is that we have not yet been able to train a sufficient number of teachers for our work. The number of vacant posts in Ireland is still far in excess of the supply, and besides, I myself think we are going quite fast enough, and that three is quite enough at present. That is three types of schools that I have described. Then the fourth is, "To provide winter schools of agriculture where the sons of farmers could obtain technical training at small expense during the winter months, when they can best be spared from the farm work." Twenty-eight of these schools were in operation last year in 12 counties. These are not residential, of course. Before a county is allowed to start schools of that kind it must have had two years at least of the work of an itinerant instructor in the county in order to prepare the ground. After he has had two years' training there—I call it training, because we look upon it as much in the light of training for the men themselves as of instruction for the farmers—after he has had two years in the Royal College and two years itinerant instruction to farmers he is then usually allowed to hold systematic classes during the winter months for the sons of farmers who can only be spared for about 20 weeks.

11170. (By Mr. Medd.) Is it not the fact that one great reason for the success of the development in Ireland has been owing to your ability to bank sums annually, and not expend annually the total amount allocated to you?—I do not know that I could answer that in the affirmative at all. It is not quite fair to say, as I always hear it put, that Ireland is better treated than England in this respect. England is far better treated than Ireland, but it is because you give the money away to the County Councils. I want to make that point first. The total amount of money available for agricultural education in England is infinitely greater than that available in Ireland, because the County Councils in England get very large sums of money, which they may apply as they choose, but you put no compulsion on them. They may do what they like with the money, and the central authority have no control over them at all, whereas in Ireland it all goes through the central authority who has the power to withhold it from them, or give it to them according to the way they make use of it.

11171. Has not your work been facilitated by the fact that you have been able to bank and hold back sums allocated to you annually, rather than to expend the whole annually—you have been able to have a reserve fund upon which you could draw, as experience showed in what directions it might be most usefully applied?—Yes, it has helped us very much in the development of the work, because we were able to say in the early years, "You shall have no colleges until you have trained teachers; you shall have no agricultural schools until you have had itinerant instructors," and now we have got to what I will call the brick-and-mortar stage.

11172. That has been an enormous assistance to you in the development of your work?—Certainly.

11173. Probably you are aware that in England the whole of the sum allocated annually has had to be applied

Prof. J. R.
Campbell.

11169b

Prof. J. R.
Campbell.

26 June, 1907

annually, whether the local authority had any useful purpose to allocate it to or not?—Quite so.

11174a (By Lord Barnard.) You were dealing with No. 4, as to the winter schools of agriculture?—Yes. They correspond very much to the short courses that are held at some of the agricultural colleges in Great Britain, but they differ in this way, that they are held in the centre itself, in the rural districts. Usually a good rural centre is selected, and a room or one or two rooms are hired, and there the agricultural instructor or teacher sets up his classes for the winter. It has this great advantage, that if it does not succeed there is not any great expenditure on buildings or equipment. But we find that they are succeeding, and it is only the want of teachers that prevents it being spread over all the counties. Twelve counties have now taken up this work, and every one of the counties is willing to set aside money for it out of their rates, if the Department will permit it. Then No. 5 is—I am recounting the policy the Department sets itself out to do—
“To provide one central higher institution for the training of women in the domestic economy of the farmhouse, and in work which falls to the lot of women to perform in connection with the farmyard, as, for example, dairying and poultry keeping.” This provision has been made at the Munster Institute, Cork. That is a school for women only, where butter making, farm house keeping and dairying, and various other subjects are taught. The school costs £3,000 per annum. It is a residential school. There are places for 50 girls, and for the last four years I should say that we have never had less than 200 or 300 pupils awaiting admission. So congested has the place become that we have just recently purchased land for the establishment of another in the North of Ireland, which will be called the Ulster Institute. It is simply to relieve the pressure of the demand that exists for the training of women. These women very often become private dairymaids, and a very large number of them find employment as dairymaids in creameries, and of course in other work as well.

11175. (By Mr. Latham.) Do you have the same restriction that they must be able to find employment in Ireland?—No, we cannot make any restriction in their case, because they might get married; we cannot place restrictions upon them as we can in the case of the men.

11176. (By Lord Barnard.) Do they pay fees at that institution?—Yes, the payment at that institution is about 12 guineas per annum; it is in quarter terms; there are four terms in the year, and if at the end of the first or second term they are not making progress they are turned out. Some of the best of them are kept on for seven or eight terms, and they then find employment as teachers under the County Council and the county committees. I have never seen such a demand as there is for the class of education that is given at this school.

11177a The Munster Institute is not a new school, is it?—No, it is an old school that the Department took over. When the Department took that institution over they found that half the year it was for men and the other half for women, and the same at Glasnevin; and in order to better utilise these institutions one was equipped and staffed entirely for women and the other entirely for men. Then, sixthly, “To provide for young women education in domestic economy and farmyard lore at residential and day schools.” This has been done at a number of institutions, while the equipment of a number of others is under consideration at the present time, that is smaller schools dotted all over the country. The Munster School is more of a training school, and all over the country we have dotted down small residential schools taking in from 10 to 20 residential pupils and day pupils from the neighbourhood who may come in by train, or who may come in by donkey cart, and sometimes we provide a car to drive them in. There we have set down at any rate a first-class school in the centre of a populous district, and the girls who go there gain all the instruction which is useful to them in the work of the household and in the work of the farm; they are, so to speak, small agricultural schools for girls.

11178. How many of those have you?—At the present time there is one in Lough Glynn, in Roscommon; one at Westport; one at Claremorris; one at Portumna; one at Ramsgrange; and I think there are about five more than those I have mentioned.

11179. Altogether about eight or ten?—Yes, and some of them are in the course of construction.

11180. The object I had in asking was to ascertain whether you proposed to spread those all over the country?—Yes, they are now rapidly spreading, and nothing but the

want of funds will curtail their multiplication. Then the next is to provide a school of forestry for the training, not of expert foresters, but of woodmen. This has been done at Avondale, the home of the late Charles Stewart Parnell. We bought his property and house, and converted it into a residential school for foresters; we have levelled all the ground and planted it up in various plots, and we have bought some land in the neighbourhood, which is also being planted. There the apprentices do all the work on the place, and, in addition to board, they get a small sum a week. In summer they are not quite so busy, of course, when one cannot do so much planting or felling, and their work then is only in keeping the grounds clean and looking after the plantations.

11181. Do they have resident instructors?—Yes, there is a resident master who teaches science, and a resident master who teaches English and general subjects; and then there is an expert forester on the premises. The course is three years. All that, I may say, is done, more or less, under the direct supervision of the Department. Finally—perhaps I ought to have put this a little earlier, because it is one of the first things in our programme—to provide in each county, by a system of itinerant instruction in agriculture, horticulture, dairying, poultry-keeping, and bee-keeping, instruction for farmers and their wives, sons and daughters, who cannot avail themselves of other means of acquiring information. That has been done to a very large extent, and I think that every one of the counties has set aside funds for the purpose, although a few have not been yet able to get the instructors. I have already described how the agriculture instructor usually spends two years in itinerant instruction, and then, where the County Council wishes it, he may give systematic instruction in winter schools. Of course, that does not apply to the horticultural instruction, or poultry, or dairying, or bee-keeping, and that sort of thing. These men or women always remain as itinerant instructors, and never give systematic instruction. It is the agricultural instructor only who gives systematic instruction to the young men in these winter schools. Thus the Department have laid the basis of a graduated system of agricultural education by means of which the youth who is inspired by the work of the itinerant instructor may be able to obtain education in the local winter school of agriculture, from which he may graduate to the provincial agricultural school, thence to the Albert Agricultural College, or the Royal College of Science, according to his circumstances and his education. I may say that side by side with all this there is another side to the Department—the technical instruction side. That branch is carrying on simultaneously science instruction in intermediate schools, and we are beginning now in our agricultural schools and classes to find the advantage of technical instruction in these schools. At one time it was intended to go still lower with our agricultural education and to put it into these intermediate schools, but these intermediate schools are under an Intermediate Board and we would have had complications in the administration, so that that has not been done. In two schools only have we attempted it—one at Monaghan and one in Galway. Where we have grafted an agricultural side on to these intermediate schools it has not been so successful as one would like, and I am, personally, not in favour of prosecuting it until we get some better system of co-ordinating our system of education in Ireland. The same applies to the National schools. In Ireland our agricultural education began at the top with the Royal College and has spread down to the intermediate schools; we have only two of those at present as an experiment. We have never got into the National Schools—those are what correspond to the Board Schools in this country, largely because they are under commissioners whose work is in no way co-ordinated with ours. Of course, we could get to them, and no doubt they would be quite willing that we should give instruction to the boys in the National Schools, but it would interfere with their programme. The buildings would not always be suitable and at any rate up to the present, and pending the time when education in Ireland will be changed in some form or other, we have not attempted to give instruction in any of these schools.

11182. (By Mr. Latham.) When you speak of the system being changed are you speaking of agricultural education or general education?—The whole system of general education. That raises a very important question, and one, I am sure, which will be of interest to this Committee, that is, where are you going to draw the line between the administrative sphere of departments such as ours, or say between the Board of Agriculture and the Board of Education in Great Britain. Obviously, you cannot have the two bodies at work in the same schools, and yet agricultural education of some kind should be provided; perhaps not technical education—I would be opposed

to giving technical education in the elementary schools—but some form of education that would have a bearing on the agriculture of the country should be given in these National Schools, and whether that should be given by the Board of Education in England, or the Commissioners in Ireland, or by the Board of Agriculture, which is primarily interested in promoting agricultural education, is a question for consideration, and it is, of course, one that is of extreme difficulty. I think I have run over now the main heads of our scheme of agricultural education in Ireland, and if there is any question or questions relating to the other work of the department, I should be very pleased to answer them.

11183. (*By Lord Barnard.*) Have you formed any comparison between the system which you have just described to us and the system—I can hardly call it system; the want of system—in England, and do you consider that in England any such arrangements could be made similar to those which exist in Ireland?—As I have already pointed out, the main difference between the two systems is that in Ireland the Department insist first on the County Councils raising a rate before the Department will give them any of their endowment; in the second place they have retained within their hands the full control of every penny that is spent by the County Committee, and if you were at the beginning of your work in Great Britain, I would certainly say, from my experience in Great Britain and from my experience in Ireland, that the system we have adopted in Ireland is infinitely superior to the one that you have here.

11184. But is it not also very much more costly from an administrative point of view?—I do not think so. You, certainly would require a larger central office and a larger number of clerks, and you would require more inspectors, certainly, but beyond that I do not think it would be more costly; in fact, to my mind, it would be cheaper in the long run. Take, for example, such work as the agricultural experiments. There has been a vast amount of excellent work done in Great Britain in that direction. I myself took part in it and attempted to use the results of other institutions for educational purposes, but it was almost impossible to do so because of the want of co-ordination between the work of the different institutions. In Ireland the very first step I took, having had this experience in Great Britain, was to be careful to avoid any mistake of that kind, so that to-day all our agricultural experiments have been so concentrated that I could give you the results of them in a sixpenny telegram. That is because while we allow our agricultural instructors a certain amount of scope for experiments and investigations of their own, we have our official sets of experiments, which every instructor in the country must carry out, all on the same lines; we are thus able to collate the results in such a way that we can get far more good out of it for our farmers, even with our somewhat backward farmers—backward I mean in the way of not reading the agricultural press to the same extent as the farmers in this country. In Great Britain, of course, there is an Agricultural Education Association. I would hope great things from that body if it were encouraged to meet oftener and to attempt greater co-ordination of the work than has been attempted in the past, but I do not see how you will be able to co-ordinate the work in Great Britain as well as we are able to do it in Ireland.

11185. Do you think it would be a good plan if the Government Department were to assist and encourage that Agricultural Education Association more?—I think so.

11186. It is hardly fair to expect the teachers to do it at their own expense?—No. I think that body ought to be subsidised; if such a body existed in Ireland, we would subsidise it at once.

11187. (*By Mr. Medd.*) Is not the Agricultural Education Association in England purely a body of teachers?—It is.

11188. A body that might possibly be suspected of existing mainly to promote the interests of teachers?—No, I think for advancing research work; I was a member of it at one time myself.

11189. One of its prominent members confessed to me the other day that it did little directly to further agricultural education?—That is perhaps because it wants re-organising; it wants other people appointed on it if that is so.

(*Professor Middleton.*) I am a member of that body, and I must protest against Mr. Medd's insinuations.

11190. (*By Lord Barnard.*) You have drawn a very clear distinction between the system adopted in Ireland and that adopted in this country, but should not I be

justified in saying that the industries of this country differ so enormously from the industries of Ireland that you cannot say that what has been done in Ireland might equally well have been done in England, for the simple reason that agriculture, although, perhaps, most important, is by no means the only great industry in this country as it is, I understand, in Ireland, except, perhaps, up in the North?—Yes, but agriculture is also a great industry here apart from the industrial districts.

11191. You, yourself, lived in an industrial district while in England—in the North Riding?—Yes.

11192. There is the mining industry and the textile industry to be taken into consideration?—Quite so, but that does not affect the fact that you have got large tracts of land in England that are purely agricultural, and quite as agricultural as Ireland.

11193. Quite so, but do you think that these other industries would acquiesce in so large a proportion of public money going to the assistance of agriculture as is the case in Ireland?—Well, I am afraid not, because the industrial industries are so well represented in Parliament that the agricultural industry would come off badly. On the other hand I am one of those who believe that the towns ought to pay the country something for the large number of people the country supplies to the towns annually.

11194. (*By Mr. Norman Lamont.*) With regard to the "whisky money" you mean, I think, that the money which is intercepted from the local taxation account is already given to the County Councils?—Yes.

11195. And that we cannot, of course, take it back?—I believe not. It would be very difficult to alter it.

11196. You, I dare say, know that the Chancellor of the Exchequer has announced publicly that in future this money is to pass through the Exchequer. Do you not think, therefore, that it is possible, while the money already given to the County Councils cannot, of course, be taken back, that in the re-organisation scheme, which will, of course, be brought forward next year, it might be possible to make any increase of that "whisky money" accruing in the future contingent upon a rate being raised?—I was not aware of that fact. Certainly, if the County Councils are going to get any more money, I would strongly recommend that it be given on the same conditions that the Department of Agriculture in Ireland gives its money, namely, on the condition that a Council raises a rate of an equal amount, and formulates a scheme, and submits that scheme to the central authority, and in that way the central authority gets some control over the work and sees that the money is applied in agricultural education and is not diverted to other channels.

11197. With regard to the training of elementary school teachers in Ireland, there is, I believe, in that country, as there is in this country, no differentiation at all in the training of the teachers who desire to take up teaching in rural schools from those who intend to take up their life's work in urban schools?—No; there was at one time; at one time many of the teachers were taught agriculture, and in fact, before the Department came upon the scene at all there was an extensive system of agricultural education in Ireland, but for one reason or another it had all gone down. It was a system of instruction through the National schoolmaster, a system that I certainly would oppose utterly. Any success which we may claim for the work we have done in Ireland has been due to the fact that we will not recognise anybody as a teacher of agricultural education unless that person has really been well trained. That is the first and foremost point if you want to be successful. You must have them well trained. Again and again we have got into serious difficulty with County Committees through refusing to sanction the appointment of certain classes of instructors, but we have stood firm, and nothing but the most rigid examination will satisfy us. Even a man with a degree, without the other qualifications, will not satisfy us. The County Committees advertise these vacancies, and we get large numbers of applications from Great Britain and elsewhere, but even then, no matter what degree he has, the candidate must be subjected to a thorough examination, not only in technical knowledge but in practical knowledge, and it is by that means that we have managed I think to be pretty successful all along the line. If you once give way in the teaching of agriculture or any other subject, and employ half-educated teachers—I mean in our particular line of work—you are bound to have failure.

11198. I absolutely agree, but you would perhaps admit that nature study, for instance, may well be taught by the elementary teachers in the rural schools?—Yes.

Prof. J. R. Campbell.

26 June, 1907

Prof. J. R.
Campbell.

26 June, 1907

11199. And that a grounding in that in the elementary school would be an advantage ?—Decidedly.

11200. And would assist in the future agricultural instruction in higher grades ?—Quite so, I believe in that ; but my difficulty is this, and it is a question that we have often considered in Ireland, that the moment you begin to teach nature knowledge it too often degenerates into a sort of bastard technical education in agriculture and horticulture. It is so exceedingly difficult to get teachers, unless they are very well trained, to teach the subject without reference to technical agriculture and technical horticulture, and it so often degenerates into mere text book work—in fact, as I have already said, into a bastard form of technical education in agriculture and horticulture. But if it is taught properly, then, of course, every one of us will agree that it is an admirable training, and it does not matter, of course, what the boy is going to be—whether he is going to be a farmer or a shoe-maker, it is equally good that he should have that kind of instruction that you mention.

11201. It really depends upon the original training of the teacher ?—Yes, upon the training the teachers get, and I myself believe that one of the reasons why that very extensive system of agricultural education that existed in Ireland many years ago—because agricultural education began as far back as 1826 in Ireland—all came to naught, was mainly because the teachers were not trained.

11202. As to co-operation, we know you have done a great deal in your Irish Department of Agriculture to foster co-operation among the farmers, and particularly among the small farmers. I should like to ask you how that has been carried out, and how its advantages have been brought home to them ?—Of course co-operation in Ireland was started by a voluntary association, the Irish Agricultural Organisation Society, and it has only been in recent years, since the creation of the Department of Agriculture, that that body has got public funds. It is now in receipt of a grant of £3,700 per annum, but I may say the country is by no means unanimous with regard to the continuation of that grant. On the contrary, the question has been debated in our Council of Agriculture, and while there was a majority in favour of making the grant, there was certainly a very large minority against it, and the question will come up again at one of our future meetings, and whether the grant will be continued or not is very doubtful. You see, when you begin to organise societies you get into conflict with the trader, and of course, if the trader has a say, as he has in Ireland, in the administration of the funds, you can understand how there will be objections to the giving of money for organising societies, but of course as to the value of these societies there is no doubt whatever, and as to my view that the grant should be continued there is no doubt whatever. It ought to be continued. The form of organisation which to my mind is most needed in Ireland at the present time, and which we are devoting a good deal of attention to, is the organisation of credit banks ; that is to say, agricultural credit banks. We are making very considerable progress at present in the organisation of these societies, and they will be of immense advantage to these new occupiers who are now being settled on the grazing land.

11203. Those banks are all on the Raiffeisen system ?—Yes, all those banks are on the Raiffeisen system.

11204. (By Professor Middleton.) When your Vice-President was outlining the difficulties with which your Department was confronted in respect of education, he said the chief difficulty in all educational work was that the supply has to precede the demand. You have been seven years at work in Ireland. Have you noticed yet whether there is any distinct change in the attitude of the Irish people towards this question of technical education ?—I have been asked that question several times. People will say "What is the best evidence that there is a demand for your work, and that your work is appreciated." I say the evidence is that all these County Committees are clamouring to get more and more of it, and these County Committees are largely composed of farmers. The County Committee is appointed by the County Council, and it may co-opt others interested in the work, and the County Council usually delegates to that Committee full powers with regard to the rate and so on. My reply to the question is, that instead of there being a falling off in the demand, it is getting keener and keener every year.

11205. What branch of your work, in your opinion, most attracts these County Committees—is it the work of the agricultural instructor ?—The agricultural instructor, of course ; but there is no doubt that our live stock schemes are tremendously popular, horse breeding, cattle breeding,

and all that sort of thing. But it must also be said that there is not a County Committee that has not been ready for the last five years to appoint one or two agricultural instructors, if they could get them. When that pamphlet, from which you quote, was written—you will see there we say we propose two years for itinerant instruction in agriculture—we did not think there would be such a continuous demand for instruction ; we thought it would fall off after a few years, but, on the contrary, the demand has grown, and year by year the interest that is being displayed is increasing. Of course I look forward myself to the time when there is bound to be a greater demand for systematic instruction and less for the popular form of itinerant lectures, and so on.

11206. Your itinerant instructor also gives instruction in about 28 winter schools, I see ?—That is only in a few counties, mainly in the north, but that will spread to hundreds of centres when we get a sufficient number of teachers.

11207. What is the largest number of winter schools that you have in any one county ?—I think three.

11208. What is the largest number of agricultural instructors you have in any county ?—Two.

11209. Has every county got its instructor at present ?—Every county, I think, has ; there are some vacancies at present, because we have withdrawn the instructors for our central work. We recruit our central staff from these men from time to time, and we have taken away some of our best men for central purposes, and in some of these counties the posts are now vacant, but there is not a county that will not appoint a man at once if they can get him.

11210. How do you select your instructor ?—We select him first for his practical knowledge in agriculture, and then we give him three years' training at the Royal College, and the moment he gets his Associateship of the Royal College he is eligible to become an instructor.

11211. Do you take every one who has got the Associateship ?—Every one.

11212. There is no subsequent examination as to his power to teach, or anything of that sort ?—No. That of course is gauged as far as possible at the time he is selected.

11213. When a man comes forward who has not been trained by you, you subject him to an examination as to his power to teach ?—We do, and we have to, because you might not send us your best from England. The counties often advertise in the British press, and 20 or 30 people may apply. Some of them may be very good on paper, but we would not accept them for the particular class of work that they have to do in Ireland, so we hold an examination, and select three or four of the best. We then send their names down to the County Committee, and say : "You can select either of these, but you may not appoint any others."

11214. You made a reference in your evidence to the want of co-ordination in the experiments that were being carried on in Great Britain ?—Yes.

11215. You referred, of course, to your own experience, and that was prior to 1900 ?—Yes, prior to 1900.

11216. You know that, chiefly through the action of the Agricultural Education Association, a number of joint schemes were formulated and published ?—Yes.

11217. I think these schemes are pretty largely adopted now throughout the agricultural colleges ?—Yes.

11218. They are of course voluntary ; there is no power to compel them to be carried out ?—Quite so. We, on the other hand, have power to compel, and every one of our instructors must be in our association. I have some copies of our various schemes here, which I should like to hand in, if I may. (*Handing documents.*)

11219. As a matter of fact, these schemes are similar to the schemes of the Agricultural Education Association ?—They are of the same type.

11220. The only difference is you have power to enforce, and we in this country have no power to enforce ?—That is so. We pay all the expenses of our instructors to the conferences—you do not do that ?

11221. No, we do not.—Everything is left by you to the individual, and I think a society ought to be subsidised if it is going to carry on a good work.

11222. As you know, the members of this association live in all parts of the country ?—Yes.

11223. You have alluded to the difficulty in getting large attendances at committee meetings in this country, because men have to come at their own expense ?—Yes.

Prof. J. R.
Campbell.

26 June, 1907

11224. In Ireland you always pay their expenses?—Always, and we make their attendance compulsory.

11225. You have been yourself a teacher of agriculture?—Yes.

11226. You have studied in Scotland and also in Germany and I should like to ask you, from your observation of what is being done in England, Scotland, Ireland and Germany, if you could indicate to us any marked differences between our English system and the German system. What I am anxious to get at is this: how does the amount of work which is being done by the agricultural expert in England compare with the volume of work that is being done in Germany as you saw it when you were a student there?—Of course I was not prepared to go into those matters, but I may say that in Germany generally they devote far, far more attention to the scientific aspect of the question. In this country we are intensely practical. We are devoting more attention to the practical side. If you take the purely scientific side we do infinitely less, although if you take the practical side we are doing quite as much.

11227. That is to say, you in Ireland?—Well, in this country too; I am talking of the practical work. I am talking of the farmer's platform rather than of the platform of the scientist. Of that I am quite sure. Compare the work in the schools in England and France and their instructors. I think we are far ahead of them, but not in scientific researches; in their researches bearing on the subject they are far ahead of us.

11228. You mean rather that in what we may perhaps call our practical experiments and demonstration work for farmers, work which the farmer takes a lot of interest in, we are quite equal to them?—I think we are.

11229. In providing for the education of the small farmer, which is a practical development of the subject, how do we compare with what you saw in Germany?—Do you mean the farmer's son?

11230. The farmer's son?—Compared to the size of the country I think there are plenty of equally good facilities in this country to what you find now in many of the continental countries.

11231. That is as far as colleges are concerned?—That is as far as colleges are concerned.

11232. But when you come down, we have nothing to compare with the middle agricultural schools?—No, you have nothing in this country to compare, for example, to our agricultural stations. They fill a want in Ireland: you do not have them here, and you do not have the farm apprentice schools, but of course you do have here, as they have abroad, short winter courses.

11233. Of course abroad they are very much more developed?—That is so.

11234. (By Mr. Davies.) I think the Committee were very interested in your description of the agricultural stations. Could you tell the Committee whether those were run at a loss or otherwise?—Two of the stations comprise about 700 acres, the other is about 350; they are run as part of the live stock schemes. At these stations we keep horses, bulls and boars and so on, and of course it depends upon what you charge for them whether you run the place at a loss or not. The only one of these colleges that is run as a business concern is the Albert College. That pays its way; but on the other places there would be a considerable loss, of course, due to the fact that it is not run really for farming purposes. For example, at some of the stations you would find that a great number of rams are bought and kept for a year in order to become acclimatised to be sent to the farmers in due course. Then again you may find 50 or 60 shorthorn bulls waiting for the farmers to select from. In that way it cannot be said to be run at a profit. As I have said in one case, namely, the case of the Albert College, it does pay.

11235. Do the fees of the students cover the cost?—No—I thought you were referring to the farm.

11236. It is the fact, is it not, that the students when they leave these stations must take up farms in Ireland—why is that condition imposed?—Because the fee does not cover the cost of the education—because the boy may cost us £25 or £30 to educate, and we would not be justified in spending the public funds on a young fellow who is going to emigrate. We only spend money on the lads that we know are going to stay in the country, and help, in that way, to make an impression by their example, and in other ways, on the country in time.

11237. Is that a condition imposed by your Board or

by the County Council?—By our Board; the County Council have nothing to do with that.

11238. The fees are proportionate to the amount of the valuation of the parent's holding?—Yes.

11239. Does the fact that you do charge this minimum fee of £3 prevent the very small farmers from sending their boys?—There are some very small farmers in Ireland, and I have no doubt that even the £3 would be a bar to some of those very small farmers to sending their sons, but on the other hand there is an enormous number of medium-sized farmers, 20, 30, and 40 acres, and £3 is not a bar in that case.

11240. What provision do you make for carrying out research work?—Scientific research work we carry on in the Royal College of Science: practical questions are dealt with outside. Suppose there is a cattle disease requiring investigation, we would, perhaps, set up a hospital and give a grant of £200 or £300 as the case may be, and employ a veterinary surgeon to make an investigation into it. Experiments with cattle feeding we carry out at the agricultural stations. We have not made very great progress with the higher form of agricultural research, and you will at once see the reason why, and that is because we have only been at work since 1900, and it took us three years before we got men trained; two years were spent in itinerant instruction, and there has not been sufficient time yet for that man to have found his feet, so to speak. But we do carry on research by the professors in the college, and we frequently employ specialists outside the college staff. For instance, we had a disease among calves not very long ago, and we employed a veterinary surgeon from France, and fitted up a laboratory for him to investigate the matter. We have done the same with regard to other diseases.

11241. Do the farmers value your work; do they realise the indirect benefits which accrue from the instruction you give them, or is it simply because they do get almost a direct pecuniary benefit from your stock schemes and the other subsidiary work that you carry on?—Of course the stock schemes are distinct from the educational schemes but the fact that you have the same body administering them, and that that body of men have the confidence of the farmer in a way that county councillors have not got here is a great point that we have in our favour in Ireland. Then again there is the tendency of the farmer to follow a leader, and if you get a few leading men on these county committees the smaller farmers look upon it as an obvious part of their duty to follow them. Of course we have men who are indifferent, and so on, but the tendency of the small farmer to follow the leading men of the district is far more powerful than it is in this country, so that we do get a good deal of interest taken in these schemes.

11242. (By Mr. Latham.) You said at the commencement it was very difficult for you to divide your teaching, in consequence of the amount of money that was allocated to what I might almost call domestic purposes. Cannot you give us some idea of the amount of money that is allocated for these animals?—I could give you the exact amounts; I have them here before me. I prepare a budget each year for the expenditure in the twelve months. We get our grants made from the Agricultural Board in the middle of next month, and this is a budget I am preparing for them. I can give you from this document the exact amount which was set aside by the County Councils last year for the various schemes. You will remember that I said the Department spent £100,000—£50,000 for the county schemes and £50,000 for the central schemes; and I also mentioned that the County Councils raised a rate amounting last year to £32,000.

11243. Over the whole of Ireland?—Yes, every county, without exception. I can give you here the exact sums that have been set aside for the different schemes by the county. I could give you them county by county, but the total for Ireland will suffice, perhaps.

11244. Yes, the total for Ireland will answer my purpose. Will you give us as near as you can the amount that is allocated to horses?—I will give you every item; I have them all here. The total amount for itinerant instruction in agriculture is £11,366; these agricultural classes that I spoke of, £3,043; poultry keeping, £9,129—that includes instruction on these 500 farms from which the sittings of eggs are distributed; butter making, £3,280; horticulture and bee keeping, £5,147; cottage and farm prizes, that is for small farms and cottages, £5,782.

11245. Those are for cultivations, I suppose?—Yes. Then live stock £23,867.

11246. Would it be difficult to divide the live stock into

Prof. J. R.
Campbell.

26 June, 1907

the four different classes?—It would not be difficult, but I am afraid I have not got it here. I have mentioned the total sum that was ear-marked last year for that—£23,867. That is the sum of money which is to be given in premiums and other forms to the different classes of live stock, and to which the County Committee contribute out of the rate, and to which the Department contribute out of their funds; but the whole may not be required, and if any part is not taken up the Department retains its portion and the county retains its portion.

11247. That does not include the cost of the animals?—No, that is merely spent in improving them.

11248. Can you give that separately?—Yes, I can give you the amount actually spent in 1906—that is the amount actually ear-marked and promised. The amount actually spent in nominations to mares was £8,838.

11249. Do you take the male and female distinct there?—£8,838 was given in nominations to mares in this way; the Department hold every spring about 200 mare shows; the mares are brought in by the farmers, young mares generally, and the Department's inspectors examine the mares for suitability and soundness, and hand out free nomination tickets to the owners of selected animals.

11250. Certificates, may we call them?—No, simply a docket entitling the holder of that docket to have that mare served by one of the stallions which the Department have approved and "vetted."

11251. May we take it that all unsound animals are rejected?—Yes, every one. That causes a tremendous amount of ill-feeling all over the country, but all unsound animals are rejected.

11252. And a very great deal of good feeling, too. You take the females on one side and the males on the other?—We take the females in the case of the horses, but we also "vet" the stallions as well.

11253. You hold an examination of the mares and you give a bonus to them, and then you give a bonus also to the bulls?—That is right.

11254. Not to the cows?—No. In 1906 the premiums to bulls were £13,635. These are given in premiums of about £15 per bull. The owner of the bull must allow him to serve a stated number of cows at a shilling apiece, the price being fixed to compete with what is known as the scrub bulls of the county. At the end of the season there is a certificate given that the services have been effected and the owner of the bull gets the premium of £15. That was for the year 1906, but as I have pointed out the total amount ear-marked for the year 1906-7 is £23,867.

11255. What may be the return that you get from the fees?—The farmer gets the fees; we get nothing.

11256. That goes to the owner of the animal?—That all goes to the owner of the animal.

11257. Have you any price that you put on the sires—the horses?—What we do with the horses is this: we advertise all over Ireland that on a certain date the Department's veterinary inspectors will come round, and all animals that are wanted to be put upon the register, as we call it, all sound and suitable animals, must be submitted to the veterinary surgeon. If the veterinary surgeon passes the animal, if he says he is a high-class animal, the animal is put upon the register. That accounts for the animals in the country, but you will find when a map is prepared that there are large areas where there are no good sires. We send an inspector to Great Britain, and if a sire is found sound and suitable he is bought and sent over to Ireland and kept at our stud farm, and to induce farmers to buy good animals and import them into their districts the Department gives loans and grants, subsidies varying from £50 to £100, so that if a farmer wished to purchase a high class sire for, say, £200, he pays so much and he is able to obtain a loan amounting to two-thirds of the purchase price, which is repaid in annual instalments extending over five years with 2½ per cent. interest on the outstanding balance, the animal, of course, remaining the property of the Department for five years.

11258. Is he tied down to serve mares with that stallion at a fixed price?—Yes, by the Department.

11259. About what would that price be?—Two guineas is the usual price. Of course the services of these horses is pretty expensive in Ireland.

11260. I quite agree. Does the first cost of the stallion fall upon the farmer, or does the Department pay for the horse subject to the part of the purchase money that is found by the farmer?—The Department buys the horse outright first of all and then sells him on a loan system to the farmer.

11261. What do you do with regard to sheep?—With regard to sheep, that is the one live stock scheme that has not been a success because of the Sheep Scab Regulations, and of course, as you know, sheep are different from horses and mares and cows: you cannot bring them to the ram in the same way. We have accordingly abandoned the improvement of sheep, except in the form of giving prizes at the shows for them, and except in the western districts, where the sheep run in common. What we do there is, we buy large drafts of good lamb rams and keep them at one of the agricultural stations until the following year and let them out to the farmers as shearlings. We do not pamper them in any way; we sell them at a reduced price. We will probably sell him a £5 or £6 ram for £2; he does not know he is getting that advantage, he thinks he is paying full price, but as a matter of fact that is what we do.

11262. Instead of selling the flesh you think it more important to sell the blood?—We sell the blood, that is so.

11263. Now with regard to pigs, what do you do?—With regard to pigs this is what we do. Every farmer who has pigs of the right type for the bacon curers, because bacon curing is a very important industry in Ireland, enters on the Department's books that he has so many boars, and when the time comes the inspector goes to his farm and selects the boars and earmarks them, and anyone applying to the Department for a boar is informed where to go. The purchaser of a selected boar gets a premium of £2 to £5 at the end of the season.

11264. The farmer keeps the boars?—The farmer keeps the boars.

11265. What about the milk industry?—The chief expenditure in the milk industry is in improving the creameries. Of course, we have home butter making as well, but our great milk business is done through the creameries. We keep a staff of about eight instructors going round these creameries looking after the machinery and so on. We make plans and prepare specifications for them and report on sites, water supplies, and all that kind of thing, and we hold surprise butter competitions eight or nine times a year. Any evening I may give instructions for a telegram to be sent out at 8 o'clock the next morning to every one of these creameries, and the same day the creamery has to send up a cask or a box of butter to the Department and we get judges over from Great Britain to judge that butter and give prizes for the best. That is what we call a surprise butter competition. They do not know when their butter is going to be judged until they get the telegram to send it up.

11266. Having told us very nearly what you allocate to these several departments, would it be difficult to say what you have left now for agricultural education?—I have not finished yet. I was on live stock. Then we give subsidies to agricultural shows; we encourage the holding of small agricultural shows. On that there is spent £7,251 per annum. Then for the cultivation of flax there is about £800 spent. Those practically are the chief items on which we spend money through County Committees. The total that was spent in the year 1906 was £48,055. You will remember I said a little while ago that of the £100,000, we spent £50,000, but it was actually £48,055; the other £50,000 we administered directly from the central offices. All these things that I have been reading off to you are mixed up, partly agricultural instruction and partly a subsidy to the industry, so that it is extremely difficult to say exactly how much of it goes to agricultural education. Of course I could work it out for you and get at an approximate figure, if you wish it.

11267. Will you tell us what the county rates are to assist that?—Every county raises a rate; they must; it is a condition precedent to their getting anything at all that they should raise a rate. The total rate raised in 1906 was £39,583, and of that, as I have already showed you, £32,000 went to agricultural purposes, the balance going to technical instruction.

11268. What about would that be in the pound?—With the exception of four or five counties that raise one halfpenny in the pound, it is about one penny in the pound. There are 33 counties and one penny in the pound raises a little over £39,000.

11269. What about the amount you give towards your purely educational establishments?—In the budget which I have made out for this year it is a total of £18,580.

11270. Amongst how many institutions?—The Albert College, Munster Institute for women, Athenry Station,

Prof. J. R.
Campbell.
—
26 June, 1907
—

Ballyhaise Station, Clonakilty Station, Ulster Dairy School—that is the new Ulster Dairy School for women which I told you has just been started—the Monaghan School, and the Mount Bellew. That is eight institutions and the amount is £18,580. That is my estimate for the year: I am asking that sum of money to run them for the year.

11271. With regard to your teachers, they all have to pass the same examination, I take it for granted?—Yes.

11272. The teaching throughout Ireland is all on one basis?—Yes.

11273. That basis is laid down by your Department?—Yes.

11274. Who is your examiner?—Our chief inspector, Mr. Gordon, is the chief examiner, assisted by the Professor of Agriculture in the Royal College of Science, on whose report the appointment is always made.

11275. Are these examinations anything like our examination for the National Diploma?—Yes, except that our men have had a much longer training; our session lasts for nine months, and from beginning to end they have got practical work in the laboratories; that is more than is given in the university colleges in Great Britain. I do not say it is a higher standard, but we teach a little differently. The first year no distinction is made between those that are to be chemists or engineers or agriculturists; they get a very prolonged training in the fundamental sciences. Then in the second year the same thing is done; it is only in the third year, in their final course, that they get their agricultural instruction. To my mind that is a specially good system, and I think that we get more out of it than we should if we followed the plan that is adopted in all the institutions in Great Britain.

11276. (*By Professor Middleton.*) That course is a similar one to the course adopted at a good many of our institutions?—Yes, but your courses are not so prolonged. The amount of chemistry teaching you give in the University College here is very small compared with what we give. The student must sign the book at nine o'clock in the morning, and he must not leave the laboratory until four o'clock in the evening, and that goes on for nine months. It is a very substantial course.

11277. It is not more than at Aberystwyth, is it?—Yes, much more. They do not spend the whole day in the laboratories there.

11278. For the degree, yes?—At any rate, in any of the Universities that I am acquainted with, either at Glasgow or Edinburgh or at Leeds, our course is much more substantial.

11279. (*By Mr. Latham.*) When do these students get their practical education?—Before they come. When they first come to the College they have to undergo a practical examination. If they cannot pass it they are not admitted. They have to prove that they can perform all the ordinary farm operations.

11280. Do they go through an examination in practical work before they are admitted?—Yes, and we will not admit them unless they can pass that.

11281. Is there any educational standard necessary before they are admitted?—Yes, they have to pass an entrance examination consisting of English, then they have Latin, French, German, or Irish as another subject, then mathematics and the practical test in agriculture.

11282. Will you just read the practical tests out?—“Each applicant must have practical experience of one of the following: Agriculture, horticulture, forestry. Each applicant must have had substantial experience of practical work in connection with farming, gardening, or the management of woodlands. No technical knowledge will be expected. The examination may be written, oral, and practical. The subjects will include all the ordinary work of farms, gardens or woods, as practised in Ireland. On no account will a scholarship be awarded to a candidate who fails to attain a high standard in the subject he selects for this portion of the examination; while excellence in that subject will be taken into consideration in case of deficiency in one or more of the others.” That is the practical work. If he selects farming he must attain a high standard in that subject. We advise our inspector that no student is to be admitted unless he can demonstrate that he is capable of performing all the work of a farm, and over and above that, he is tested as to his general knowledge.

11283. That is to say, you leave to the practical examiner full discretion as to his ability?—Yes, full discretion.

11284. With regard to the first-class arrangements you make as to these animals, have the animals in Ireland improved?—There is no doubt whatever about the cattle having improved; we have tested that; every salesman in Great Britain and every breeder will tell you that they have improved very much; there is no doubt about the cattle, they are improving rapidly. It is a little difficult with regard to the horses, because the Boer war depleted us of the mares and, in fact, of good horses altogether for a long time, and I cannot say that the exportation of horses since is a sufficient guide to indicate the improvement. I have more doubt about the horses.

11285. To go back a little before the Boer War, your programme was in force, was not it?—No, it was just beginning then, you see.

11286. May I ask you to go back and tell us when the distribution of these animals began?—The distribution of these animals began in a small way, I am not quite sure how many years before the Department was created in 1900. The Royal Dublin Society had a sum of £5,000, just as you have £5,000 in this country, and they administered it for the improvement of live stock.

11287. Your country has been very celebrated for horses, at any rate all my life time?—Yes.

11288. How did they manage before the distribution of these sires began?—I think myself, although the Irishmen would not like me to say it, that a deal of their success is due to their soil and not to their management; that is to say, they have always had good horses in Ireland, and they always will. You can grow them right there.

11289. I rather want to make a comparison?—I could not go further back than that. Of course, in the earlier days some of the landlords took an interest in the subject, but now, of course, the Department of Agriculture is the philanthropic landlord, and they take the lead in the improvement of stock.

11290. May we take it that there has always been some department to assist in this respect?—No, I do not think so. There used to be, and there are still, a number of good horses bred in Ireland for racing purposes, and many of the landlords used to keep a good thoroughbred horse.

11291. You are not able to draw a comparison?—No, I could not draw a comparison. I could with regard to cattle; there is abundant evidence of that.

11292. Sheep you cannot say much about?—No.

11293. Pigs you can?—Yes, pigs have improved immensely.

11294. Have they improved in sort?—They have immensely, especially in the west of Ireland.

11295. Do you consider the position of the Irish farmer has much improved?—Those who have bought out their land, yes.

11296. Are your farmers principally men that have been farmers from father to son downwards?—Yes.

11297. You have not any great number of men who have been town men and have gone on to the land?—No—we do not want them—not at all.

11298. I did not quite catch your remarks to the Chairman when you were talking about the education from the elementary schools upwards. How is that managed?—There is no agricultural education at all in the elementary schools now. There was previous to the time when the Department was established. There had been, as I said, agricultural education in Ireland since the year 1826, and, in fact, Ireland was a long way ahead of Great Britain in that respect for some time, but for some reason or another it has gradually gone down, until when the Department took it over in 1900, all that remained was the Munster Institute, the Albert College at Glasnevin, and the Royal College of Science.

11299. The junior boys, when they first go to school, are not taken up by the Agricultural Department?—No.

11300. They are taken up by the Education Department?—Quite right.

11301. They are taken through the elementary schools in the hands of the Education Department?—Yes.

11302. Is that sufficient education to bring them high enough for your agricultural schools?—No, we do not think so.

11303. What happens then?—What happens is this, that we often get into our schools boys to whom we have to give an elementary education. In these agricultural stations we have to have a master to teach them English

Prof. J. R.
Campbell.
26 June, 1907

and arithmetic and all that sort of thing, which should not be necessary; the boy should come to us able to enter at once upon his programme of agricultural education, but we have not got that yet.

11304. Are there any secondary schools?—Yes, there are.

11305. Do they not go from the elementary to the secondary schools?—They do.

11306. Who pays for them?—There are grants given by the Intermediate Board.

11307. That is not exactly what I want to know. Are they paid by your Department or by the Education Department?—By another Education Department altogether.

11308. Virtually the elementary schools and the secondary schools are all prior to your agricultural education?—That is so.

11309. If these lads come to you in a backward state, you have got some sort of institution in which you can coach them prior to the time that you can take them in hand?—The intermediate schools do not come under the Department.

11310. I perfectly understand that, but when the boy goes into the elementary school and the secondary school he is on one side of the furrow?—Yes.

11311. Directly he comes to you he is on the other side?—That is so.

11312. If they are backward when they come to you and require an English teacher, on what line are they educated? Is it at another secondary school, or is it in your department?—In our department—that is part of the instruction they get at our school, but they could get that at the evening schools if they went to them.

11313. Is an educational test necessary before they can be taken on by the Agricultural Department?—We submit them to a test in English and arithmetic before they can come to the agricultural schools. That test, however, is not a very difficult one because we are anxious really to get at the boy who is going to be a farmer, and very often that boy has got the worst education at the elementary school. Therefore we would take him in with a very low standard of examination, and we improve his education if we know he is going to be a farmer, rather than pass him by and take a good boy in his place who is not going to be a farmer.

11314. That boy you would take rather more trouble with than with any other?—Yes, we spend all our time on that boy. We keep out all the others as far as possible.

11315. Do you find that they do stop on the land when they leave you?—This has only been in force now for two years, but we have a guarantee from the boy's parents, or his guardian, that they have got a farm, and they have to name the farm, and the itinerant instructor must certify that that is so, and also the parish priest that the boy intends to be a farmer, and to the best of our knowledge all the young lads we have are going, eventually, to farm in Ireland.

11316. What do you do for the Irish agricultural labourer?—The only thing we do for the labourer is in the form of itinerant instruction in horticulture, fruit growing and vegetable growing. We give prizes for his cottages, and we encourage him to cultivate his garden well and keep his cottage garden neatly, and, of course, the Department through another branch altogether teaches girls domestic economy, household work, and so on; that is in the main what is done for the labourer.

11317. You do nothing in the way of teaching them to be more proficient in their work like we do in some of our districts in England?—No. We subsidise ploughing matches, and we subsidise hedging; we give prizes for that sort of thing, but it does not amount to a great deal. I could not say it is a great scheme of work that is having a big influence in the country.

11318. I suppose you look upon it that the agricultural man, the farmer, ought to be sufficiently advanced to teach his men himself?—Yes. You see our farms are very small. We have more than half a million farms in Ireland, and a good many of those are under 20 acres, so that the farmer is practically his own labourer.

11319. Do you give any encouragement in milking?—Not to any great extent. I could not say that is a feature, or that it would be worth my while dwelling upon it before you.

11320. May I take it that the principal part of your bulls are now bred in your country?—They are now, but that was not so in previous years.

11321. Where did they come from?—From Great Britain—from Perth and Birmingham, and other places. I have certainly seen one-third of all the bulls at a Perth sale bought by Irishmen and brought to Ireland, but now the breeders of pure bred stock are increasing enormously in Ireland; you would scarcely believe me if I told you the numbers of people who recently have taken up breeding pure bred cattle.

11322. With regard to the horse sires, does that apply?—There is a very large number of them still bred in Ireland, but we import a great many.

11323. Is that principally from England?—Principally from England.

11324. (By Mr. Medd.) You have spoken several times of the developed state of agricultural education in Ireland as long ago as 1826?—There was a system in operation then.

11325. That system was capable of considerable development, especially in regard to the employment of itinerant instructors, I think?—Yes.

11326. In answer to Mr. Lamont, I think you attributed the decay of that system to the deficient supply of properly qualified teachers, did you not?—That was one of the reasons.

11327. The real reason is a political reason?—There was a political reason.

11328. You attribute it to the refusal of the Government of the day to allow grants to be applied in Dublin to the support of the industry?—Yes, that was the Financial Reform Association.

11329. That was a cause of the decay of what, under other conditions, might have been one of the most advanced systems of agricultural education in Europe at that time?—At that time, yes.

11330. So that whatever defects there might be to-day are not due to any indisposition on the part of the Irish themselves to have provided agricultural education for themselves?—Quite so.

11331. They were stopped by the English, politically?—They were hindered—not altogether stopped.

11332. For economic or political reasons?—Yes, the Financial Reform Association objected to it.

11333. I believe your present system dates from the report of the Recess Committee?—It does.

11334. You were not in Ireland at the time the Committee sat?—I was not.

11335. You are aware that no effort or expense was spared to ensure that the whole question of agricultural education should be thoroughly considered by that Committee?—That is so.

11336. The industry of agriculture was considered of such intense importance to Ireland, that, as I say, everything was done to secure an effective and effectual report?—I think that is so.

11337. You are aware, probably, that no report on any branch of agricultural education in England has been issued for the last 20 years—the last report was the report on dairy schools under Sir Richard Paget?—Perhaps that is so.

11338. You may take it from me that that is so?—Yes.

11339. That brings me to this point, that if such an organised system as yours is to be built up in this country, the same care both in regard to effort and money must be expended in order to ensure similar results?—You mean to get a good system?

11340. Yes, you must study the whole situation from every point of view, and you must spare neither time nor money, to ensure satisfactory results?—Quite so.

11341. Any attempt on the part of the British Government to-day to curtail an inquiry would defeat the very object for which such a Committee as this was appointed?—I agree with that. There ought to be a full inquiry and report, certainly.

11342. Your most valuable Recess Committee's report was due to the steps which I suggest should be taken equally in England; that is to say, an inquiry over every branch of the question, and the submission of every type of evidence, and so forth?—Yes, I should say so.

11343. Associated with your Department are various councils and committees, are there not?—Yes.

11344. Can you briefly describe to me the constitution of each of those committees and councils?—There is first of all a Council of Agriculture, two-thirds nominated by the County Councils, and one-third nominated by the Depart-

*Prof. J. R.
Campbell.*

26 June, 1907

ment. That Council is merely a body which meets twice a year and criticises the work of the Department; it has no powers of administration.

11345. No administrative or executive power?—No administrative power, but, of course, it has this power, that I have to answer to that Council for everything I do. They have not the power to censure me or to dispense with my services, or to withhold the money for the schemes, but at the same time I have to meet them and answer for good administration—that is the Council.

11346. It serves at the same time, I suppose, the purposes of a Consultative Committee?—It does. Then it selects from its numbers eight men, and these, together with four nominated by the Department, constitute the Agricultural Board. The Agricultural Board are the custodians of that £100,000 of which I have been speaking. Theoretically, that Board originates no schemes; the Department originates the schemes, brings them before them annually, and the Board votes the necessary funds.

11347. Has it any power of revision with regard to the schemes?—Yes, it certainly has.

11348. It has power to revise, but it does not originate them?—It does not originate them, and, theoretically, it does not improve them; it can simply say, "If you do not do so-and-so we will not vote the funds." In practice, of course, that never happens because we know the minds of these gentlemen.

11349. You have in addition a larger Board, have you not?—No, those are the two Boards—the Council and the Agricultural Board. Of course, I am talking now for agricultural purposes. There is also a Technical Instruction Board—that is a larger Board. We have the Council of Agriculture, which meets twice a year, and the Agricultural Board, which meets perhaps, once every two months, or as often as may be required.

11350. Do the schemes which are submitted to the various County Councils originate from the Council or from the Agricultural Board?—From the Department, not from the Board.

11351. These, I understand, are submitted to the Board before the money to carry them out is voted?—Quite so.

11352. In drafting schemes, do you submit a variety of schemes to each local authority?—No, what we do is this: In the month of June we ask the County Committees for their views as to the working of the schemes for the past year. These views when received are then taken into consideration by the Department, and a fresh scheme is drawn up for the coming year. That scheme is made as elastic as possible. It is a skeleton scheme, so to speak. For example, to take the case of subsidising bulls, we leave it to the County Committee to subsidise whom they please; they may give six to one rural district and two to another, and so on, as they think fit. They may put a valuation upon the farmer as to which is to have the privilege of sending his cows or his mares, but the one thing that we do settle is that the scheme shall be on the lines of a premium or a nomination scheme. That scheme is brought before the Agricultural Board in outline, and they vote the funds. The scheme is then sent to the County Committees. The inspector from the Department attends, and with his help the County Committee allocates its joint fund, the joint fund being made up of the portion from its own rates and the portion which the Department has promised in addition. They allocate that amongst the various schemes in August, and by September the whole scheme is in full working for the year.

11353. The local authority, I take it, discuss generally the requirements for the particular year and submit a draft outline scheme, which you approve or confirm, and finally return to them?—That is so.

11354. Does your contribution bear any relation to the amount levied locally by rate?—Up to the present our system has been this: It may be a scheme of agricultural instruction, or poultry keeping, or of live stock, as the case may be, and the money is voted by the County Committee; they say, "We propose to spend this year £2,000," shall we say, "on cattle." "Very well then," the Department say, if they approve of the details of the scheme, "we will pay five-ninths of the total cost"—that is, 25 shillings from the Department for every pound raised by rates; and to the poorer counties we say we will give three-fifths—that is, 30 shillings from the Department for every pound contributed from the rates.

11355. Of course that is extremely liberal?—Then at the end of the year the County Committees send up to the Department the accounts, and after they have been

examined by the accountants we send a cheque for five-ninths or three-fifths, or whatever the sum may be.

11356. What to-day is the total cost of the subsidies towards agricultural education and of administration?—That, as I said, is very hard to answer, because it is so mixed up.

11357. You will perhaps be good enough to send us the exact amount of administration, including this work in Dublin, inspection, such examinations as you conduct, grants made locally, and local contributions?—The cost of our central office is not on the endowment at all; it is a Treasury vote, and it comes up in the Civil Service Estimates each year. My salary, and the salaries of all the clerks, are not paid out of the endowment at all.

11358. May I take it that the conditions vary so widely that any comparison between the total expenditure in Ireland and England would be unsatisfactory and unreliable?—It would; the system is so totally different.

11359. What now is the exact relation of your Department towards the Agricultural Organisation Society?—At the present time the Department give them the sum of £3,700.

11360. I have the amounts; of course you are a great deal more familiar than I am with the struggle, and the meetings and Sir Horace Plunkett's address, and so forth, and the fact that he obtained a slight majority, and the struggle that is still going on. There is of course a slight difference between subsidising and co-ordinating the work of organisation and propagation for propaganda purposes, and subsidising a particular society in its trade relations. You remember Lord Carrington's letter?—I do.

11361. Does your Department to-day subsidise any co-operative society with respect to its trade relationships?—None at all.

11362. For instance, in respect to the improvement of creameries you spend the large amount of £6,000?—Yes.

11363. How would you differentiate strictly between money applied to propaganda and organisation purposes, and money expended in furthering the sale of produce?—Take the creameries; that money is entirely devoted to technical instruction in our sense of the term.

11364. None of that money goes into the exchequer of the creamery as a creamery?—Not at all. The only way it may be said to do so is in this way, that our instructors save the creamery considerable sums in the preparation of plans and reports on water supplies and sewage schemes. It does assist in that way, but not a penny of that goes into the finance of the business.

11365. At present the practice of the Department to subsidise the work of organisation is continued?—Yes.

11366. Although there is a difference of opinion, the weight of opinion is in favour of Sir Horace Plunkett's policy?—The difference of opinion was in the Council, and the Council has no power to compel the Board to withhold the money, except in so far as it represents public opinion; but the Agricultural Board, acting upon that vote of the Council, voted this year £3,700 to spend on the Organisation Society's propaganda work on condition that myself and one of the inspectors attends on the Executive Committee and supervises the expenditure. That is the only restriction, but none of that money goes in any way whatever into the businesses concerned. It is all spent upon organising.

11367. Of course it is a matter of opinion, but Lord Carrington's letter might be taken to imply a readiness to subsidise the trade industries of the societies?—No doubt, but we never do that.

11368. You are careful to draw a great distinction between the various types and grades of institution in your agricultural education?—Yes.

11369. You have spoken of those which answer to the Royal College of Science type?—Yes.

11370. And those which answer to the type of the school at Glasnevin?—Yes.

11371. With regard to Glasnevin, do you do anything there to-day for the training of teachers?—No.

11372. Not at all?—No, except that we train horticultural teachers.

11373. You used to train others there?—That was in the old days; now all that is transferred to the Royal College of Science.

11374. The intermediate agricultural station serves the purposes of what may be technically termed an

Prof. J. R.
Campbell.

26 June, 1907

intermediate agricultural school, something in the nature of the *école pratique d'agriculture*?—Yes, it is pretty much based on the French type.

11375. That I gather both from the Recess Committee's report and from one's own observation?—Yes.

11376. Do you find that grade of education is appreciated by the farming classes, and turns out good pupils?—It has only been in operation for two years, and I cannot say that it is appreciated as much as one would expect, but that is largely due to the heavy restriction that is put upon admission. I have spoken of the searching test, as to what is to become of that young man when he leaves us, and you can see that if that test were removed we would have these colleges filled to overflowing, but by applying that very vigorous test before admission it cuts off a very large number of candidates.

11377. I should think, if I may say so with deference to what you have already said, the question of fees is a difficulty. You have no scholarships which cover the cost of fee and maintenance?—No.

11378. What should you estimate the cost for maintenance of a boarder to be?—To feed him it costs 7s. a week—1s. a day; that is about £18 for his food—I reckon about £26, but I am giving you a rough estimate. I have not worked it out in great detail, because I have not those figures before me.

11379. In introducing a new grade of school you are imposing a rather heavy burden on a heavily taxed and impoverished class of people—the smaller Irish farmer is not very well off?—No.

11380. And to give up the services of his son from the age of 16 or 17 means a considerable sacrifice to him?—It does.

11381. Do you not think you could either through your local authorities or the Department, offer at least a few scholarships, say one in each county, possibly to include board and maintenance?—No, I do not think so. Suppose you did. Suppose you take the agricultural station at Ballyhaise; it is capable of holding say 50, and if we offered 25 free places in the way of scholarships, what would the result be? The result would be that you would have 25 pupils, and the other 25 would say, "Why should we pay? We will wait till next year and get a scholarship."

11382. You are perfectly right if you can popularise the school by showing its definite practical advantage to agriculture and to the farmer. That is the best method to proceed upon undoubtedly?—Yes; I admit it is not so easy to fill our schools as it would be if we adopted your plan, but we are working to a surer and more definite result in the end.

11383. Yes, I think you are wiser if you can do it without adopting the other plan. With regard to the winter schools, that is a type that we particularly want. Could you kindly describe in detail the organisation and work of such a school as Downpatrick, or you probably have a scheme illustrating the curriculum that you could send us?—Yes.

11384. The cost of maintenance, the terms under which pupils are allowed to go and to be housed free?—They are not housed; they are conveyed free. They either come in on bicycles or on the railway, or in some cases we provide a horse conveyance for them and bring them in.

11385. I think that course is about 22 to 26 weeks?—About 20 weeks.

11386. Could you kindly send us for insertion in your evidence the organisation, the curriculum, the results and the methods of dealing with the pupils, and the cost?—I will.

Thank you very much. [*The Witness subsequently forwarded to the Secretary prospectuses of the agricultural schools and stations in Ireland.*]

11387. With regard to the elementary schools, you have entirely dispensed with the farm schools?—Yes, because that is under the Commissioners of general education.

11388. Do they still keep any farm schools on?—No, there is nothing at all left of them.

11389. With regard to the elementary school, you do not desire anything of a technical character to be taught?—Personally, no. I deprecate anything that partakes of technical instruction to boys under 12 or 13.

11390. One can do much in the elementary school to develop intelligence and powers of observation by utilising natural phenomena in teaching without in the least degree trenching on anything technical?—I quite agree with that.

11391. You spoke of some confusion arising from schools being under different departments?—Yes.

11392. Are you familiar with the organisation in France and in Holland?—I know something of France; I do not know much of Holland.

11393. You are probably aware that the Board of Education, or rather the Ministry of Public Instruction, has charge of the elementary, the secondary, and the normal school there?—Yes.

11394. In so far as all that partakes of rural or agricultural instruction given in them?—That is for boys attending the elementary schools.

11395. And the secondary: that you are aware is entirely under the Ministry of Public Instruction?—Yes.

11396. When you come to deal with the rural and agricultural subjects technically, as in the *école pratique d'agriculture* and the national colleges, it comes under the Ministry of Agriculture?—That is so.

11397. It is quite easy to maintain that distinction if you keep before your mind that you are using the subject in one case educationally and in the other case technically?—I quite agree with that, but it wants very careful watching.

11398. So long as you have a clear view of your objects and your methods, there is no real difficulty in maintaining that distinction?—No, there is no difficulty, but there is great danger.

11399. You must prevent the two from overlapping, the teacher of capacity and the teacher who has to develop a particular type of character, and the teacher who is using a subject to teach a trade?—Yes, you want a clear definition of the duties of each department.

11400. They are not incompatible?—No, it is perfectly possible.

11401. That is the ideal scheme to prevent rivalry?—It seems the only one.

11402. (*By Lord Barnard.*) Does your Department deal with the diseases of animals?—Yes.

11403. And the restrictions and regulations and so on with regard to that?—Yes, we undertake a vast amount of work outside what I have been describing to you as the purely agricultural side.

11404. Do you publish any leaflets?—Yes.

11405. Have you reason to think that they are useful?—Judging by the demand for them I should say they must be; there is a tremendous demand for them.

11406. Will you tell me what the Agricultural Council is composed of?—As to two-thirds of members nominated by the County Councils, and as to one-third of members nominated by the Department.

11407. (*By Lord Belper.*) I have not had the advantage of hearing the principal part of your evidence. Have you spoken at all about research work?—To a small extent. I have pointed out that we have hardly yet got to the stage in Ireland when we may be said to have entered upon the research stage, because we have been training our own men. We began in 1900. It took five years according to our system before he was trained, and there has been only two years since, so that we have hardly got to that stage when we can say that we have entered very seriously on research work, but in our principal agricultural college, that is the Royal College of Science, there is a considerable amount being done, and as to the other forms of research we usually employ an outside man and give him a grant, and ask him to work up any special subject.

11408. Have you special funds for devoting to that, or can you get a grant from the Government for that particular work?—We must take it out of our own endowment; we have £100,000, and we must take it out of that.

11409. I suppose you would consider at all events in any college where any well advanced work was being done, that it was most essential that research work should be attached to that?—Most assuredly.

11410. And that that is a work that Government ought to encourage to a large degree if they want these colleges used to the best advantage?—I have no doubt about it whatever.

11411. I suppose in Ireland at present the research work you have been doing is of a somewhat elementary character, dealing particularly with local problems, I presume?—Yes, all problems specially applicable to Ireland, particularly diseases of animals that are a source of loss to Irish stock owners, and in various other ways. We have made

investigations with regard to creameries, the disposal of sewage, investigations with regard to tobacco growing, the manufacture of peat fuel, and a variety of forms of work of that kind. We have carried on very extensive investigations into the flax-growing industry. Those are all directly applicable to some Irish industry. We have not undertaken what you may call purely scientific research, but what you might describe as problems of general application to the whole country. We have to some extent entered into pure scientific research, but as far as possible it has had a direct bearing on some Irish problem. I recognise the need for an entirely independent research station that will devote its time and attention not purely and simply to Irish problems, but to agricultural problems of general world-wide interest.

11412. You, I think, gave very interesting evidence to

Sir Kenelm Digby's Committee when it was sitting?—I did.

11413. No doubt we shall have the advantage of seeing that when the report is published, as it very shortly will be?—Yes.

11414. (*By Professor Middleton.*) I understand that no part of the sum of £100,000, which you have spoken of, is used in connection with the administration of the Diseases of Animals Act?—No, theoretically all the administrative expenses are put on the annual Parliamentary Vote, although in practice the Treasury may be sometimes rather hard to move; and if I want an inspector or a clerk we simply dip into our own fund and do not wait for the Treasury, and take our chance of getting it from them afterwards.

Prof. J. R. Campbell.

26 June, 1907

Mr. F. O. SOLOMON, called and examined.

11415. (*By Lord Barnard.*) You are I believe the head master of the Dauntsey School in Wiltshire?—Yes. I went to the North of England in 1890 as the agricultural master in the North-Eastern County School and I worked in the North of England for ten years, chiefly as agricultural lecturer in the Armstrong College, Newcastle, and as lecturer in the counties of Durham and Northumberland.

11416. How long have you been at the Dauntsey School?—Nearly eight years.

11417. The school is at present administered under a scheme under the Endowed Schools Acts?—That is so.

11418. It is really based on a very ancient endowment?—Yes, by Alderman William Dauntsey, who died in the sixteenth century.

11419. It has been very generously subsidised by the Mercers Company since the date of the scheme?—It has been permanently endowed by the Mercers' Company.

11420. The object in view is to provide, would you call it, a secondary school with an agricultural bias, or is it a purely agricultural school?—It is an agricultural school. All the boys in the school receive a sound general education, and the boys in the upper divisions take a theoretical and practical course of work in agriculture and land surveying, natural science and so on.

11421. Then it is a secondary school?—It is a secondary school under the Board of Education; at the present time it is under the Board of Education.

11422. I do not mean what it is under. What I want to get from you is whether it is a school for the purposes of giving general education, including special education in agriculture, or whether it is an agricultural school pure and simple?—It is a school giving a general education to every boy; it is a secondary school; the ages of the boys are from 13 to 19.

11423. I have the scheme here. To go back to the first words you used, that it is a secondary school under the Board of Education, is the scheme carried out?—The scheme which you have in your hands is being amended; the Governors' suggested amendments are in the hands of the Board of Education and the Board are considering them now.

11424. So that it is in a state of transition?—Yes, but from the point of view of this Committee I think perhaps there is nothing very important under enquiry.

11425. Would this provision be effected: "Once in every year the school and the school plant shall be inspected, and the scholars shall be examined under the direction of the Board of Agriculture"?—Yes, I expect the Board of Education will assume those duties.

11426. (*By Mr. Medd.*) Your idea might be that it would be taken on as a technical day school by the Board of Education?—No, as a secondary school.

11427. Is the school not under the jurisdiction of the Board of Agriculture at all now?—No.

11428. (*By Lord Barnard.*) Then you ignore this provision in the scheme—you do not comply with it?—The Board of Agriculture has been inspecting the School every year since I have been there, but really our inspectors are now Board of Education inspectors.

11429. You receive no grant from the Board of Agri-

culture?—No, we do not receive any grant from the Board of Agriculture; we never have done.

11430. You are not in touch with the Board of Agriculture at all?—The Board of Agriculture is in touch with us, I think—I mean that one of their inspectors visits the school every year, and so on. The reason we are under the Board of Education—

11431. I do not want to trouble about the Board of Education, because that is rather outside our sphere. This Committee is appointed by the Board of Agriculture, and if you are in process of cutting off your connection with the Board of Agriculture any evidence you can give will not be of any great value to us, it seems, except on the subject of agricultural education generally. I do not think you need trouble yourself very much with the affairs and the position of the school?—Very well.

11432. (*By Mr. Medd.*) Is it not the fact that all your boys on attaining a certain standard, or age, undertake agricultural subjects?—That is so.

11433. So that you are not a secondary school with an agricultural side at all?—We are not a secondary school with an agricultural side. We are rather a secondary school with an agricultural bias.

11434. If one adhered to strict terms you are not a secondary school at all—you are an agricultural school?—We are bound to call ourselves a secondary school or we should not get a grant from anybody.

11435. You would as a technical day school?—I understand that we should get no grant from the Board of Agriculture, and we should not get any grant from the Board of Education.

11436. As a technical day school you would?—Does "day school" mean boarding school as well—do you mean in contradistinction to a night school?

11437. Yes.—Quite so: perhaps we should, I do not know.

11438. Is any practical instruction given at your school?—Yes, more or less.

11439. (*By Lord Belper.*) How much more and how much less?—It depends upon the age of the boy. We found that it was impossible to carry out the scheme in its entirety; we could not teach to boys of 13, and even those of 17 or 18 years of age, all the subjects enumerated in the scheme.

11440. Is there any land attached to the school?—Fifteen acres.

11441. For agricultural work?—Yes, and gardening and fruit cultivation.

11442. (*By Mr. Latham.*) At what age do you take these boys?—From 13 to 19.

11443. Do they come to you as soon as they have left the elementary school?—There are comparatively few boys from elementary schools.

11444. Where do they principally come from?—They are principally farmers' sons.

11445. That have previously been to another secondary school?—Yes, as a rule.

11446. But if not?—They would perhaps have had private tuition, or they may have come from a public school.

Mr. F. O. Solomon.

Mr. F. O.
Solomon.

26 June, 1907

11447. (*By Lord Barnard.*) Are you familiar with the finance of the school?—Fairly.

11448. Are you in any way responsible for it—does it pass through your hands?—No.

11449. Then I do not think we need ask you any questions on that point?—I know something about it.

11450. (*By Mr. Latham.*) Would you explain the fifth head of your *précis*—"The reason the school is placed under the Board of Education"?—That is a matter that has been the subject of very much consideration by the Governors—I mean as to whether the school should come under the Board of Agriculture or under the Board of Education. In the first place, the Board of Agriculture seemed to have no money at its disposal, and the Governors found that they would have to go elsewhere. The Governors have equipped the school very thoroughly; it is an exceptionally well equipped school; it is probably one of the best equipped schools in Wiltshire; the buildings are extremely good—and although I say it myself, there is a thoroughly efficient staff; and the Governors, quite rightly I think, thought that they were entitled to a grant from public funds. Another reason is that for boys of this age, from 13 to 18 or 19, a general education is after all the most important and first consideration, and so the Governors thought primarily they must give a good secondary school education. Another reason for the school coming under the Board of Education is the position of the assistant masters. I take the agricultural subjects myself, also natural history and land surveying and kindred subjects; my colleagues take the general school subjects, mathematics, English, and so forth, and for those men their position might become a little bit difficult. It is better for them to be under the Board of Education, because it keeps them in touch with the "world" of secondary education so to speak.

11451. (*By Lord Barnard.*) Should I be right in thinking that the case of this school is totally different from that of any other we have heard of; that is to say, in its inception it was an attempt to have a purely agricultural school and then for various reasons you now find that that is impracticable and inadvisable?—I consider it to be an agricultural school at the present time.

11452. What the Committee would like to ascertain is this: Should we recommend that purely agricultural schools should be established all over the country, or should we say it has been tried at West Lavington and it has been found desirable to have a good secondary school, with specialisation on agricultural subjects?—I think that similar schools to ours would be a success in other parts of the country; I think they are very much more desirable than agricultural colleges; but every boy, no matter what he is going in for, should have a good general education.

11453. (*By Lord Belper.*) Quite so, but you need not necessarily give it in the same place as you give agricultural education?—I think if you are giving agricultural education for boys of 13 to 19 that you would have to ensure that those boys, whatever school they attended, were also getting a good general education.

11454. In an agricultural college, I take it, the boys would have had a good general education before they came there?—Yes, but this is an agricultural school.

11455. We have been discussing agricultural colleges and agricultural education, and the general routine would be, would it not, to get boys after they have had a good general education, so that they could devote the whole of their time at the College for the purpose of learning scientific and practical agriculture, in which they are going to spend their lives in the future?—Yes, that would be so at an agricultural college.

11456. (*By Mr. Medd.*) I think you mean that this general education is essential for every pupil up to the age of 14 or 15, but that this school then takes them on in agriculture instead of any other subject, and it then assumes for boys of that age the character of an *école pratique d'agriculture*, that is, an intermediate school of agriculture, the only point being that for the purposes of grant-earning it has to come under the Board of Education; is that what you mean?—Yes, that is so. The boys in the first two forms in the school take no agriculture, or very little, and after that I consider that they are in a position to start their agricultural work, and they do so.

11457. General education is what you are giving them up to the age of 14 or 15?—Yes.

11458. Then they all join agriculture?—Then they all take the agricultural course.

11459. (*By Mr. Latham.*) Do you compel every boy to take agriculture?—I have no need to compel them; they do it of their own accord, because it is made attractive and useful, and they like it because for the most part they are boys who are going to be farmers, or to pursue some other rural occupation.

11460. (*By Lord Barnard.*) You mention here "Subjects related to agriculture that are taught at the school." What, precisely, do you mean by that?—Agriculture itself, such as the study of soils, manures, crops, live stock and so on, also horticulture, dairywork, and land surveying.

11461. The usual thing?—Yes.

11462. You have done nothing out of the ordinary?—No; the subjects are those usually comprised in an agricultural course.

11463. You wish to say something on the subject of boys being taught practical farm and garden work?—They have to take a certain amount of practical farm and garden work in their course.

11464. The words you have got down here are: "The extent to which practical farm and garden work should be engaged in by boys"?—I think for boys of this age it is a matter that requires very careful handling—I mean as to the amount of practical work they do.

11465. Perhaps you will tell us why you think it requires careful handling?—I find that the boys take a great deal of looking after when they are out at farm work, and I should not suggest that the younger boys should give much time to it; I think that it ought to be restricted to the older boys of the school, and that it should be restricted to a limited number of operations, and that those operations should be suitable for boys, and, if possible, should be operations that they will not have a chance of learning elsewhere.

11466. Some of the witnesses here have told us that the only place on which a young man can with advantage learn the practical working of a farm is on a farm, and that he can do it better on his father's farm than at any school. Do you agree with that?—I think a farm is the proper place to learn practical farming.

11467. You say, "Subjects other than agriculture should form part of the course"; what is your suggestion with regard to that?—Those would be such subjects as mathematics and English subjects, besides, of course, science.

11468. A good general education?—Yes, the subjects comprised in a good general education.

11469. Your next head is, "The age at which boys should commence their agricultural studies." What age do you suggest?—About 15, as a rule.

11470. For how many years should they continue them?—It should depend rather upon the boy's general education than upon his age. I would let him commence his agricultural course when he gets into a certain form in the school rather than let this depend upon his age—at least, that is the system that I adopt, and generally it is at about 15 years of age.

11471. "The type of students for whom an agricultural school is specially required"?—For boys who are going to be farmers or who are going abroad, or intending to pursue any calling in rural districts.

11472. As a matter of fact your school is not limited to boys who are going to follow those particular pursuits?—No, but of late years we have had few who are not going to pursue some calling of that nature.

11473. Perhaps you will agree with me that the boy who was not going to have anything to with rural life would not want to learn these special subjects?—Quite so, but when properly handled they are subjects of considerable general interest.

11474. I do not quite understand the last thing you put down here, "Opinion as to whether schools of a similar type to Dauntsey would be successful if established at other places"?—With regard to boys who are intending to take up rural pursuits, I hold they would derive substantial advantage from attending an agricultural school in preference to an ordinary school; and I believe agricultural schools in the country would be of greater practical advantage to the average farmer's son than agricultural colleges, because however desirable it may be for them to go through an agricultural college—and I have my doubts about that—the fact remains that probably five-sixths of the farmers of the country for many years to come will not go to an agricultural college, but they will all go to a school of some kind, and I think it highly desirable that it should be an agricultural school, that they should go to—

Mr. F. O.
Solomon.

26 June, 1907

a school like Dauntsey; I believe that thoroughly good work is being done at the school.

11475. Is not the aim of a school and the aim of a college rather different?—I take it to be so.

11476. Is not there room for both?—Undoubtedly there is room for both, but I think that the agricultural schools would have a very good chance of getting filled, whereas the agricultural colleges are at the present time not very full.

11477. (*By Lord Belper.*) Do you not think it would be better that we should take that from the colleges themselves. I do not think we can accept that as a general statement which is borne out by the figures which have been given us from the principal colleges?—I rather meant to imply that so many, many more people would go through an agricultural school than would go through an agricultural college.

11478. That somewhat depends upon the size of the school and the size of the college, and it also somewhat depends on the course in the school and the course in the college, and how long each pupil is going to stay there, and so on. I do not suppose you would pretend that in a school you could get the instruction in the higher branches of agriculture and scientific agriculture that you could get in a college?—No.

11479. They cover to a certain extent different ground, and a pupil who went to an agricultural school like yours would very likely, if he wanted to qualify himself, at all events for the higher positions in agriculture, have to go to a college as well; by higher positions I mean as a teacher of agriculture, or to fill some of the better positions abroad?—Yes, that is so, and I think that the agricultural school should confine itself to training farmers and not attempt to train lecturers and professors.

11480. (*By Lord Barnard.*) Have you not overlooked the necessity of the work that is done by these colleges and collegiate centres in passing pupils through to the higher branches of scientific knowledge in relation to agriculture. We have had evidence from no less than two places, Bristol and Birmingham, that they propose to take up now this higher agricultural work that you have not anything at all to do with?—Yes, that is so: I quite recognise the importance of such work.

11481. You must not limit the acquisition of agricultural knowledge to the teaching of little boys?—No.

11482. Should I be right in your opinion in describing the aim of the school to educate a boy for the ordinary walks of life, and the aim of the college to train him in some special branch of knowledge?—Yes, that is what the colleges do, of course.

11483. Supposing you had a great many more schools of the Dauntsey type, how would you get over the difficulty of providing for those boys who are not going to be farmers—you would have to duplicate secondary schools all over the country?—Of course, comparatively few agricultural schools would be required to take all those who are going to be farmers, and who could not go through an agricultural college.

11484. I gathered from you just now that you would like a great number of these schools?—Not necessarily a great number of them, but distributed over the country I think they would do a vast amount of good.

11485. Why do you want the agricultural classes to be treated differently from any other class? I am not aware that any other class find it necessary to have special schools for them as places of education as distinct from training. Take my own profession, that of the Bar; I never learnt any law at school, or at the University either, and I do not think any other professions do?—I feel that the education given at the Dauntsey agricultural school, is a good one for farmers' sons, and I think that it is specially appropriate to boys who are going to be farmers; that is my meaning.

11486. (*By Mr. Latham.*) Will you define what your teaching is from the agricultural side; I do not think we have found out what you do teach?—We give a course of lectures in agriculture and horticulture, and there is a course in land surveying and levelling and natural sciences, with a considerable amount of laboratory instruction, and also a course in dairying.

11487. I know a very great deal about practical agriculture, and I should like to have it defined what you teach; what do you teach them as practical agriculturists?—As far as we can go with boys of that age we teach them garden work, how to work in the garden and how to work in the field, grafting and budding and pruning and that

sort of thing, and they take part in the work of the cultivation of the agricultural plots.

11488. Do you instruct them in ploughing and sowing?—We do not teach them to plough.

11489. Do you teach them the valuation of stock?—As far as we can in the time; of course they leave us generally at about 18, so we do not profess to give a course similar to an agricultural college; we do not profess to go so deeply into the matter.

11490. Do you teach them anything about the ways of cattle?—Yes, as much as we can; we have the run of the farms in the neighbourhood by arrangement with the farmers, and I take the older boys in the school round the farms periodically.

11491. And ask them to value the cattle as to weight, and so on?—Yes, and we try to tell the ages of the horses, we see the cultivation of the crops, and that kind of thing, as far as time will allow us, of course.

11492. You have answered all my questions. Do not you think that every single one that I have asked you and that you have answered should be taught by the lads' fathers?—There are some of the things we teach them that I think the lads' fathers would not teach them.

11493. Just name one thing that you teach that you do not think the ordinary agriculturist would teach his son?—I do not think that he would teach him to prune fruit trees properly, nor graft, nor bud.

11494. That is rather more horticulture than agriculture; I am referring to agriculture?—I do not think he would teach him the dentition of farm animals—merely to take an illustration; I hardly think he would.

11495. You think the ordinary agriculturist of the present day is a very ignorant man?—No, my father was one, and I should not like to be thought to imply that.

11496. I am a farmer myself and I want to defend my class. I think the ordinary agriculturist is an excellent judge with regard to the dentition of farm animals?—I understood that the question was not so much what the farmer knew, but what he was going to teach his son.

11497. I would teach my son the dentition of farm animals. Do you think the instruction given at your school is as far advanced as the instruction given by the man that takes farm pupils?—I think you can hardly compare the course at our school to that, because our boys are younger; they leave me at about the age when they would go to a man as a farm pupil.

11498. After they have left your school for educational purposes you take them for, perhaps, two years on the farm?—They generally go on their fathers' farms after they have left me.

11499. What is left for you to teach them on the agricultural side?—The same remark would be applicable, surely, to an agricultural college, would it not?

11500. No, science comes in there?—We try to teach that; we have lectures and laboratories, and so on.

11501. Have you any demonstration plots?—We have experimental plots.

11502. Demonstration plots?—Yes.

11503. Where are they carried out?—Just at the back of the school, on the land belonging to the school.

11504. You do not go about from farm to farm; you do not take land in the adjoining districts and experiment in that way?—No.

11505. I suppose you have not any experiments on grass?—We have not any experiments in grass this particular year, but we have experiments in potatoes, corn, roots, and garden crops, and so on, and we publish the results each year in the school magazine.

11506. You are in connection with the Wiltshire County Council?—We receive a grant every year from Wiltshire.

11507. How much?—£100 a year.

11508. Do you receive anything from Hampshire?—No.

11509. You are only in connection with Wiltshire?—We receive that grant from them.

11510. Is that ear-marked for you at all?—It is a grant made each year to us.

11511. Is it for any particular purpose?—No, I think not; it is for the general school funds.

11512. With regard to the dairy teaching, what form does that take?—We get the services of the County Council instructress, who comes round regularly and gives a course

Mr. F. O.
Solomon.

26 June, 1907

which includes both theoretical and practical work. It is the Wilts County Butter School.

11513. Is the dairy work done at your school?—Yes.

11514. You do not have any travelling dairy?—The Wilts County Council have that.

11515. I perfectly understand that. You have nothing to do with the travelling school?—No, I have nothing to do with the travelling school.

11516. Nor the school?—No.

11517. You do not teach cheese-making?—A little cheese-making is done in the ordinary course when the County Council instructress comes.

11518. What is the length of time you devote to cheese-making?—It is generally amongst the boys who have already taken a butter-making course, and they, perhaps, take cheese-making instead, or partially with the butter course; we do not profess to teach cheese-making.

11519. You do not take them round to different farms and give them a general practical education there in cheese-making?—No; there are not any very near to us; I do not think I know of a farm very near where cheese-making is done now.

11520. Do you teach them any farriery?—For the last two or three years there has been no farriery taught at the school.

11521. I am really very much at a loss to know exactly what you call this agricultural teaching that you give to these young people from the practical side. Do you teach them anything about seeds?—Yes, we have a course on seeds and one on manures.

11522. Are lectures in agriculture given?—Yes; three or four lectures per week throughout the year.

11522A. By whom?—I give all the lectures on agricultural subjects.

11523. When these boys leave you, do they go through any practical examination?—No.

11524. Then, virtually, they are taught by you in your school and they are passed along without any examination to see whether your teaching has been proficient or not?—There is no external examination at the present time; the school is inspected every year; hitherto it has been an inspection carried out jointly by the Board of Agriculture and by the Board of Education.

11525. You give them no certificate?—There is no certificate.

11526. (By Mr. Medd.) As a matter of fact, your school is providing intermediate agricultural education?—Yes—do you mean between a school and a college education?

11527. Yes.—It certainly does not pretend to be an agricultural college.

11528. No, but it is providing a useful agricultural education; I have seen your excellent equipment, and you have plenty of available gardens and ground, and you are giving intermediate agricultural education; that is to say, education which an elementary school could not give and would not be appropriate for—between that and the advanced college?—Yes.

11529. I may say that the agricultural side or bias of your work has tended to increase?—Certainly.

11530. Until to-day it has monopolised the school. Each boy, after a certain stage, or age, learns agriculture?—That is so.

11531. Amongst your pupils you must have each year a certain number of exceptionally clever boys?—That is so.

11532. For whom it might be advisable that they should proceed to an agricultural college?—Yes.

11533. I suppose you would have no objection to work under a system under which you became responsible for the intermediate agricultural education of a certain area, and by which your cleverer boys proceeded to the advanced college serving that area?—Yes, that could be well done; it would be very useful to me.

11534. No county alone, you will agree with me, could to-day provide every grade of agricultural education desirable; the expense would be prohibitive?—Yes, it would be very undesirable to attempt such a thing.

11535. It would be very undesirable to have schools such as yours multiplied everywhere?—Very undesirable; one could serve an area of, I should think, three or four counties as a rule.

11536. In other words yours could quite well serve Wilts,

Somerset, Gloucestershire, and perhaps Monmouth?—Yes, probably.

11537. Basing would serve Oxford, Berkshire, Hampshire and Dorset?—Of course, we differ considerably from Basing, I imagine; we give the general education.

11538. You do. That is assuming Basing is capable of expansion and development on your lines. The point of my remark is that you are capable of serving that area, and the best lads could proceed to such a centre as Cirencester for the advanced instruction?—Yes, if that could be done it would be a very good thing.

11539. It would enable that white patch on the map to be really better coloured than any other section, because you would have your elementary school serving the intermediate school and the intermediate school serving the advanced college?—Yes; I always have two or three sharp boys who are capable of going ahead.

11540. I think there has been a little misapprehension this afternoon with regard to your aims. Would it not be a good thing to allow the Committee to see your school and see what you are doing?—I should be very glad, indeed, if any members of the Committee could come down at any time.

11541. (By Lord Barnard.) Might I add that it would be also of great help to the Committee if we could see any draft scheme which is in course of preparation now, and which is likely to become law, so that we may really be able to appreciate the exact position of the school?—Yes, I think it would.

11542. (By Mr. Medd.) I am afraid that you have rather conveyed the impression that the school is in a more or less undefined state, and that you do not quite know what your aim is?—Of course, I cannot speak quite definitely on some matters, seeing that the scheme is *sub judice*.

11543. If you would allow the Committee before it reports to see your scheme and allow the members of the Committee to see the school, it would be better in everyone's interest and, certainly, the better in your interest?—I should be very glad to see any members of the Committee if they could come down.

11544. (By Professor Middleton.) In answer to Mr. Medd you said that you often had boys whom you would like to send on to an agricultural college?—I have one or two most years.

11545. In the case of those boys would you adopt the same course of study as you follow with the remainder of the school?—I think the boys who are going on to an agricultural college ought to take no agriculture while they are at school at all.

11546. That is just what I should say, too?—I am bound to admit that.

11547. Boys going on to an agricultural college ought to take no agriculture at school at all, you say; what ought they to take?—They should get a good general education whilst they are at school to fit them to understand thoroughly the course they are going to take up when they enter the agricultural college afterwards.

11548. If they take science subjects at a school of your description before going on to an agricultural college, which subjects would you prepare them in?—Chemistry, physics and some biology.

11549. The great majority of your boys would not proceed, and you do not intend them to proceed, to an agricultural college?—That is so, and I would really rather that they—that is, the majority—did not proceed. I pretend to train farmers, and I think that I do train farmers. The course is not sufficiently advanced for training lecturers.

11550. So that when Mr. Medd used the term "intermediate school" you did not in your answer to him mean that your school was an intermediate school between the elementary school and the college?—No. Of course, in a scheme such as Mr. Medd was suggesting, that is the position we should occupy; if we train and send boys on to college we should be an intermediate school.

11551. Yes, but that position in such a scheme as Mr. Medd suggested is not the particular object for which your school exists?—No; our school is mainly for tenant farmers' sons; and the great majority of the boys are tenant farmers' sons, and I have any amount of evidence from the boys of the great value they have found in the instruction afterwards. I consider there is no subject that is of greater value in a school in teaching than the subject of agriculture, apart from its utilitarian value. I am of opinion that it is a very wide subject and one which,

when properly handled, has great educational value in training boys in habits of observation and thought. I think that the establishment of a museum, for example, is in itself a most excellent thing; we have established a museum at Dauntsey since I have been there, and it has been of great educational value both to the staff and the boys.

11552. The Chairman asked you why you should set up a type of schools specially for the agricultural industry and not for the other industries. I do not know that I should suggest an answer, but from what you have said to me now it appears to me that your answer would be this, that the sons of agriculturists have to go to school in any case, and that, therefore, you should provide them with this type of school rather than with the ordinary grammar school?—Yes, that is just what I mean, and if such schools were provided for them, I think—of course, I speak from the

experience that I have had down there, and from what many of the boys who have left have told me of the substantial benefit they have derived from the training they had with me—it would be an excellent thing for them.

11553. You would justify the expenditure not on technical grounds but on educational grounds?—On educational grounds; I consider agriculture to be a highly educational subject.

11554. (*By Lord Barnard.*) Mr. Latham would like to know on what grounds you put down here that you get assistance from other County Councils besides Wiltshire?—We have had scholarships from other counties besides Wiltshire in the past.

11555. A scholarship is meant to be of assistance to the scholar and not to the school, is it not? Have you ever had any grants?—I believe not.

Mr. F. O.
Solomon.

26 June, 1907

TWENTY-THIRD DAY.

Thursday, 27th June, 1907.

PRESENT:

The Lord BARNARD (*in the Chair*).

The Lord BELPER.
Lord MORETON.
Mr. THOMAS LATHAM.
Mr. DAVID DAVIES, M.P.

Mr. J. C. MEDD.
Professor T. H. MIDDLETON, M.A., M.Sc.
Mr. A. E. BROOKE-HUNT (*Secretary*).
Mr. H. L. FRENCH (*Assistant Secretary*).

Miss WILKINSON, Principal of the Horticultural College, Swanley, called and examined.

11556. (*By Lord Barnard.*) Please tell the Committee in what capacity you attend?—I am Principal of the Horticultural College at Swanley.

11557. Is that a voluntary college—I mean neither a Government nor a local authority institution?—That is so. We get a grant from the Board of Education, but the institution is mainly carried on by the fees of the students.

11558. Kindly explain how your College originated?—It was started in 1889 by a few persons as a limited liability company.

11559. For what purpose?—For men.

11560. But to do what?—For the purpose of teaching them gardening and general horticulture, fruit growing, etc. Women were first admitted in 1892—and in that year the institution was incorporated by license of the Board of Trade, so as to enable us to receive grants from the County Council. The license limited the payment of dividends.

11561. I suppose you are a non-profit company, with no power, or a limited power, to divide profits?—That is so. I think we can pay 5 per cent. dividend, but not more.

(*By Mr. Medd.*) It is the same as the Girls' Public Day School Company, which is limited to 5 per cent. I think the same rule applies here.

11562. (*By Lord Barnard.*) It would be interesting to the Committee to learn the reasons why the change was made from men to women students?—When women were first admitted there were only a few who attended, but afterwards there was an influx of them, and their number gradually increased until we had about fifty women students and only ten men students: it was then considered scarcely worth while to keep the men, as they could get their training elsewhere.

11563. That was a natural evolution, as the institution developed itself?—Yes.

11564. Where do the women reside?—Some reside at the College, some at South Bank, or at boarding houses started for their accommodation. A few go to the Colonial Branch in the village.

11565. Is that a separate building?—Yes. A few of the students over 25 years of age live in the village.

11566. I suppose the constitution of the governing body is regulated by the Articles of Association?—Yes.

11567. What does the governing body consist of?—It consists of persons elected by the members of the College and representatives of public bodies who give us a grant of over £50 a year, and there are six honorary members.

11568. Are there members co-opted by the governing body?—They are elected by the general body at the annual meeting in March.

11569. How often does the governing body meet?—Once a month—except in August and September.

11570. Is there a clerk or secretary?—I act as secretary at the meetings of the governing body, but we have also a secretary at the College.

11571. Do you send reports of your proceedings to the County Council?—No, because that body does not give us any grants. We do, however, as I have stated, get a grant from the Board of Education.

11572. What are the courses at the College?—There is a diploma course and a practical certificate course.

11573. How long do these last?—They both last two years.

11574. What is the difference between the two?—Those

Miss
Wilkinson.

27 June, 1907

Miss
Wilkinson.
—
27 June, 1907
—

entering for the certificate course have to pass the Royal Horticultural Society's examination, the College examination in practical work, and do practical work for two years. In the case of the diploma course the students have, in addition to the above examinations and work, to pass the examination of the Board of Education for botany and rural economy, and they also have to take two of the following subjects: dairy work, poultry or bee-keeping.

11575. The diploma course is the higher one?—Yes. The certificate course is more for the ordinary practical gardener.

11576. With regard to the diploma course, what is it intended to fit the women for?—It gives more experience and more general knowledge, and many of the students take it with the idea of themselves becoming teachers.

11577. Is there any research work?—Several have gone into research work after leaving us.

11578. Are the women who get the diploma qualified for research work?—Not without further training, but after the end of the two years a student has made up her mind whether she wishes to do it. Some of our students have taken scholarships for the Royal College of Science.

11579. The certificate course is more intended to fit women for practical work?—Yes.

11580. Either for employers or on their account?—Yes.

11581. Have you a natural history course?—We hope to start that in the autumn—in September, 1907. We hope it will fit our students for taking posts in girls' secondary schools where there are openings for botany and gardening.

11582. (*By Mr. Medd.*) Is there not a "nature study course" for teachers which is already recognised by the Board of Education?—Yes, during August.

11583. (*By Lord Barnard.*) Have you often been asked whether you can suggest or recommend students qualified to be teachers?—We have been repeatedly asked by secondary schools, but we have been unable to recommend any sufficiently well qualified. We had an application the other day from a large school in Berkshire, but we had no one ready who was well enough qualified.

11584. Then there is a demand?—Yes. I could have placed five last year if we had had them fully qualified, and this year we have had one application.

11585. If you had increased facilities do you think you could supply that demand?—Yes. I have seen many headmistresses who have told me that there is a demand for a student who has taken the natural history course.

11586. You have some courses for elementary school teachers?—Not specially for them. The "nature study course" is for both secondary and elementary school teachers.

11587. Do you find that course well supported?—Yes, very well. In the first year we had 55, in the second 43, and last year 53.

11588. Do these students live at the College?—Wherever we can place them. This year we expect to have 60, and I suppose every available bed in the village will be occupied.

11589. Do they come in the vacation?—Yes, for a fortnight.

11590. Do they come only in the vacation?—We have short courses for six or seven weeks during the summer term in gardening, bee-keeping, fruit-preserving, dairying, and poultry-keeping. We have students at almost every part of the year. With a view to the training of teachers a course of natural history for third year students or teachers from other colleges or schools has been planned and will begin in September next. The short courses come in May, June and July, and the "nature study course" at the beginning of August.

11591. Then your staff cannot have much holiday?—They do not. Holidays are very difficult to arrange.

11592. Do students come at any time for special objects?—Generally, I think, to work in their own gardens, either in the open or under glass, for fruit growing, dairying, poultry-keeping, and bee-keeping.

11593. I mean do students ever come with a desire to inform themselves particularly with regard to the cultivation of some special product or crop?—Yes; some come with a special desire to learn about fruit growing. We have three now engaged in this study out of doors, and sometimes they specialise in work under glass. If the students come for the two years' course we advise them to take the general course first and then to specialise the last year.

11594. What does the college course include?—The subjects are practical and theoretical horticulture, botany, agricultural science and rural economy, entomology, book-keeping, green-house construction, bee-keeping, dairying, poultry, manual training and fruit preserving.

11595. What are the fees?—They are as follows:—

Full Course. For bed sitting-room from £96 to £120 per annum.

For cubicle bedroom from £80 to £89 per annum.

For tuition only .. £40

Extras. Dairy £3 3 0

Poultry-keeping £3 3 0

Bee-keeping £2 2 0

Natural History Course. For bed sitting-room from £96 per annum.

For cubicle bedroom .. £80 per annum.

For tuition only .. £35 ..

Short Courses—6 weeks. Bed sitting-room £16 16 0

Cubicle £13 13 0

11596. How many students have passed through the College?—410 women students in the years from September, 1892–1906. The average number from 1902 to 1906 was 74, and the present number is 70.

11597. Does that include students who come for two weeks?—Yes, but we have very few who come for so short a time; five weeks is more usually the shortest time.

11598. From what classes are the students drawn?—They are drawn from all classes. Of the present students, the fathers of 28 are professional men; 15 gentlemen; 18 are in business; 4 farmers; 1 merchant service, &c.

11599. What is the general age of the students?—They are over 17 years of age. At one time we took them at 16, but we found that rather young, and unless under special circumstances, we do not now take them so young, but we have them at all ages beyond that, and some over 60.

11600. What is the usual age?—I should say from 18 to 28.

11601. Young women in fact?—Yes.

11602. Have they been to secondary schools?—Yes, most of them.

11603. (*By Mr. Latham.*) I notice that you appear to have very few farmers' daughters?—We have only 4 of them now.

11604. Is that about the usual number?—We have always 3 or 4.

11605. And not often more?—Usually not more.

11606. (*By Lord Barnard.*) Can you furnish any particulars as to the after careers of students?—Yes. As follows:—

Landscape Gardeners	3
Market "	25
Head "	26
Under "	13
Working in Home Garden	49
"Jobbing" Gardeners	9
Teaching	23
Working at Science	5
Poultry-keeping	2
Manageress Milk Depot	1
Principals in Gardening Schools	2
Apiarist	1
At Royal Botanic Gardens, Glasnevin	2

161

Present Students 70

Living at home, not gardening, and dead .. 117

Lost sight of 62

Total .. 410

11607. Have you any further observation as to future careers and openings for students?—I think the students are best fitted to be head gardeners or garden mistresses in girls' secondary schools where the pupils take a gardening course, or as jobbing gardeners, but some become market gardeners and there are a few such who seem to do well.

11608. With regard to the 161 students mentioned in your table as working on their own account, are they married women?—Some of them are married women. Married women often give up the work with the idea of perhaps taking it up afterwards if necessary. Nevertheless, I think it is a good thing that they have had the training even if they do give up gardening for a time.

11609. Do you think that the bulk of your women students intend to earn their own livelihood, to qualify themselves for doing so, or do they desire to acquire knowledge that would be useful to them as married women?—That is a difficult question. Some who leave us go to take up posts and others go to live at home and to manage their own or their fathers' gardens.

11610. Do you know of any married women to whom the College course has been useful?—Yes; for instance I could mention one whose husband was a schoolmaster, but he had to give up that work on account of loss of hearing. He took to market gardening work and his wife came to the College in order to learn how she could best help him in that work. There is another student who married a Kew man and they are now in the West Indies, where she is helping her husband in gardening work.

11611. Should the Committee be right in saying that your College is useful to women whether they marry or not?—Yes; in many cases the women are able to help their husbands.

11612. I understand you have a list of the best openings for fully trained students on leaving?—Yes; it is as follows:—

- (1) Teachers of nature study and lecturers on horticulture under County Councils and
In training colleges and girls' secondary schools.
- (2) Inspectors or supervisors of school gardens in county elementary schools.
- (3) Head gardeners or garden mistresses in girls' secondary schools where the pupils take a gardening course;
Head gardeners in private places;
Head gardeners in institutions.
- (4) Market gardeners.
- (5) Jobbing gardeners.
- (6) Workers in their own or their parents' gardens.
- (7) Gardeners or fruit growers in the Colonies.

11613. Are there many openings for your students as head gardeners at private places?—Yes, we have now about 26 employed as head gardeners at private places. One of them is with Mrs. George Cadbury at Birmingham and has been head gardener there for ten years.

11614. Is it your opinion that the hard work of a head gardener is suitable for women?—The head gardener need not have hard work. It is the under-gardeners who do the harder and rougher work.

11615. (*By Mr. Latham.*) If the head gardener does not work what does he or she do?—The head gardener works, but does not do the hard work such as digging, etc. At Mrs. Cadbury's there are several men employed as assistant gardeners.

11616. (*By Lord Moreton.*) I suppose you would say that the head gardener does not do such work as a man would do for two shillings a day?—Quite so. The head gardener may work in the sense of showing assistants how to work, but I don't think that in the best kept places the head gardeners do much hard work. They may do the pruning of the trees and organising and arranging.

11617. (*By Lord Barnard.*) Then the result is that you think the work is not unsuitable for women?—No, not in the case of suitable women. Some of them may have to act as under-gardeners for a short time in order to gain experience.

11618. Would the same remark apply to those who are market gardeners?—The market gardeners do a good deal of the work themselves and it makes a good deal of difference whether a woman is working for herself or for someone else. It is more interesting if she works for herself, and she can arrange her own time for working.

11619. Are they doing well at market gardening?—Several of them seem to be doing well.

11620. From certain evidence given before us it seemed to be rather doubtful whether upon strict commercial lines—on the basis of the accounts being submitted to a professional accountant—market gardening could be made to pay, but I suppose most of your students have some private means?—Very little; only just enough to start their market gardens. They must in such cases have a certain amount, but they keep themselves by their gardening. I know two or three who are doing very well, and four more set up last year, but it is still rather early to judge whether they are likely to succeed. I know several who are setting up as fruit-growers.

11621. What do the jobbing gardeners get?—Wages

ranging from 4s. to 7s. 6d. a day, and they have rather shorter hours than the men.

11622. (*By Mr. Latham.*) Are they actual labourers?—Yes; in one case at Hampstead a jobbing gardener has two other women working with her and a boy. They have a good connection and are doing well.

11623. Do you send some to the Colonies?—Yes. We have sent about 15 to the Colonies.

11624. (*By Lord Barnard.*) I suppose that in many of the Colonies there are openings for fruit-growing?—Yes, in Canada, South Africa, and the West Indies. One of our students has gone to Quebec as head gardener in a large place.

11625. In short, you consider that the college courses fit women for Colonial work?—Yes, I think so.

11626. Have you a large staff?—We don't think we have too many. The staff consists of the following:—

Lecturers and Instructors:

Bee Keeping	1
Book Keeping	1
Botany Lecturer	1
Botany Demonstrator	1
Dairy	1
Entomology	1
Gardening Lecturer	1
Greenhouse Construction	1
Horticultural Science	1
Chemistry	2
Manual Training	1
Poultry	1

Garden Staff:

Head	1
Foremen	3*
Demonstrators	4†
and	
The Principal	1
Vice-Principal and Secretary	1

* 1 of these is a woman.

† 3 year students.

11627. Do they live on the premises?—Most of them live on the premises. Several, however, are visiting lecturers. The botany lecturer has a cottage in the grounds and the head gardener has another.

11628. Have you any difficulty in keeping your teachers?—No. The botany lecturer has been with us, I think, eight years; the head gardener for six years, and the lecturer on horticultural science since the college began.

11629. Do you consider your staff well paid?—I think we ought to give higher salaries, but unfortunately we cannot afford it.

11630. Are the members of the staff mostly women?—The women are:—the botany demonstrator, the dairy teacher, the gardening lecturer, the poultry teacher, and the forewoman and three demonstrators.

11631. Are the others all men?—Yes.

11632. What about the equipment of the College?—The equipment of the College so far as accommodation for teaching purposes is concerned is inadequate in many respects. It is as follows:—

Large lecture hall for 70.	
Small lecture hall for 18.	
Biological laboratory for 30.	
Chemical laboratory for 12.	
Large conservatory, stove intermediate, propagating and cool houses put up in 1900.	
14 Market houses each 100 ft. long.	
3 Smaller houses and frames.	
2 Potting sheds	
1 Garden office.	
1 Mushroom house.	
1 Carpenter's shop.	
1 Store.	
Dairy.	
1 Jam shed.	
Poultry runs.	

The grounds consist of 43 acres of land divided as follows:—

2 Fruit plantations	25 acres.
Grass land	9 "
Flower garden	2 "
Vegetable garden	5 "
Land covered by buildings, glass houses and frame yard	2 "

Miss
Wilkinson.

27 June, 1907
—

Miss
Wilkinson.
—
27 June, 1907
—

11633. (*By Mr. Latham.*) What do the 25 acres consist of?—I do not think I can tell you off-hand the exact measurements but I can tell you the purpose to which we apply these two fruit plantations, namely, the growing of apples, pears, plums, bush fruit, etc.

11634. Do you grow many gooseberries?—Yes, and vegetables. We have just taken down about 3 acres of oak spinney which we are going to plant with fruit trees in the autumn.

11635. (*By Lord Barnard.*) Certain County Council scholars are allowed to hold scholarships at your College?—Yes.

11636. How many have you now?—None at present.

11637. Do you approve of that system of County Councils sending their scholars to you?—Yes, they have included some good students, but I think it is a mistake to make the County Council examination, and especially the London one, so stiff; as when girls have passed it they often do not care to come to the College, and others who might make good students but who are not good at book work are unable to obtain the assistance they require to enter as students.

11638. When a scholarship is given, does it cover all the expenses generally?—Not in every case; in some cases the student has to make up £15 or £20 herself, and I think it is generally a very good thing that they have to do so, because a student works much better if she is responsible for some of the fees herself.

11639. You have a system of corresponding members at the College?—Yes.

11640. Would you tell us what those corresponding members are; I suppose they have not any pecuniary interest in it?—No, they are simply people who take an interest in horticultural education, and when we send them any of these papers they are able to give information about the College.

11641. You have furnished the Committee with some of those papers?—Yes.

11642. On the whole you consider the work of the College has been satisfactory?—I think very satisfactory, and I think all those who go down and see much of the life down there feel that it has done a very good work. The girls are very interested in their work, and it makes them strong and healthy.

11643. I suppose you do not consider that finality has been reached?—No.

11644. Can you tell us in what way you think the College could be improved?—Of course the fees barely pay for expenses; we consider the fees do cover the working expenses, but there is no margin left for improvements, and there are a great many improvements that we should like to make.

11645. Do you think that you ought to receive a grant from the central Government?—I think we ought to have something to improve the equipment of our College.

11646. Do you think the State ought to assist in providing that?—We do.

11647. (*By Mr. Medd.*) We are anxious, are we not, for aid from the Board of Agriculture if we can get it?—Yes, for the equipment of the College.

11648. Especially for the improvement of the equipment?—Yes.

11649. (*By Lord Moreton.*) An annual grant?—Yes, an annual grant.

11650. (*By Lord Barnard.*) On the ground, I suppose, that you are doing a good national work?—Yes, and work that is really wanted, and which improves the education and physique of our women.

11651. You have, of course, considered as the corollary of national aid a certain amount of national control?—Yes; we have that already from the Board of Education, and we find that of great assistance to us. The inspectors have taken keen interest in the work, and they have been of the greatest help to us in coming down and advising.

11652. You would not mind the College being treated, if it received national assistance as part of a national system, that is to say, that the work should be co-ordinated with similar work done elsewhere?—If we are not required to launch out into too great expense in order to gain a grant.

11653. It strikes me that your present system of corresponding members is already a commencement of what I mean, that is, that other districts should have an oppor-

tunity of knowing what is being done in your College, and of knowing the advantages that you can offer?—Yes.

11654. And that you should know what is being done elsewhere?—Yes; I always endeavour to find out what is being done elsewhere.

11655. Some suggestion has been made that there should be a consultative committee established in London. Do you think your Governors would be prepared to take part in such a central body?—I have no doubt they would.

11656. So that a national work could be run on national lines?—Yes.

11657. I do not wish you to infer that I am suggesting that your work should be interfered with?—I think we should be willing to do that—of course I cannot say definitely, but I am sure from what I know of the feeling of the governing body that they would welcome it.

11658. Do any of your students continue their education at University Colleges or Universities?—We have got one who is now at the Royal College of Science; she went on last year from us; she got a national scholarship in biology.

11659. Who keeps the accounts of the College?—Miss Kekewich, the Secretary, is responsible for them, she has a book-keeper under her.

11660. A paid book-keeper?—We have a student who is not able to pay her full fees; she was book-keeper at the *Illustrated London News* office for a number of years, and she is working out part of her fees by keeping our books. We have them audited every year. You were asking if any of our students are continuing any of their scientific studies. Miss Brenchley is working with Mr. Hall at Rothamsted and is doing exceedingly good work, and Mr. Hall is very anxious to keep her on as an assistant.

11661. It seems to me that laboratory work is work that a perfectly qualified woman might very well undertake?—Yes, and Miss Brenchley speaks of the great advantage the College course has been to her, and says that the knowledge she obtained at Swanley has been exceedingly useful.

11662. (*By Professor Middleton.*) Does the number, 410 women students, include those who have taken the "nature study course"?—No.

11663. You draw students from all parts of Great Britain?—Yes.

11664. I see you have only one correspondent in Scotland; do you have many Scotch students?—We have a few.

11665. You have several correspondents in Ireland; does that mean that you have more Irish students?—I think on the whole we have had more Irish students than Scotch.

11666. In a general way from what districts do your students come mostly?—I suppose from the home counties?—Ten from London, eight from Middlesex, six from Kent, five from Hampshire, three each from Somerset and Suffolk, four from Sussex, three from Yorkshire, three from Scotland, and as to the rest there is about one from each county.

11667. (*By Mr. Medd.*) The meetings of the governing body are held every month, are they not?—Yes.

11668. There is a permanent secretary, is there not, Miss Kekewich?—Yes, she is vice-principal and secretary.

11669. You were mentioning a lady who has gone to Quebec?—Yes.

11670. Could you tell us what she does there?—She is head gardener to one of the leading men in Montreal; she looks after the whole of the garden and helps with the organisation. She is only there six months in the year, as no out-door gardening can be done in winter in that part, and at present he has no glass. She lives with the family, and has a very delightful post in every way.

11671. Do any of your students come from abroad?—Some come from abroad; we generally have three or four foreigners.

11672. One Dutch baroness was a particularly good student, was she not?—Yes; she was with us for three years, and was very much interested in the work.

11673. I think she passed first in England?—She passed first-class in all her examinations.

11674. With the present number of students the fees are about adequate, are they not?—Yes.

11675. If we drop eight or ten it means a loss?—If we keep the numbers at 50 we can run without a loss; if we go below 50 we shall run at a loss. I do not know if you would be interested to hear that a student from the College,

Miss G. Sherris, has gained the gold medal of the Royal Horticultural Society, being bracketed with a student from Studley College. This is the ninth time in thirteen years a College student has obtained this distinction.

11676. (*By Lord Barnard.*) May I express on behalf of the Committee the appreciation of the way in which you have prepared your *précis*? It has been very useful to us. The Committee would also like to express their approval, if they may do so, of the way in which the

accounts are drawn; they seem to be admirably prepared, and show the position of the Institution at a glance. —I am very pleased you have appreciated it. May I say that I do not think anyone who has not stayed at the College can appreciate the amount of voluntary work that has been done since 1892. Nearly everyone who comes down gets greatly interested in the College and in the students, and help us very much indeed. The chief reason that we keep Miss Kekewich is because of her great interest in the work and the students.

Miss
Wilkinson.
—
27 June, 1907
—

Mrs. HOPKINSON, called and examined.

11677. (*By Lord Barnard.*) You are the Chairman of the Colonial Branch of the Horticultural College, Swanley?—Yes.

11678. Would you tell the Committee when that Branch of the College was established?—It was established in 1902, at the request of Miss Wilkinson, when we changed the College. We changed the College from a men's college, including women students, to a college for women only, and we thought it would be a very good thing to bring in domestic science and to form a branch in which to train girls, who would have an especially suitable training to go out to the colonies and take up posts there. We mutually agreed about it.

11679. The actual establishment of the department was carried out by the governing body?—It was carried out by me in the first instance, and then it was brought to the notice of the governing body, who took the official steps. Sir John Cockburn, who is now chairman of the College, joined the committee of the Colonial Branch immediately. It was a joint thing.

11680. It still remains part of the College?—Entirely—much more so than it was at the beginning. We publish our report in the same cover as the College report.

11681. Are the students trained in a different place—are they trained in the College itself?—They go to the College for the main part of their training; it is only the domestic part they take in the Colonial Branch, and a certain amount of elementary gardening in a garden attached to the Colonial Branch Home, but the gardening is taught principally at the College.

11682. The students of your department live in a separate boarding house?—They do at present.

11683. How many students have you?—There are usually about 12 in residence.

11684. Have you accommodation for more?—No, it is quite small; it is just an initial thing. I do not live there; I just take an interest outside in it. Miss Kekewich and Miss Wilkinson manage it, but I started it, and I took a great interest in it at the commencement, and I take a very warm interest in it now outside.

11685. The subjects you teach are set out in your *précis*?—Yes.

11686. I see they include cooking, domestic economy, hygiene and poultry-keeping are taught, and simple cottage gardening in the acre of ground attached to the house?—Yes.

11687. The students are also taught practical and theoretical gardening, elementary botany, agricultural chemistry, fruit preserving, dairying, poultry-keeping, bee-keeping, and manual training?—Yes.

11688. How long is the course?—The course is supposed to be for one year, but it generally is extended.

11689. The course in your department is very much the same as the first year course at the College?—Yes; some of the first year College course is omitted, and also such work as is considered of little value in the Colonies. The students are especially encouraged in fruit growing and preserving, dairying, poultry-keeping, and bee-keeping; there is also a certain amount of nursing taught by nurses, who come over from Parkstone Convalescent Home to teach elementary hygiene and other matters that are likely to be useful to girls in Colonial life.

11690. There is a minus—you omit a certain part of the theoretical part of the instruction that is given at the College?—We do.

11691. How is your department financed?—In the first instance friends and I joined together and financed it for

three years; we had the fees coming in, but the supplementary money was provided by us.

11692. Those were donations, I suppose?—Donations and subscriptions and so on. There is a little balance sheet here to show the initial stages of it. It was a comparatively small amount that was needed, but still it carried it on for three years; we said we would carry it on for three years, but that after three years it must run on its own account, otherwise it would prove that it was not wanted.

11693. You got some money from a trust, I think?—Yes, the Bawden Trust allocated £1,000 two years ago to the Colonial Branch—the income to be paid to the Colonial Branch.

11694. Do you know the terms of that Trust?—Not all; it is called the Bawden Trust; it supports a great number of educational things.

11695. You cannot have gathered very great experience as yet, as the institution has only been at work a short time?—No.

11696. But so far as the result of your experience goes, has the training that has been given been appreciated?—I think very much so, especially in Canada, where the domestic part was so much wanted. South Africa was the field that attracted me, and we are just beginning there. Sir Hamilton Goold Adams went down to Swanley with me last autumn, and was so very much pleased with what he saw that he has engaged a student to go out to be a teacher of gardening at Bloemfontein, on the staff there. This lady was not quite ready at the time and required a little more experience, but she is sailing next week to take up that important position.

11697. In future you anticipate being able to supply the Colonies with students from your Branch?—Yes. I do not know whether the letters dictated by Sir Hamilton Goold Adams would be of interest to you, if so I can spare you copies of them. Those are the original letters, and you will see how he speaks of our work. (*Handing documents.*)

11698. Your department is under the superintendence of an advisory council, consisting of a number of ladies and gentlemen who are all very well known?—Yes.

11699. The actual management is committed, I suppose, to an executive committee, of which you are chairman?—That is so.

11700. How often does that committee meet?—About once in two or three months, just as it seems needed.

11701. Miss Kekewich and Miss Wilkinson do the detail?—Yes, they are on the spot and they do the detail.

11702. How many students have you passed through this Branch up to the present?—Sixty-five. I have a *précis* here of what they have taken up and of what they have done.

11703. I see from the *précis* you have put in that although a good number of them have gone to the Colonies there are some who have not done so?—Yes.

11704. Do you know whether they intend to go?—Some of them undoubtedly do, but some have taken the course, only because it is a little cheaper than the course at the College, and we fill in so as not to keep the place empty with the overflow from the College.

11705. In addition to the training you give them being especially suitable for the Colonies, you consider it is also suitable for home life in England?—It is.

11706. (*By Mr. Latham.*) On the top of page 4 you say :

Mrs. Hopkins. "Miss May has just been engaged as bailiff on an estate in Suffolk" ?—Yes.

27 June, 1907

11707. Would you kindly explain to us what that means ?—She has taken a good position on an estate there. She was going out to the Colonies, but there were no openings just at the time—there was rather a dearth of posts—and she was obliged to take up work immediately, and she has taken an engagement as bailiff on an estate in Suffolk—I do not know whether she will go out to the Colonies now or not.

11708. (*By Lord Barnard.*) Twenty-two students, you state, have already gone to the Colonies ?—Yes, and I have set out what they are doing. Miss Mary Hewetson was a most promising student. After being eighteen months head gardener in Natal she took up an allotment of her own of 60 acres in Natal and was working splendidly on it, and it was expected by the Natal Government that the work she was doing would be of great value to the Colony, but we regret to record that she died three months after she took up that work. She wrote an extremely valuable report on the openings for women in fruit growing in the Colony, which was published, and of which I put in a copy.

11709. With regard to those of the students who have married, are you aware whether the training that they had has been equally useful to them ?—Yes; for instance, Mrs. Kelly, who was Miss Millar, has done extremely well. She married in the Orange River Colony, and had a dairy and poultry farm. She has written records of the excellence of the training she had; we have had extremely interesting letters from her, proving the value of the training.

11710. In addition to those who have gone to the Colonies, nine more are arranging to go ?—That is so.

11711. You have heard Miss Wilkinson's evidence ?—Yes.

11712. Are your students drawn from the same class ?—They are much the same; usually the daughters of professional men, naval and military officers, farmers and landowners.

11713. The fees are slightly less ?—Yes.

11714. They are £70 a year, or 25s. a week ?—Yes.

11715. As to the openings for women trained in your course, you give a list ?—Yes.

11716. Superintendents of gardens with native labour, head gardeners; settlers of land specially suitable for skilled work on fruit plantations or fruit farms; managers of dairies; managers of poultry; managers of bee farms; matrons of schools or institutions, and "helps" in Canada particularly ?—That is so.

11717. I should like to know how you have drawn up that list.—How did you arrive at it ?—It is drawn up mainly from this synopsis of the students; they have particulars at the College of all of them as they have gone out.

11718. Are you in communication with any organisation in the Colonies ?—We are in communication with nearly all the governments of South Africa now.

11719. You get advice from them, and so on ?—Yes, very much so, and also from Canada we get a good deal of advice. I am on the committee of the South African Colonisation Society, and we get advice from that source, too.

11720. With regard to the question Mr. Latham asked you, will you tell us the way in which Miss May acts as a bailiff on this estate in Suffolk ?—A gentleman has bought a large estate there, and hearing that she was fully trained, especially in agriculture, first at the College and then on a farm at Swanley, he has engaged her as his bailiff. Of course, it was intended that she was to go out to the Colonies, but at that time there were no openings at all, and she has had to earn her living in England.

11721. Is she English-born ?—She is; she is the daughter of a naval man in the merchant service. She has only just taken the post up; she had been working on a farm at Swanley for some time before she took up this post.

11722. A great part of the farmer's business—correct me if I am wrong—consists in the marketing of his produce ?—Yes.

11723. Is a woman such as you have named qualified for doing that kind of work ?—I think she was qualified for everything connected with agriculture, marketing, and so on. Miss Wilkinson will tell you that this lady has lived in a farm house with the farmer's family, and gone to market and done exactly the same work as men.

(*Miss Wilkinson.*) Yes. I should think she is quite unique. She has lived in the farmer's house and has done everything, and gone about just as a man would. She has now gone to a place somewhere near Beccles, but she has been carrying on that work at Swanley for the past two or three years.

11724. (*By Mr. Latham.*) I suppose we may not take it that your ladies who are taught at this College are eligible to take up positions as farm bailiffs ?

(*Miss Wilkinson.*) This one is; I do not think the others are.

(*The Witness.*) It is quite an exceptional case. We very much hoped that she would have gone to South Africa, but there was a great dearth of paying posts at that time, so she did not go.

11725. (*By Lord Barnard.*) Do you consider it desirable that this branch of the work should be extended ?—I think at present it is about the size it should be, but we want certain improvements, in order to make the work more valuable.

11726. Improved buildings, do you mean ?—A colonial house of moderate size, built to suit the requirements which have been found essential to this work, and built close to the College buildings on an available piece of ground, would add enormously to the value and scope of the work, but funds are lacking. Failing this, more small things are required—Miss Wilkinson brings it out more especially—laundry apparatus, text books, and matters of that kind.

11727. As you form part of the original institution practically, may we take it that what Miss Wilkinson has told the Committee includes your department ?—In a large measure, but we should like some special things for this purpose.

11728. (*By Lord Belper.*) Is your Branch of the College entirely independent in its financial arrangements of Swanley College ?—It depends on its own fees, the fees paid by the girls who live in the home; it is independent of the College in that sense, but it is dependent upon it in another sense—that it could not exist without the College.

11729. Are the financial arrangements quite separate from those of the College ?—Quite separate.

11730. You depend, therefore, upon your own fees for supporting this Colonial Branch ?—We do.

11731. Do you get any grants besides the donations that you have mentioned ?—Not except the Bawden Trust, which has been mentioned just now.

11732. You get no grants from the County Council, for instance ?—No. We have had one or two from the City Companies—two, I think—the Clothworkers' and the Skinners'. The Skinners' grant went to the College itself towards improvements helpful to the Colonial Branch; the Clothworkers' to Colonial scholarships.

11733. That is, the Colonial Branch ?—To the Colonial Branch specifically, the Clothworkers' grant.

11734. Your funds are mostly found by voluntary subscriptions. Are they sufficient to carry on the work ?—Now there is a sufficient income to carry on the work; just enough. It simply balances; there is nothing for extensions.

11735. How many students can pass through your Branch together ?—They pass through at different times, in different numbers, because some, perhaps, only take six weeks' domestic course.

11736. Some take short courses and some longer courses ?—Yes.

11737. How many can you deal with at once ?—About 12 can be dealt with in the house at once, but, of course, they pass very rapidly through. There may be a good many in the year, but some only for short courses.

11738. What is your shortest course ?—Six weeks. They learn some cooking at the Colonial Branch, and they go to the College for cheese making, etc., and some of these young married women have written from farms to say that the soft-cheese making they learnt has been invaluable to them and has brought in money at once.

11739. From what class do your students come ?—They are usually the daughters of professional men, naval and military officers, farmers, and landowners—those are the classes.

11740. You take them from all over England ?—We do, and Ireland and Scotland—all over.

11741. Except with regard to the scholarships there is

no local connection; it is not supported in any way by the county, which would enable them to send a certain number of students to your department?—Not at present.

11742. You get no grant from the Board of Agriculture?—No, not specifically.

11743. Does the College get a grant?

(Miss Wilkinson.) We get a grant from the Board of Education.

11744. Not from the Kent County Council?

(Miss Wilkinson.) No.

11745. Practically your Branch of the Swanley College is mainly for giving instruction which may be useful to ladies going out to the Colonies?—That is so.

11746. You do not make it a *sine qua non* that they should be going to the Colonies, do you?—Now we do, especially if they take a scholarship. We always get them to sign a paper which binds them to do so—that they must go out if they take the help we give them.

11747. There are a considerable numbers who do not go?—A certain number; but unfortunately we could not avoid that at the start.

11748. Now you are so satisfied with the excellence of the work, and of the advantage that it is to the Colonies, that you confine your efforts to that?—Yes, in large measure.

11749. I suppose the land on which the students work is at the College itself?—Yes, but they have a little acre-garden, which they manage entirely. They supply the house from it; the students themselves supply the house with the vegetables, and it gives them, so to speak, a little Colonial experience both in poultry keeping, bees, and in vegetables and fruits. They supply the little household with those things, and they cook their own meals, and do all that would need to be done on a small Colonial homestead with a small plot of land attached to it; of course, as near as our experience can teach them.

11750. Do you find there are a considerable number of students who want to come to you?—It varies rather; sometimes there is quite an influx, and we cannot take them, and then again there are not many. It depends very much on the openings there are in the Colonies. If South Africa opens up, as I believe it will, it will lead to an impulse here.

11751. You are not connected with any local educational

bodies who might sometimes find you students who were anxious to take up this sort of work to fit them for posts in the Colonies?—I do not think we can say we are immediately connected with any local body. I think the most immediate connection we have is with the South African Colonisation Society, which in a certain sense meets what you ask. I constantly have enquiries from them, and I have affiliated the Colonial Branch to them, and the President of the Society is satisfied it is a good thing to train the students in this way and to send them out.

11752. One would think a large County Council which had a grant for educational work, if they found there were ladies in their districts who wanted such special teaching, they might be very useful as feeders to you, and you might be very useful to them?—I think that is a very valuable suggestion. We will follow that up. We had not quite thought of that.

11753. Of course, to a large extent agriculture and horticultural education, so far as it is organised, is in the hands of the County Council?—Yes, but we are also affiliated to the British Women's Emigration Society, which manages emigration to Canada. Both those Societies are in close touch with us. They consider the Colonial Branch at Swanley as a training ground, and if there is a great want of these people there they turn to us. But your suggestion is very valuable, and I will pass it on to Miss Kekewich at once.

11754. You have no instruction for men?—No.

11755. It is for women only?—Yes.

11756. (By Mr. Davies.) Have you any Colonial people on your staff?—No; but we have a very strong advisory Council. All the Agents-General for the Colonies are on our advisory Council, and we can go at any time to them, and they will give us advice on any subject. Is that what you mean?

11757. Is it not rather difficult to fit these young ladies with an education to enable them to go out to the Colonies, unless the instructors know exactly from personal experience what sort of thing they will require to know when they get out there?—That is so. Of course, we have had to gather that experience, and anybody who could give lectures or addresses on these subjects whom we could get we have invited to come down to Swanley and give lectures on the subject. We have had a good many lectures given and addresses of that kind, and we have adapted our curriculum to suit those requirements thus set forth to a large extent.

Mr. JAMES MACDONALD, called and examined.

11758. (By Lord Barnard.) You are Secretary to the Highland and Agricultural Society of Scotland?—I am.

11759. I have no doubt you have looked at the terms of reference to this Committee?—Yes.

11760. So that you are fully acquainted with the object which we have in view?—I am.

11761. For how many years have you been Secretary of the Highland and Agricultural Society of Scotland?—Fifteen.

11762. That Society has in the past taken a very active part in promoting agricultural education?—That is so.

11763. Can you tell the Committee at all when the Society first took the matter up?—In 1856 it obtained a Royal Charter to give it special powers in connection with agricultural education, and in 1858 it began its annual examination.

11764. Prior to that time, and indeed subsequently, the Government of the country had really taken no part—I should like to use your own words as they exactly express my views—in directing and stimulating agricultural education?—None before and little or none for a long time afterwards.

11765. Practically your Society was the pioneer to a great extent of that work?—It focussed the movement that was rising through the country at the time and took the action which I have indicated.

11766. Of course the work which your Society did was of necessity of an initiatory and temporary character?—Yes, originally, although it continued a great deal longer than was expected.

11767. You are associated with the Royal Agricultural Society of England?—Yes.

11768. For how many years have you been associated with them?—For many years they worked side by side with us on similar lines but without any connecting link. As the growth of the educational institutions went on, the need for a central body was emphasised, and conferences were held which brought the two national societies into closer association in the work.

11769. The result I suppose you consider has been satisfactory in this way, that it has at last created a public opinion amongst agriculturists which has forced the Government, willingly I might say, of course, to take the matter up?—I think so; it brought out the need for agricultural education.

11770. It showed the need for it?—Yes, and I think it also demonstrated that agricultural education if they took it in hand in the right way could be promoted with great success.

11771. You of course know what has been done by the Government in the last 10 or 20 years?—I do.

11772. You think that the appointment of this Committee is a good omen, as it indicates a wish on the part of the Government to go still deeper and more closely into the question?—I am glad to say we look upon it in that light.

11773. Is it your view that under the circumstances the work of the societies may perhaps in the near future be modified or discontinued?—I should hope that the movement will be in that direction. I think the joining together of the two national societies was a step in the same line. Each Society was doing good in its way, but a stronger central influence was wanted, and it is hoped that we may now retire and let that stronger influence take our place.

Mrs.
Hopkinson.
27 June, 1907

Mr. J.
Macdonald.

Mr. J.
Macdonald.
27 June, 1907

11774. I think you are prepared to indicate to the Committee the considerations and main objects which influenced the Highland and Agricultural Society in taking the steps that led to the establishment of the National Diplomas?—These are just what I have already indicated. While the society was serving its local purposes fairly well it was felt that by itself the Society did not and could not possess sufficient national influence for the work that was ahead, and as it was found that the Government could not be induced to take action, it was thought that the two societies might join with some advantage.

11775. The results aimed at have been almost realised, have they?—The results originally aimed at have been very nearly attained and in much less time than I had anticipated.

11776. You have very carefully considered this question of the National Diploma and I understand that you would like to indicate the changes which are needed in your opinion in the system of granting the National Diploma?—First of all I would like to acknowledge that a change is likely to be needed. Agricultural education is making such rapid progress that I should think it would soon be impossible to draw all the students to one centre. In that sense alone, changes will have to be in contemplation.

11777. You are of opinion that the Council should define the subjects and periods of study qualifying for the diplomas?—Practically so.

11778. And that they should decide as to the teaching institutions to be recognised as entitled to prepare and enter candidates for the diplomas?—That is so; they should recognise colleges that are giving or are likely to give satisfactory courses of instruction.

11779. Do you consider the time has now arrived when the agency of central examinations might be superseded by other means?—I think a beginning should be made very soon in that direction. There are certain colleges that seem to me to have attained such a high position and whose examinations are so satisfactory, or so nearly satisfactory, that so far as these colleges are concerned, the necessity for an independent examination is very nearly gone.

11780. Do you think it would be a desirable thing if all these institutions were thrown together and organised on a national basis?—I do; indeed, I attach more importance to organisation on a national basis than to almost all the other details put together.

11781. So that the work done by one should be really a part of a national system?—That is so.

11782. On the subject of bulletins, I think most of these institutions now publish bulletins, or the results of experiments and so on?—I believe so.

11783. All that work you think might be guided by a central authority?—I do. I dare say I get copies of all these bulletins, and although they are very valuable, I think they would be still more valuable if the work were correlated and the results tabulated by a central body.

11784. You go a good deal about amongst farmers?—I do.

11785. Can you tell me the opinion amongst farmers as to agricultural education?—It is very surprising indeed the change that has come about in the opinions of farmers with regard to agricultural education.

11786. Are you satisfied in your own mind that the practical results have been advantageous to the working farmer?—They have been remarkably advantageous, considering the slender means that have been available for agricultural education. I do not mean to say that the instruction available on the more strictly practical side has been altogether satisfactory, but so far admirable work has been done, and it is to this that I attribute the rapid change in the mind of the farmer.

11787. Anything which would tend to disseminate the information which has been obtained by scientific men among farmers would be of value for practical purposes?—Certainly.

11788. I suppose you would agree with me, speaking for myself, and not for the Committee, that the work of training teachers and scientific men such as agricultural chemists and analysts, and so on, is of great importance as well as having in view the needs of the practical farmer?—Certainly. For the training of teachers there is need for fuller courses of study. I believe all educational institutions feel this want.

11789. I suppose it goes without saying that those en-

gaged in the agricultural industry cannot out of their own resources, in the present state of the industry, provide anything like adequate funds for such purposes?—I do not think there is any chance of the funds being forthcoming locally.

11790. The central and perhaps the local bodies are the only sources to which agriculturists can look?—I think so.

11791. You think they have a very strong case?—I do.

11792. You are, I understand, a Governor of the East of Scotland College?—I am.

11793. You can tell us what the Government do in Scotland for such colleges perhaps?—I have a very bad memory for figures, but I know the Scotch Education Department have been extremely liberal so far as the funds within their reach are available; I believe they have been even ingenious in their efforts to increase the funds. In Scotland they have been getting substantial grants not only out of money ear-marked by Parliament for agricultural education but also out of funds available for general technical education.

11794. Might I ask you whether these colleges and these grants come under the jurisdiction of the Scotch Education Department?—Yes, entirely now.

11795. I am told the grant which each college gets is at least £2,000 a year?—Something thereabout.

11796. The results are very satisfactory, are they not, in one way that you are educating a great many men, and turning them out?—Yes, the results are very satisfactory for the short time the colleges have been in existence.

11797. It is a fact that a great many Englishmen go to them?—A few have always been in the way of coming to Scotland and the number is not decreasing.

11798. It is a fact within my own knowledge that a great many Scotchmen come into England from those colleges, and they are very useful to us here?—Yes.

11799. They supply a demand very largely from those colleges?—Yes.

11800. Have you any suggestion as to the method of examination?—One suggestion I would like to submit is that greater consideration should be given to class records. In a central examination with students drawn away from their own colleges, it is difficult to obtain a proper knowledge of the class work of the students, and this we have all felt to be the main weakness associated with the National Diploma examination. I am bound to say that even at examinations in connection with teaching institutions this point is not receiving the attention that it deserves. I certainly would very gladly welcome any change which would make it possible in granting diplomas in agriculture to take cognisance of class work. In Edinburgh a good beginning has been made in that direction. All the three colleges in Scotland are now working quite on the National Diploma level alike in the instruction and in the examinations. The Edinburgh College has introduced into its Diploma examination this feature, to which I attach great importance, that records of the class work of the students throughout the whole year practically make up half of the marks on which the ultimate results are given. In view of that arrangement special care is taken during the year to keep records of the students' class work, and those are brought to the final examination. In the final examination there is a teacher and an outside examiner sitting together in all the leading subjects, and they not only have the student before them to be questioned, but they also see the records of his class work. I am bound to say the system is giving great satisfaction. At the time the National Diploma was instituted it was hardly possible to introduce any other form of examination than that adopted; but, happily, I think we could now depart from those lines with advantage, and as one of the pioneers of the National Diploma examination I would rejoice in such changes as would admit of fuller recognition of class work and class records.

11801. Some students are much more capable of passing written examinations than others?—There is no doubt about that. Many do much better in the class work than they do in the special examinations.

11802. What are your views as to the multiplicity of degrees and diplomas, and certificates which now exist?—I have taken some part in discussions on that question. I do not object to a moderate number of diplomas so long as they are thoroughly intelligible to the public and their value is well understood, but I do think it is confusing to the public and altogether hurtful to solid education to have a great variety of diplomas and degrees.

Mr. J.
Macdonald.
—
27 June, 1907
—

11803. At the same time anything like standardisation would be very difficult, would it not?—Yes, and on narrow lines it would be objectionable: I would not press for that at all.

11804. With regard to the practical training of these agricultural students would you agree with me, and I think I might say with all the members of the Committee, that it is essential that every man, whether he is going to be a teacher or a practical farmer, should have practical knowledge of farming?—Assuredly.

11805. In the case of Scotch colleges it is almost universal?—Yes, we give no degree without it.

11806. The students at your colleges mostly come from farms, do they?—Not entirely.

11807. Do professional men's sons come?—Yes.

11808. Then they must do work on a farm before they come to you?—Before they can get a diploma they must have done that and they also have to pass a very stiff examination on practical work.

11809. Two of the universities in England have informed us that they propose to conduct a certain amount of research work accompanied by little or no oral teaching: I suppose you agree that is valuable?—I should hardly think it would be advisable to have original research dovetailed into the teaching to any great extent.

11810. (*By Lord Belper.*) You are Secretary of the Highland and Agricultural Society, and I suppose you can tell us in what way your Society has promoted agricultural education to such a large extent. Was it merely by examinations or was it by giving funds, or promoting teaching, or what were the lines you worked on?—Originally it was mainly, apart from examination, by giving grants to such centres as did exist for instruction. For many years the Society gave £150 a year towards the Chair of Agriculture in the University of Edinburgh. I think the actual sum the Society has expended in promoting agricultural education would be about £17,000 to £20,000.

11811. In how many years is that?—That would be spread over more than 50 years.

11812. Are your funds provided by voluntary subscription?—Entirely.

11813. The members of your Society supported the view you took that it was very important for agriculture that a large institution like yours should spend a considerable part of its funds in promoting agricultural education?—That was the general desire of the members.

11814. In that way you have set a very happy example to many other societies which, unfortunately, they have not followed?—I do not know.

11815. I notice you say here that you think the Government is now about to take its proper place in the direction and stimulation of agricultural education, and that, therefore, you assume that the more strictly educational work of the national agricultural societies is nearing its completion?—That is in carrying out strictly educational work.

11816. You would admit, of course, that there is still a large field for you in developing agricultural education, you being in touch with the farmers, and when you have a number of proper institutions for teaching agriculture about you you could do an enormous amount in getting farmers and members of associations in touch with the teaching of those colleges?—That is so, and also in research. Our Society has no desire, as far as I can gather, to lessen its outlays in the educational cause generally, but it is thought the time has come when the Society should more largely devote its aid to research and to assisting and encouraging farmers to make good use of the instruction supplied through the colleges.

11817. Your view would be that any representative agricultural society, if it is to do the work which it is supposed to be doing, ought to spend a considerable amount of its money and time in doing their best to promote agricultural education?—Clearly.

11818. The mere giving of prizes for stock at shows is only the more limited part of the work that such a society ought to take up?—It is only a part at any rate. I suppose there would be a difference of opinion as to the extent to which it should be carried, but still it is only a part.

11818A. I do not want to confine you to the extent but, I think, it is now admitted that agricultural education is so important in farmers' interests that a society which is really an agricultural society ought not to neglect that branch of the work?—There is, I believe, a definite view amongst our members with regard to this. Now that the Government is taking in hand, as it ought to, the direction and maintenance of agricultural education, it

is felt that there should be no need for agricultural societies continuing to contribute funds for teaching, but that they might with advantage apply their help to departments, notably research, not covered by Government grants.

11819. What is very much neglected is local organisation in order to bring farmers in touch with colleges and schools of agriculture which are put within their reach?—Clearly.

11820. A society representing farmers can do that when it is very often difficult for the college to do it themselves?—Our Society has long been endeavouring to do some good work in that direction, and it intends to continue that work.

11821. I am glad we have had the advantage of hearing your views as representing your Society, because it is quite clear you have been in the fore-front in recognising how important it was for the farmers to get the assistance you could give them in promoting agricultural education?—Yes.

11822. (*By Lord Moreton.*) You have been connected since its inception with the National Diploma Board?—I have.

11823. I gather from what you have said that you think the time has come when a change might be made in the conduct of the examination, and in the body organising the examination?—With regard to the latter point my feeling is that the time has come when the body we originally hoped would begin it should take it up; the Societies undertook these examinations only when they did not succeed in inducing the Government to do it.

11824. You would approve, if possible, of the examination being held at various centres instead of at one centre I take it?—I would.

11825. Do you think that the two societies who now conduct the examination could possibly find the money that would be necessary to multiply the places of examination?—I think that is very doubtful.

11826. In other words, I may take it you think if the examination is to be taken into various localities it must be done by the Government; that it is impossible to hope that the two Societies could possibly manage to do it themselves?—I do not think they would be disposed to do it.

11827. All your evidence here has been with regard to the examination in agriculture?—Yes.

11828. Do you wish to say anything to the Committee as regards the examination in dairying?—I do not think there is anything special. The dairying examination began before the agricultural examination, and education in dairying is in a more advanced condition throughout the country, so advanced, indeed, that in Scotland we feel that the National Diploma has done its work completely.

11829. When you say done its work completely, do you mean it has done its work so well that there is no future need of such an examination?—What I mean is that the colleges, accepting the inspiration of the National Dairy Diploma movement, are now working on the lines of it, and our Society feel that there is little use in spending money in duplicating what the colleges are doing, or, I believe, are about to do, themselves.

11830. I take it that if the Government, or the Board of Agriculture, saw fit to step forward and take the lead in the diploma work you would see no objection to their confining the colleges to what is called the agricultural diploma, and leave the dairy part as it was before the examination was instituted?—I would hope that the Government would take the dairy work under its supervision and care as well as the agricultural work.

11831. (*By Mr. Latham.*) Would you be willing to give us some little information as to what the education in Scotland generally is?—There are the three Colleges in Scotland, in Edinburgh, Glasgow, and Aberdeen, and at each there is a three years' course in agriculture, on all fours with the syllabus of the National Diploma in Agriculture. Each college has in addition a considerable staff for provincial work, giving lectures in agriculture, and the sciences relating to agriculture, in different districts. A great deal of work has been done during the past few years in that direction, and that has helped greatly to interest farmers, and to bring about that better reception that farmers generally are giving to the work of the colleges.

11832. When you first began you said there was a very great change in the way in which science was being received by farmers in Scotland?—Yes.

11833. Have you any farms attached to these centres?—There are no farms held by the Scottish Colleges. In the West of Scotland there is a farm leased by the college, but it is sub-let to another farmer, and only a limited area

Mr. J.
Macdonald.
—
27 June, 1907
—

retained for experiments. It is a point as to which there is a difference of opinion in Scotland, the having of a college farm. They regard it as of great advantage for a student to have access to a farm, but many of the governors of the colleges are shy about undertaking the responsibility of a farm, largely in view of the difficulty of making a college farm a direct financial success.

11834. Is there not another view, that Scotch farmers feel they know more about practical agriculture than the colleges do?—That is a feeling which I am glad to say is breaking down a little.

11835. How are these young men prepared before they have the opportunity of going to the colleges?—Just a very good general education, mostly at the parish schools; some at a central school.

11836. May the parish schools be described as elementary schools?—Of course they do the elementary work, but a large number of them in Scotland carry the pupils right up to the University.

11837. At these elementary schools you have advanced classes that carry your students right to the University without the aid of secondary schools?—Many of them, not all through, but in many parts of the country.

11838. I suppose it is fair to ask you, is that a very beneficial way of giving teaching?—Very beneficial, I think.

11839. It almost does away with the idea of the secondary school?—At any rate it gives to out-of-the-way districts the advantages of a central school that they could not afford otherwise.

11840. Is this education principally given by national aid or by the rates?—It is altogether under the Education Act of 1872 and subsequent amending Acts.

11841. You have no way of improving your farm stock in Scotland by any outside aid, have you?—Education has taken little part in that yet; that is left to the operation of societies. In some cases breed societies have been specially organised for that purpose.

11842. Are you aware of what is being carried on in Ireland in that respect at present?—I know what is being done in Ireland. I had the management of some of the breeding schemes there. We have nothing corresponding to that in Scotland.

11843. What is your opinion with regard to that?—On certain lines it is entirely advantageous, but on certain other lines I am doubtful. If worked entirely through shows I am not sure that it would always be advantageous, but when it is directed by breeding organisations, special attention being given to the selection of breeding animals, it is of great advantage.

11844. I suppose it is really a more certain and a more thorough examination as regards sire animals than that carried on anywhere else?—They have carried it out very thoroughly in Ireland, there is no doubt about that.

11845. Do you not think as a practical man that that is a thing to be very widely recommended?—Yes.

11846. You would like to see something of the sort going on in Scotland?—I should be very pleased to; I think it would be very advantageous indeed.

11847. Do you think the Scotch farmers would welcome anything of the sort?—I am sure they would.

11848. Is there anything done in Scotland to educate the labourer?—I do not think there are any organised classes for training or instructing young farm labourers in any methods of their work. I think that is just left to their fathers or their masters, and I do not think it is very badly neglected.

11849. When I heard you were coming here I meant to ask you particularly that question. The farmers in Scotland are good enough men, and masters of their business, to be able to instruct the men themselves?—I think so.

11850. And very much so in the case of the sons?—Yes, and in many cases the servants are just as capable as the masters.

11851. (*By Professor Middleton.*) You told us, speaking about the practical teaching of agriculture that the instruction from the practical point of view was not satisfactory at the present time. I entirely agree with you. I have been a teacher of practical agriculture for 20 years, and I consider it quite unsatisfactory. I should like you to

explain, however, just a little more what you have in view with regard to that?—One would like a little more of it for one thing.

11852. Might I put it in this way: you will agree with me, I think, that the practical farmer is a specialist—he takes up certain departments of agriculture. Did you ever see a farmer who took up all the branches of agriculture and made a success of it?—Very few indeed.

11853. Did you ever know of a professor who was not supposed to teach all the branches of Agriculture?—I have not met very many who really pretended that they knew all the branches.

11854. Just so, but they are supposed to. Do you think agricultural teaching will ever be quite satisfactory until the teachers specialise in each branch of it?—Quite so—on the American system, where they specialise in each subject.

11855. Exactly. They divide the subject of agriculture up into its natural groups, and each man who takes up a group is a specialist in that particular line—the live-stock man is a specialist in live stock; the man who takes crop growing is a specialist in crops, and so on?—That is so.

11856. Your feeling is that our teachers are unsatisfactory because they distribute their energies all over the subject?—Yes, but of course they are required to do it, and at the same time, I am bound to say many of them have done remarkably good work.

11857. You have further indicated that our system of training teachers is not satisfactory. May I say I agree with you again, but I should like you, if you will, to amplify that a little?—Well, there is no system really; it has not begun. There is no pretence to system yet. We have heard it discussed whether the National Diploma is intended to train teachers or farmers. I do not think we have attempted anything in the direction of special training for teachers yet, I am sorry to say.

11858. Have you any idea of the type of training you would give in order to prepare the teacher. I do not know whether you have given any thought to that subject?—I would prefer the man who had an inclination to it from youth, and who has had a familiarity with it in youth, but I would not adhere strictly to that limit.

11859. You have expressed another opinion which I am afraid I do not agree with. You said that original research and teaching should not be dove-tailed together; that we ought to keep them separate?—Yes; in a certain sense and to a certain extent that is my opinion.

1 860. Is that your opinion of the subject in general, or does it apply only to certain grades of education?—It applies to this, that I would distinguish between the work of a teacher in imparting instruction and his work in carrying out research. Might I mention an incident that occurred about twenty years ago in connection with this question of the relation of research to teaching. Some of us had become enamoured of a scheme for the founding of a great College of Agriculture, near Rothamsted, so that the students might have easy access to the famous Experiment Station there. It fell to me to ask the opinion of Sir John Bennet Lawes on the project, and in giving an opinion which put an end to the scheme, he stated that he was so strongly impressed with the danger of submitting unfinished original research to students that he thought of providing that students as students should not be admitted to Rothamsted.

11861. Do you not think in the higher departments of education at the colleges that we ought to require teachers themselves to be engaged in some forms of research?—I say there ought to be scope for research in connection with each college, but that should be for the purpose of gaining knowledge.

11862. Do you think the teachers would remain satisfactory if they were not carrying out research work?—I do not think they would, but I do not regard research as teaching; teaching is the dissemination of known facts, research is the seeking for new. I would leave it to the teacher to exercise his most careful discretion in explaining to the students the results of his research year by year as it proceeds. I am here, of course, speaking of original research as distinguished from demonstration experiments. The latter are essential in teaching.

11863. Your point is that where there is a teacher himself who is conducting research work that he should only teach his students well-ascertained facts?—Quite so; that is my point exactly.

11864. I have been in Austria and Germany recently,

and I tried to ascertain the feeling in those two countries on this particular subject, almost the universal opinion is that unless a teacher continues doing research work he becomes useless?—I quite agree.

11865. I see the conviction has been forced upon you that a central examination is after all not satisfactory?—No new conviction has been forced upon me; I had a very clear understanding with regard to that from the very beginning, but nothing else was practicable then.

11866. The central examination was instituted, was it not, for the purposes of what I might call organisation?—Yes, to assist organisation; to assist different bodies to work into a system, and to set up ideals which might, or might not, be the best possible, but might be tried—particularly to encourage the institutions to work to a system.

11867. You have been of opinion all along that the holding of a single examination is a disadvantage as compared with two examinations, one in the North, and one in the South?—Decidedly, and we did not think the system of one central examination would have gone on so long as it has done.

11868. You have expressed the opinion that a multiplicity of diplomas and degrees is undesirable—a multiplicity of letters?—Yes.

11869. Of course, in a certain sense everyone agrees with that, but do you not agree, that if there is any responsible institution which is charged with the teaching and the training of young men, that that responsible institution ought to have the right to give a diploma?—Entirely. All my remark applied to was this: that whatever examinations were held at the colleges, and whatever diplomas or degrees were given, they should be so adjusted in relation to others that there would be a general understanding of the value of each single degree. Take the B.Sc. in the various Universities, its value is very well known everywhere, and my suggestion was that the degrees in agriculture should follow such a line as that.

11870. When a University, or any other examining body sets up a degree there is no standard at first, and the different Universities find their level?—That might be so at the outset.

11871. The tendency in Universities is always to keep the level as high as possible?—Yes.

11872. It is the policy of all bodies of that sort to keep the examinations for the degrees as stiff as they can?—Yes, as a rule it is.

11873. Do you not agree that the same sort of thing is likely to happen with diplomas as with degrees—to begin with, there may be inequality, but it is the interest of the college to keep up the standard?—Yes, and I would merely direct national influence to the minimum and allow colleges to go as high as they can. Take the case of the General Medical Council and their attitude towards the schools of medicine. The object of their periodical visits to the Universities is to see that the minimum is as it ought to be. I would follow that line exactly in regard to agricultural schools. The maximum may be left to take care of itself.

11874. In one of your specific recommendations here, No. 5, you say, "The suggested Council would lay down regulations for conducting the examinations in these recognised institutions for the diplomas, the Council having the power to have present assessors or examiners." Would you not have some fear that that would be resented by the institutions concerned?—The General Medical Council laid down the lines of the course of study for the medical degree, or at least have a voice in the matter, and that is not resented by the Universities.

11875. That is a little different from agriculture; medicine is a close profession whose interests are looked after by the General Medical Council very keenly?—I should be very glad if we could apply something similar to agriculture.

11876. Your idea is that we should have a National Agricultural Council similar to the General Medical Council?—Yes, but not with such extraordinary powers I admit. I should like to see an Agricultural Council which would foster agricultural education in a suggestive way rather than by forcing it; the more suggestive it is, and the less forcing, the better it would be.

11877. You know how much governors of colleges are apt to resent outside suggestions when the suggestions are a little too strong?—Yes, I quite appreciate that.

11878. You have come to the conclusion that the

National Diploma in Dairying is no longer needed?—No, I did not quite mean that; I want to see something else in its place before it is discontinued.

11879. I understood you to say that the colleges in Scotland had got their own diplomas?—The matter is under consideration at present, but unless the proposed college examination is found to be satisfactory the National Diploma cannot be dropped.

11880. I understood you to say that we had already arrived at a stage at which you thought we could drop the National Diploma?—I hope I did not give the idea that I thought the National could be dropped before a substitute was found for it.

11881. As regards the National Diploma in Agriculture I see your idea is that, so far as possible, we ought to drop independent examination?—So far as possible we ought to take up examinations in closer touch with the leading colleges, and, of course, if the dropping of the large central examination is incidental to that, then let it go; but I am not sure that there would not still be a demand from the smaller institutions for an independent examination also.

11882. Just in the same way as the General Medical Council do, you would have this proposed National Agricultural Council to accept the diplomas of colleges?—Certainly, that has been my idea from the beginning; it would never be satisfactory unless it did.

11883. I am glad to hear you lay stress on the necessity for ascertaining the results of what the student has done in his class work?—Yes, we have found that a great advantage in Scotland.

11884. That is the objection really to a single examination?—It is an objection to all examinations when class records are not considered. Unfortunately Universities still disregard class records in degree examinations.

11885. (*By Mr. Medd.*) Am I to understand that, with the exception of the Colleges at Aberdeen and Edinburgh and Glasgow, there is no organised agricultural education in Scotland?—None, except what is in one way or another associated with one or other of these colleges.

11886. Of what may that be said to consist taking the country as a whole—lectures?—Each college has its own staff of provincial lecturers.

11887. I know, but I meant in regard to other localities?—Scotland has three colleges. Each of those colleges has its own number of counties associated with it, and it is responsible for the work in those various counties.

11888. At the present moment you have no permanent institution for intermediate agricultural education, subsidiary, of course, to the College?—They are just making a beginning in that work.

11889. In the Dick Bequest Schools under your present code has anything been done of an agricultural character?—Nothing more than nature knowledge classes.

11890. Not even with the older students?—No.

11891. Nor in your supplementary courses?—No; only nature knowledge.

11892. In the supplementary courses very excellent suggestions appear in the volume of circular letters?—That is so. In Edinburgh we have before us now suggestions as to the assistance which the colleges could give in providing teachers to visit district schools, and take up instruction suited for advanced boys and girls.

11893. Because you might have a really practical supplementary course?—That is so.

11894. Does the same remark apply to higher elementary schools—higher grade, I think you call them?—Yes, that is so.

11895. Nothing of a definite nature however has been done at present?—Nothing practical.

11896. Are you familiar with the organisation of the Duchess of Sutherland's school?—I know something of it.

11897. Have you been there?—No.

11898. You are not able to form an opinion whether schools of that type are applicable at all to the conditions of English rural life?—I would not like to offer an opinion.

11899. The school is, of course, purely in an experimental stage at present: it has hardly had time to justify itself apart from questions as to its organisation?—Quite so.

11900. You have nothing in the nature of permanent winter schools?—Nothing beyond what I have already mentioned.

11901. Nothing beyond the winter classes at these three

Mr. J.
Macdonald.
—
27 June, 1907
—

Mr. J. Macdonald. colleges?—Nothing beyond classes in or in connection with these colleges.

27 June, 1907 11902. Exactly, but what I mean was permanent winter schools established in particular localities for a period of five or six months?—We have nothing of that kind yet, but we hope to have.

11903. (*By Mr. Davies.*) I think you told the Committee that the Department of Agriculture in connection with the University of Edinburgh was doing very good work, and what I should like to ask you in that connection is do you consider it advisable that agricultural colleges should be dumped down in country places without any educational surroundings, and without being part and parcel of a University, or do you think that they should be part and parcel of a University?—I think from experience we have gained great advantage from having the colleges in near touch with Universities. It is an advantage to the students. That system is a much better one than the system of isolated agricultural colleges.

11904. So that with regard to any new agricultural colleges which were to be established in future in the country, if you had anything to do with it you would always advise that they should be affiliated, or be as near as possible to a university centre?—Certainly, if the University is there.

11905. (*By Lord Barnard.*) I have before me a list of the gentlemen engaged in teaching at a certain college, and I see some of them have the ordinary degrees, M.A. and B.Sc., and two of them have F.H.A.S.?—Yes, those are the letters that the Highland and Agricultural Society allowed holders of its Diploma to use. It means Fellow of the Highland and Agricultural Society.

11906. What conferred the right to use that title?—It was, I may say, a very stiff examination; it was the forerunner of the National Diploma on the Scotch side, and it corresponded to M.R.A.S.E.

11907. Those letters indicate some real test of qualification?—Quite so.

11908. I believe as a whole the people at the schools in Scotland all get a very good general education, do they not?—They have very good schools indeed in most parts of the country.

11909. They are probably better off than this country in the way of public schools?—There are certain parts of Scotland which are decidedly inferior to the rest in that respect. A particularly high-class elementary and general education is provided, especially in the North Eastern Counties where the Dick and other valuable bequests have been in operation for nearly a hundred years.

11910. (*By Professor Middleton.*) Every schoolmaster had to be a Master of Arts in the Dick district, I think?—Yes, and right away in the heart of the hills, you would have a Master of Arts at one of these schools who was quite capable of carrying a boy right up to the University.

11911. (*By Lord Barnard.*) Do county councils, or local authorities, do anything in the way of either aiding or stimulating or providing agricultural instruction in Scotland?—They provide half the funds for the colleges at present out of the funds at their disposal—practically one half.

11912. Do they subsidise any other institutions as they do in England?—They did that before the colleges were instituted, but now almost all their work is carried out in connection with the colleges. They work with the colleges very loyally indeed.

11913. Is it the practice in Scotland for young men to be sent as pupils to farms—do practical farmers take pupils?—Yes, farmers take farm pupils very largely in Scotland. These pupils are generally lads who have come from other lines of life. Where a professional or commercial man has been desirous of sending his son into farming, he has very often taken the course of sending his son for a period to live with a good farmer and practice under him.

11914. If that system is properly carried out the system is a satisfactory one?—Very satisfactory indeed.

Mr. Wm. H. DUNN, called and examined.

Mr. W. H. Dunn. 11915. (*By Lord Barnard.*) I think you are the Chairman of the Berkshire County Council?—I am.

11916. You were at one time Vice-Chairman of the Education Committee of that Council?—Yes, and am now. I was Chairman of the Higher Education Committee, that is more nearly the thing we have to deal with. In our county it is separated into two parts, the elementary and the higher education. I was Chairman of the Higher Education Committee, but I have given that up since I have been Chairman of the County Council, and am now Vice-Chairman of the Committee for Higher Education.

11917. Your county is almost entirely an agricultural county?—Quite.

11918. May I take it for granted that your County Council wish to do anything they can to promote the prosperity of the agricultural interest?—Certainly.

11919. But in spite of any good wishes or intentions they may have in that direction I think I am right in saying the evidence this Committee has had at present is that there has been a decrease in the expenditure for the purposes of agricultural education?—A very large one, certainly.

11920. It would be interesting to the Committee to hear from you the cause of that?—I wrote a letter some 10 days ago to the Secretary of this Committee and I do not know that I can supplement very much what I said in that letter. At present we have to meet compulsory calls on us by the Board of Education in the way of pupil teachers' centres, and various calls of that kind amounting roughly to something like £2,000 a year, which of course we had not in the former days before this new Education Bill came in in 1902. So that that makes a difference in round figures of £2,000 a year to us. I have a statement here that was drawn up by the Clerk to the County Council as to what the position was in the old days when the Technical Education Committee was in force. For instance, take the first year of which I have a memorandum here, 1894, that is 13 years ago, the University College at Reading, the Agricultural Department got £200—I am leaving out the shillings and pence—the Dairy School got £553, Berkshire Bee Keepers' Association £50, Farriery School £442, and

scholarships which were in the main intended for agriculture in those days amounted to £881, making a total of £2,127; that was in 1894. Then in 1896—I will give you the total unless you wish for the items separately?—

11921. No.—In 1896 the total was £1,719; in 1897, £1,353; in 1898, £1,199; in 1899 it came out at £777; in 1900, £815; in 1901, £775; in 1902, £780; and in 1903, £687. All that we really ought to give now in the way of agricultural education we have not got the money for, and to meet the calls upon us for the first time in our estimates this year, for the coming year ending in March, 1908, we have levied a rate for higher education; this is the first time we have ever done that.

11922. Did that meet with any opposition?—No, I thought it would have, but it did not. I may say it is only a small rate, a halfpenny rate, and it amounts to about £2,300 a year, which is just what we wanted. It just covers what we wanted. I will hand you this list. Those that I have marked in red ink are the estimates for next year, and I do not think you will find, if you look at the items which make up the sums, that there is anything for what you can really call agricultural education there—I think it comes to very close on £2,000—I mean the King's scholarship classes, pupil teachers' centres, teaching exhibitions, and all those things we have got to meet, and there is not one penny of that does us any good from an agricultural point of view, I am sorry to say, but we have got to do it. I have kicked against it very much, but it is perfectly impossible; you have got to do it, and there is an end of the matter.

11923. Those are statutory obligations?—Yes, those are obligatory upon us; the Board of Education say we have got to do it, and we cannot help ourselves. We had horticultural classes at one time; they were of very small expense comparatively, but I do not think they were of any very great service.

11924. This Committee must take it from you that it is absolutely impossible for your Committee to do anything more for agricultural education out of the funds at the disposal of the county?—Certainly.

11925. It is not a question of willingness at all, it is a

Mr. W. H.
Dunn.
—
27 June, 1907
—

question of lack of funds?—I can only answer for my own county, and we would be very glad to do it, because we are all interested in land; we are all more or less unfortunate landowners there, and it more or less concerns us, and we naturally would do anything we could to benefit the land and raise the standard of agricultural education. There is not a manufacturing town in the county, except perhaps Reading, Huntley & Palmer's place, which does not help us much except in the way of taking milk. However, we have nothing to do with Reading, so that there is no other industry in the whole county but agriculture.

11926. Has the subject been discussed at your committee meetings?—Yes, over and over again, to see if we can do anything.

11927. Have you ever expressed an opinion that something should be done, and to see if funds could be provided?—We are ready to do it, but it is cut down so close; in fact, there was a question the other day as to some farriery classes, and it was advocated very strongly, but we said, "What can we do, we have not got the money; we are pressed now for scholarship classes under the education scheme, and we cannot give to both; we have got to do one, we have got to do what we are driven to do."

11928. Are you establishing secondary schools all over the county?—Yes, wherever we can; we have established one. There is one at Newbury, which we subsidise, and there is a school at Maidenhead which got into very low water; we practically had to take that over and run it ourselves. We are shortly going to apply for a loan to establish a school at Windsor; we are running secondary schools at Wallingford, Wantage and Abingdon. That is as far as the boys are concerned; I am talking of boys' schools now. We have started a secondary school for girls at Newbury and another at Maidenhead.

11929. (By Mr. Latham.) The Wallingford School is the old Grammar School?—Yes, but we are running it now; it was absolutely "broke," and they said they would have to shut up entirely; they came to us and we took it over, but it is in debt now although it has been running for three years.

11930. (By Lord Barnard.) Is it more economical for the county to put the existing schools on a sound basis than to start new ones?—Yes, it is more economical to the county if the teaching is good enough in the old ones to meet the requirements of the present day.

11931. You can make them Council schools?—Yes, but that necessitates a considerable loan.

11932. I do not know whether you have seen the reference to this Committee?—Yes.

11933. I do not suppose we shall report county by county, but I take it if we did we could hardly say that the provision of agricultural education in Berkshire is sufficient?—Most certainly not.

11934. We could not say that it would be supplemented from the resources of the County Council, that is quite clear?—Quite clear.

11935. And I am sure you will agree with me that you cannot look to landowners or to farmers like Mr. Latham to put their hands very deeply into their pockets for such a purpose?—Certainly not.

11936. Possibly public benefactors may come along, but you cannot wait for those, so that really and truly the only source to which we can go is the Treasury?—That is all—at least as far as I can see.

11937. You agree with me that the National Exchequer is the only way by which, to take a county like Berkshire, the existing provision can be supplemented and made satisfactory?—I fully agree.

11938. There is no prospect, is there, I will not say even in the immediate future, but as far as you can see in the future, of your Council having some funds at its disposal so that it can again bring the grants for this purpose up to the level at which they were?—I do not see a chance of it; we are driven, as I said just now, by the Board of Education, and we have more applications now to start other secondary schools in the county, and we have to say we cannot do it; we cannot do anything.

11939. Does your Education Committee have an Agricultural sub-committee or any special committee?—No; but it was in the scheme included in the Bill, and it was adapted to suit our county. Our Education Committee consists of 31 members, and one of them was especially to

be appointed in the agricultural interest. At the present moment Mr. Childs, the Principal of Reading College, is on the Education Committee, and he fights for his own hand as well as he can, but he sees the difficulty of it himself.

11940. You do subsidise Reading College?—We give them £400 in a lump sum, but I cannot tell you how it is spent.

11941. (By Mr. Latham.) That is not earmarked?—That is not earmarked at all, and it was only last Saturday at a meeting of the Committee we were saying that to Mr. Childs.

11942. (By Lord Barnard.) You are represented on the governing body of the College?—Yes.

11943. So that you can ascertain from your own representatives what is being done by the College?—We can ascertain, but I do not think any one of our representatives on the governing body can tell us exactly where our £400 goes to. I know those on the governing body well—I was on it myself, but I had not time to go on with it, and I had to give it up—and I could not tell you where the £400 goes, beyond that it is given in a lump sum.

11944. You do not question that the College is doing good work?—Not at all; it is doing very good work—very good work indeed.

11945. Would you kindly tell me whether you have a special committee on your County Council—I know you must have a special committee under the Act—or whether you delegate the duties to be performed under the Diseases of Animals Act to some existing committee?—They have a special committee of their own who do nothing else; they have powers delegated to them to act, and if they get a telegram, for instance, notifying them of a disease they have to attend to it at once. I may say they got one only the other day.

11946. Does the Fertilisers Act come under the same committee?—That is the Weights and Measures I understand. I am not on either of them.

11947. It has been suggested to us by a witness of great experience that all agricultural matters, including agricultural education, might with advantage be dealt with by one committee of the County Council. Do you think such a thing would be practicable?—If you are going to make one committee you would have to enlarge that committee very considerably.

11948. Possibly you would have to have outside co-opted members?—Yes.

11949. I do not know whether you have thought of that subject?—No, I cannot say that I have. I know they have one in Wiltshire. I happen to know the chairman very well, and I know they have got one there.

11950. Yes, we have heard about that?—Yes.

11951. (By Lord Moreton.) In these secondary schools that you are running, have you in any case started the teaching of agriculture there?—No.

11952. You have not got an agricultural side to them?—No.

11953. (By Mr. Latham.) When we began in 1904 and gave £2,000 for the benefit of agriculture, there was really nothing else for that money to be allocated to, was there?—No.

11954. The Act of 1902 has robbed agriculture of a very large sum?—Undoubtedly, and we are doing now what we are driven to do. In 1894 we had a sum of money put into our hands, and we were told to use it in the best way we could in the county for technical education as it was called. We were told to find out practically what was the technical education best suited to the needs of the county, but now we have got a sum put into our hands, and we are told by the Board of Education: you have got to do this and you have got to do that, and the thing is swamped up at once.

11955. You know better than I do that the agricultural interest pays a large proportion of the rates in Berkshire?—Yes.

11956. This small amount of money, £450, which you give to Reading?—It was £450, but it is only £400 in the estimates for next year.

11958. That is a very small sum considering the amount of rates the agriculturists pay in the county. So that really the towns are reaping a great deal more benefit from the "whisky money" than the agriculturists are?—Yes.

11959. The secondary schools you have started—I

Mr. W. H.
Dunn.
—
27 June, 1907
—

know they are very small at the present time in number—have no agricultural side to them and no teaching of agriculture whatever, and possibly they are of no direct benefit to agriculture?—I do not think at any of the schools in Berkshire that the teaching directly benefits agriculture. They all seem to me, as far as I can make out, to be pushing the boys from the secondary schools to the Universities, and to be ignoring the question of agriculture altogether.

11960. We may take it that the £400 you give to the College at Reading is not earmarked particularly for any purpose?—No.

11961. That is the whole amount from the “whisky money” that goes to the benefit of agriculture at all?—That is all.

11962. I know myself pretty well how it is allocated. I dare say you will agree with me that it is a serious loss to the agricultural community that you have been obliged to take something like £1,600 away from agricultural education?—Undoubtedly.

11963. Having read the reference to us, I feel confident you would welcome very much some augmentation of the money at the disposal of your Committee for the purpose of benefiting agriculture?—Undoubtedly we would; we are so closely bound up in the question of agriculture that we would do all we could to further it.

11964. With regard to some of the work that has been taken in hand, the dairy school was very successful?—Very.

11965. The farriery especially so?—Yes; I may say we had the peripatetic dairy school going for some considerable time, and we gave it up at last, because we thought we had pretty well worked the county out. We stopped it for two or three years, and then when we wanted to start it again we had not got the money, because in the meantime this new Bill came along, and the money we wanted for the dairy school was swamped for the elementary and other schools in the county.

11966. The same thing applies to the farriery school?—Exactly the same.

11967. You are willing to admit there was a very good and valuable work done in the farriery school, are you not?—Very good indeed.

11968. The diminution in the amount of money you have at your disposal has been a very serious loss to agriculture, and you would welcome any augmentation of it in the county?—Very much so.

11969. With regard to the elementary schools, are there any scholarships attached to them?—Yes, both senior and junior, and teaching exhibitions too.

11970. Where are they allocated to?—You mean the secondary school to which they move from the elementary?

11971. I want to know where the students go to if they win a scholarship?—They go to some of the secondary schools in the county—to Newbury, Reading, Wallingford, Wantage, Maidenhead and Abingdon. The scholarship pupils go to any one of the secondary schools in the county, either boys or girls.

11972. With regard to the secondary schools in Berkshire, are there any scholarships given there to raise them up to Reading College?—No, none earmarked for Reading, because if you took a scholarship from an elementary school, Reading College would take the place then of a secondary school.

11973. You do not quite understand. When we were on our old Education Committee we used to give farmers' sons an opportunity of going to a special school?—Yes.

11974. Is there anything to correspond with that in the county now?—No; a boy or girl gets a scholarship, and if they live near Reading and the parents wish them to go to Reading and take the course of classes there they can do it, but there is nothing especial for farmers' sons or relations to go to.

11975. At the present moment are there any scholarships by which students from the secondary schools can go to Reading or anywhere?—Yes.

11976. That rather alters the aspect of affairs, because if you give Reading £400 a year, if the scholarships were taken up, it would be a certain amount of additional money that was allocated to agriculture. How many go to Reading?—It is a very small number that go to Reading. They go to Reading, but they do not all go as agricultural pupils there. I do not say that one or two may not, but the majority do not.

11977. We have virtually lost all our agricultural

scholarships?—Yes, we have lost those. We used to earmark those in former days for agricultural scholarships, but now we give a lump sum and ask Reading College if they will let us know annually how that money, or the bulk of it, is spent. We have had one or two statements from them, but we have not got any nearer to finding out yet, and we have not any idea how it is spent.

11978. There is nothing else whatever, I take it, for the benefit of agriculture?—No. I think you may take it there is nothing more than that £400 a year.

11979. (By Mr. Medd.) Can you kindly explain why agriculture is treated so differently in Berkshire from Cambridgeshire; I may mention the figures to you. Cambridge, out of the whisky money, gets £3,824, and allocates £1,045 to agriculture. Berkshire gets £5,729, and allocates £400. That is £2,000 more than Cambridgeshire, and yet it only allocates £400 to agriculture. Why should there be that startling difference?—I think one reason that will account for it is that we had practically, with one or two exceptions, the old-fashioned grammar schools. We had about five secondary schools, and certainly not one for girls. The County Council started the first one at Newbury for girls. I have often heard from the parents of girls myself, “There is nowhere where I can send my girl to.” We had some scholarships—Mr. Latham will remember this—for girls, as we have now, but we had not a single school in the county to send them to, and we had to send our girls out of the county to utilise our scholarships in another county.

11980. Cambridgeshire has been called upon to find very large sums to establish its county school for boys and its county school for girls, in both of which the interests of agriculture are specially considered, so that there ought not to be, so far as I can see from your evidence, any reason why the agriculturist in Berkshire should be placed at such a disadvantage as compared with the one in Cambridgeshire, because you are essentially agricultural, are you not?—Yes.

11981. I believe your labourer is not entirely satisfactory, is he?—I do not know that they are any worse than others. They are mostly on the grumble, I think, everywhere.

11982. Is it not the fact, especially in the neighbourhood of Newbury, that you import northern labour?—I do not think it is very largely done: it was much more general years ago: I do not think it is much done now.

11983. You used to import Yorkshire and Northumberland labour, and the interesting fact about it was that in some five years' time or so the imported labour sank to the level of the local labour?—I do not think they import labour now. There has never been any imported in my district. They used to import Irish labour some years ago, but you never see an Irishman about the place now.

11984. The Irishman would probably be paid at the local rate. You do nothing for the training of elementary teachers in rural subjects, do you?—Not in rural subjects, beyond what we do in the nature study classes in the elementary schools.

11985. You have those?—Yes: it is an optional matter for the teachers to take up in the schools.

11986. I mean rather in the training of the teacher to qualify him to take those subjects. You do not make any provision for that, do you?—Not specially.

11987. Do you not think you might earmark a portion of your grant to Reading for the special purpose of training a certain number of your teachers in these rural subjects. You see from your statement here and from your evidence the whole of the money your County Council allocates to agriculture goes to Reading?—Yes.

11988. Do you not think that you might suggest the earmarking a portion of that for the training of your Berkshire teachers in rural subjects?—I think they would say; “You must give us so much more to do it,” because they grumble enough at the smallness of the grant. I think the answer we would get would be that they cannot do it with the existing grant.

11989. Naturally they want as much money as they can handle?—Of course.

11990. I think in making the grant for the next year you might attach such a condition as this; “On consideration of our allotting the whole of our agricultural money to you, you must undertake to allow 15 to 20 of our teachers, whom we will nominate, to attend your teachers' classes.”—You would probably get very large classes, and, on the other hand, the expense does not stop there, because these teachers come from different parts of the county, and they would not pay their own fares. We have to pay the

Mr. W. H.
Dunn.

27 June, 1907

fares of many of our scholars now: the question of railway fares runs into a very, very large sum indeed in the county, and we should have to do that plus the £400.

11991. Your amount of the "whisky money" is not inconsiderable. It compares very favourably with counties that do a great deal more, and I was only endeavouring to suggest ways in which you could, without incurring any large expenditure, do something more for agriculture?—May I mention, taking last year, for instance, up to March, with regard to our secondary schools that Lord Moreton asked about—this Newbury girls' school, for instance, where they can take our scholarships from the elementary schools—the estimate for that school alone is £1,450. Then there is the one at Maidenhead, which is a smaller one. It is a very flourishing one at Newbury, but we have only adapted buildings to it for the time, we have not built a school there.

11992. That £1,400 is for maintenance?—Yes, all these sums are for maintenance. Maidenhead is £620, and there are urban classes that we give, that runs away with over £2,000, and of course there is a certain amount of teaching in that that might come under the head you mean.

11993. It may be that you in Berkshire are considering the urban interests of your county to the almost entire exclusion of the rural interests. That is to say, when you compare Berkshire with the counties of corresponding constitution. Of course I do not know, because I do not live in Berkshire, but that is what suggests itself to me?—I see the point you mean.

11994. You may have upon your County Council a preponderating urban interest?—I do not think we have.

11995. And consequently these large sums annually allocated to the maintenance of schools wholly unconnected with agriculture, and the very small amount which goes to one institution at Reading implies that otherwise you neglect the agricultural industry altogether?—You see, we have these evening classes. They are a matter of about £400 or £500 a year. We endeavour to keep them going, but they drop out very much. It depends a very great deal on the teacher there. Sometimes they take them up very warmly at first, and then when they have been started, and a certain amount of money has been expended, they drop out, and it is rather heartbreaking work to keep them up.

11996. Do you think your County Council would object to submitting a scheme annually to the Board of Agriculture, indicating how you intended to provide for agriculture during the coming year, for advice and suggestions so as to systematise and organise the work?—No, I do not think it would.

11997. A suggestion has been made here that the agricultural education of that area marked blue on the plan there might be excellently provided for in the following way:—In your elementary schools you would give such a nature study as you can, and interest in rural and nature knowledge, and scholarships tenable at the Basing school, which is of an intermediate character, might be awarded by the different counties represented in that area: the best of the Basing students might proceed to Reading, which is a collegiate centre, and then the final object would be the university department of agriculture, when established at Oxford, where a degree in agriculture would be given. Under no conceivable modern conditions can individual counties provide each of those grades themselves?—No, certainly not.

11998. It can only be done by such a combination of counties as I suggest. Is that a plan which at a convenient moment you might consider and bring before your local authority? You see what I mean?—Yes, I quite see what you mean.

11999. In Berkshire you have got Reading: everybody cannot go to Reading, because you know the instruction there is above the requirements of the small farmer or the upper labourer: they want something much more like the instruction given at Basing. You might give a few scholarships tenable at Basing, which is in Hampshire. Hampshire sends some of its best scholars on to you at Reading, and Buckingham helps similarly. The very best of them would go to attain a university degree at Oxford; because the Reading people can only get a London degree if they want a degree. I invite your consideration of those matters, and possibly you may be able to bring them

forward at any agricultural committee of yours as a means of solving the financial and geographical difficulties?—I quite see what you mean.

12000. Will you kindly consider that?—I will certainly consider it, but of course I could not give you an answer now.

12001. (By Lord Barnard.) Assuming that any national organised system of agricultural higher education and instruction should be established, do you think that the county, or perhaps in some cases a group of counties, would be the best form of unit, or would you prefer larger areas. When I talk of a group of counties I am thinking in particular of Lincolnshire, where what appears on the map as one county is, for administrative purposes, three. The counties, or some such area of that kind would be a good local unit, and that the administration should not be in London, but should be local. Would you agree with that?—Of course, if anything of that sort was started, it is self-evident that the county could not run such a scheme as that by itself; no county could, except, perhaps, Yorkshire or Lincolnshire—large counties. It would be impossible for a county of the size of Berkshire to do it; no small county could do it by itself.

12002. You might do it in this way, if Buckinghamshire were to subsidise Reading to a certain extent on condition of sending so many pupils there free, and giving scholarships to so many more pupils who wanted such an education?—Reading has gone outside the County of Berkshire to do that to a certain extent. I mean they have some scholars from Dorset at the present time, and they have done a great deal of work for Dorset in the past.

12003. Any national system would, of course, entrust a certain amount of control and administration to counties, but counties should not, I suppose you will agree with me, be locked up in water-tight compartments?—Oh, no.

12004. If a national system were instituted there would be no reason why Gloucester, for example, should not send a suitable boy to Reading or to Newcastle?—No.

12005. You mentioned as a hardship that you had to send girls out of the county?—Formerly.

12006. It would not be an objection to a student to be sent out of a county if he got the education he wanted, and if the county paid for it?—No, but still it was a slur on our county when we instituted the scholarships for girls, that we had to go to a neighbouring county to help us out of our difficulty. Now we have established the girls' schools they are doing uncommonly well.

12007. On referring to the census of 1901 of males of 10 years and upwards, the number of people employed in agriculture in Berkshire, I see, are more than double that of those employed in any other industry. That indicates a preponderance of the agricultural industry, does it not?—If you take the villages round my part of the world they are as agricultural as any part of the county can be; there is nothing else carried on at all.

12008. Several witnesses have suggested, and we have had a great deal of conversation on the subject, the institution of a central body in London, perhaps a consultative or advisory committee connected with the Board of Agriculture, which should be, so to speak, the central exchange for all kinds of agricultural education work. Do you think such a thing would be feasible?—I should think it might; it would practically be the mouth-piece of the different counties.

12009. Yes, it would be something on the lines of the County Councils' Association?—Exactly.

12010. Are you a member of the County Councils' Association?—I was, but I could not attend to it. I had not the time, and so I could not go on with it.

12011. With the exception of subscriptions being authorised to be paid out of the county funds, it is purely a voluntary association, is it not?—Yes.

12012. It has been suggested to us that we should go a step further than that, that this body should be an authoritative body, a sort of assistant to the Government department, rather than as extending the scope of the analogous work done by the County Councils' Association. Do you think that would be an advisable thing?—I have not thought it over, but if you ask me to give an answer at once to the question, I should think it would be.

12013. Perhaps you will think that over?—Yes, but I should think it would be advisable.

Mr. C. J. DREWITT, called and examined.

Mr. C. J.
Drewitt.

27 June, 1907

12014. (*By Lord Barnard.*) You are a member of the West Sussex County Council?—Yes.

12015. Your Council has asked you to attend here in response to the invitation of this Committee to give us some information as to the line adopted by your county on the subject of agricultural instruction?—The Education Committee asked me to come here and confess our sins of omission, I think, more than anything else.

12016. West Sussex is practically in the same position as Berkshire with regard to its agricultural population, or was in 1901; that is to say those employed in agriculture are more than double the number of those employed in any other industry?—I was not aware of that.

12017. That is so. I suppose you will admit that West Sussex is to a great extent an agricultural district?—Yes, agricultural and residential as well. It has become very largely residential now with all these watering-places, and the building-out beyond the watering-places.

12018. In spite of that there is a very large number of people employed in agricultural pursuits in one way or another?—Yes, that get their living off the land.

12019. Are you a farmer yourself?—I am a tenant farmer.

12020. We have before us a publication, I do not know whether you are familiar with it, called the Annual Report on the Distribution of Grants for Agricultural Education and Research, which is published by the Board of Agriculture and Fisheries every year. It gives a list of every administrative county in England and under each head what is done in the way of agricultural education, and one reason why we asked you to come here to-day was because we observed in the case of your county that it was an absolute blank?—Quite blank.

12021. Have you ever done anything in the way of agricultural education and instruction?—Yes, in April, 1892, we started a travelling dairy school. That was fairly successful for a year or two. It was equipped for 10 students, and instruction was given in practical butter-making and in some kinds of cheese-making. The school travelled about from town to town. I may say there is no kind of cheese-making in Sussex at all. Eight schools were conducted at eight different centres.

12022. Do you know at all what it cost?—Perhaps I had better explain a little. This travelling dairy school was given up, after two years trial, in 1896 and transferred to a house at Worthing which was really set up for technical instruction for girls and young women. The dairy school was transferred there and made a permanent school, as it were. We only got 12 pupils and we spent £123 in teaching those 12 pupils at that centre.

12023. What happened to the house at Worthing. Is it still going on?—This house at Worthing after the 1902 Education Act came into force we were obliged to give up, owing to having to use the "whisky money" in providing for the pupil teacher centres and educating pupil teachers at different centres. The lady who conducted that school for us is now running the house and carrying it on on her own account.

12024. That looks as if there is some demand for such an institution?—She said she thought she could make it pay.

12025. What body in your county deals with agricultural matters such as the Diseases of Animals and the Fertilisers Act?—We have an Executive Committee for the Diseases of Animals.

12026. You are bound to under the Act, but does that committee consist of members of some other committee or is it a special committee?—It is a special committee with members chosen from different localities, so that each locality should be fairly represented on the committee.

12027. I find on reference to the previous reports similar to the one I have just referred to of the Board of Agriculture that in 1899 and 1900 you had some lectures in horticulture. Can you tell us why those were given up?—We carried them on till 1904 and 1905. The fact is we have been obliged to give up pretty well everything, even our evening classes, to provide for these pupil teachers' centres.

12028. Should I be right in saying that you began in a very small way and it has gradually vanished to nothing?—I think you would be right if you said that we spent nearly all our "whisky money" in trying to find pupils who wanted to be educated and in establishing these

classes, and they also started some of these amusement classes, as I call them. There were some art classes that did a certain amount of good, and some fretwork and wood-carving classes, and that sort of thing, that the ladies of the town used to attend for amusement more than anything else, and I consider it was a great waste of money.

12029. Have you ever taken any steps in the way of sending a deputation, or your Education Secretary, or anything in that way to see what was being done by other districts?—Not that I am aware of.

12030. You have received communications I dare say from the inspector of the Board of Agriculture asking you what you were doing in the way of agricultural education—perhaps that has never come before you personally?—No, the only thing I remember he came for was because some of our Committee wanted to go in for teaching something in the forest industry: there are a great many woods in the north part of Sussex, and they wanted to work up some classes for the hoop shaving.

12031. Surely you do not build such a high wall round yourselves in your county that you do not need or wish for further instruction?—I think we take the line that we have such a bump of obstinacy that we think we know enough and do not require any instruction: that seems to be the impression amongst the farmers and the County Councillors and those I associate with.

12032. Would you be surprised to hear that a similar feeling at one time existed in nearly every county in England with regard to agricultural education. We have had evidence from most of the counties now, and it is to the effect that that prejudice has almost entirely disappeared where systematic education in agriculture has been established: would you be surprised to hear that?—Judging of my own county I should, but not judging for myself.

12033. The evidence before us is that farmers have begun to appreciate very, very highly the assistance they have obtained in the practical carrying on of their business?—That has not reached Sussex yet: in fact, if you go and tell a Sussex farmer that you could teach him how to do things very much better than he is doing them, he would tell you that you know nothing at all about it.

12034. Are there many men employed in the woods?—In the winter time.

12035. Are they good woodmen?—Yes, that was the idea of starting these hoop-shaving classes.

12036. It is chiefly coppice work, I suppose—undergrowth?—Yes.

12037. At any rate that is an important industry?—Yes, I live in the south, but in the north of Sussex it is very important indeed.

12038. The supply of skilled workmen is rather diminishing?—Yes, the young men will not take it up. My idea is they do not care to work in the woods in the winter in the rough weather, and another thing is that the older men do not care to teach them.

12039. I suppose the attractions of the coast towns draw away a good many of the young men?—Yes.

12040. Have you difficulty in getting the skilled labour on your farms?—We draw a good many from Hampshire. The young men go into the towns and on to the railways and so on, and we recruit a great many from Hampshire and Dorsetshire.

12041. The farmers are all large and important people in West Sussex, are they not?—Yes, most of ours are considered large farmers.

12042. Where are their sons educated?—Do you mean as farmers?

12043. No: where do they get their general education?—Very widely—I was going to say all over the world. My own sons I sent to the Grammar School at Berkhamstead, and a great many of the Chichester boys have gone there.

12044. Where do they get their technical instruction?—On their fathers' farms: but I am sorry to say very few are taking farming up. Our farmers are being replenished from Devonshire mostly in my district. As the old farms are given up, the farms have not been taken up by Sussex men, and they are mostly taken up by Devonshire people.

12045. Is it not a fact that there is an enormous fruit and vegetable growing industry that has sprung up on the coast?—Yes—principally glass.

12046. That has to be conducted by skilled men?—Yes.

Mr. G. J.
Druitt.

27 June, 1907

12047. I wonder where those men are trained?—I do not know. Very few of our men have gone into the gardens, at least very few round Chichester where I live: in the Worthing district, I believe, a good many have gone into the gardens.

12048. Worthing is in your district?—Yes, it is only about 18 miles from me.

12049. There is no provision made in your district for those engaged in this industry, which is a growing industry?—We had classes for that sort of thing under the Technical Instruction Committee.

12050. Do you think the men engaged, say, in the woods in North Sussex or in farming in your own district, or in the glass fruit-growing industries round Worthing, might get, as people in similar industries have done in other parts of the country, instruction and scientific knowledge through the means of some of these colleges and institutions, which are marked on that map there, which would enable them to pursue their industry with considerable benefit to themselves?—I feel sure of it.

12051. (*By Lord Moreton.*) I am not, unfortunately, myself acquainted with West Sussex. Is the farming there of a high standard compared with other parts of England?—On the coast we are mixed farmers: further back on the downs we are flock farmers, and in the north, where the woods are, they are small farmers with quite a different class of farming—whether equally high-class farming or not I am not prepared to say.

12052. Is it your opinion with your experience of the district that those who are farming the land in Sussex are farming it so well that there is nothing for them to learn, and that they are getting the most out of the land?—They have not got so far yet as to know that they do not know anything at all about it: they want a little more knowledge before they will find out that they do not know anything: that is my idea of it.

12053. The Chairman drew your attention just now to what had been done in other counties, but I think he omitted to say that we have had evidence from a great many sources that in those places where the feeling on the part of the agriculturist has turned right round in favour of scientific teaching, it has been in those places where scientific teaching was started and carried on almost in opposition to the wishes of the farmers for some time. Of course you cannot expect people to realise the advantage of such teaching until it is brought before them?—I quite agree with that, and my opinion is that if we can only place an experimental farm in the middle of West Sussex where scientific teaching with experiments and all that sort of thing could be carried out so that the farmers could just go and see what was being done, then we should wake up: but I am afraid we shall have great difficulty in waking my brother farmers up unless we get something of that sort. We had an agricultural association at one time, and we tried to get agricultural lecturers down—Professors Lloyd and Long did come down and try to wake us up a bit, but the attendance was very bad indeed, and we were obliged to give it up.

12054. You think there is an urgent need that money should be spent on agricultural teaching in your district?—I do most distinctly; we want the science of agriculture brought before us more; we are all right at holding a plough, but what we want is for the young farmers to take up the scientific side, that is, as regards the application of artificial manures and the science of botany, the value of crossing different cereals, and the best grass with which to renovate your pastures for the butter-making and for the grazing stock. We want to be woke up in that way, in my opinion.

12055. The only way, you think, is by actual demonstration to the farmers?—Yes.

12056. (*By Mr. Acland.*) Before the Act of 1902 did you spend all your “whisky money” on education, or had you to apply for relief to the rates?—We used it all; but the way it was used I call waste of money.

12057. You used it all from the beginning?—Yes.

12058. As soon as the Act of 1902 was passed you found an extra strain on your funds, in that you had to provide centres for pupil teachers, and so on?—Yes, and it takes all our money now nearly. We get about £3,700, and it costs us over £3,000 for our pupil teachers: we used to get £4,200 at one time.

12059. So that, even if you saw your way quite clear to spending more money on agriculture, you would find it much more difficult to spare the money now than you would have done a few years ago?—Yes, unless the Government take up, as we consider they ought to do, the education of the teachers, we could not do it possibly.

12060. Is there any chance of your raising the rate for other than elementary education?—When we took to teaching the pupil teachers in centres we got behind, and after a great deal of pressure the County Council have allowed us to raise a penny rate, now we have got so far that we have brought out a scheme for the secondary schools in which the pupil teachers will receive their education, especially for girls in our county, and we are raising a penny rate now, and we have had plans got out for two secondary schools—one at Chichester and one at Worthing.

12061. So that if any additional aid took the form of helping those that help themselves, they would not find you unwilling to help yourselves?—I think not at all; I am sure the Education Committee would not be unwilling. The Education Committee is composed of so many members from the County Council and so many co-opted members, and when we speak of the County Council it does not quite mean the County Council—it means the Education Committee.

12062. Is there any large proportion of the Education Committee representing the rural districts in the county that is anxious to spend money in the way that you would like to spend it?—I am afraid not.

12062A. That has got to come?—That has got to come.

12063. (*By Mr. Latham.*) You made the remark just now that your agricultural population as regards masters was diminishing?—Yes, I should say considerably diminishing.

12064. And that you have had a very large invasion of men from Devonshire?—I will not say a large invasion; what I say is that the sons of the Sussex farmers do not take up with farming and their places have been filled considerably by an importation from Devonshire, and the rest of the farms have been taken up by amalgamating farms. My holding I have now used to be six or seven farms at one time.

12065. I suppose the farming interest in West Sussex has now got to be of much larger occupations than they used to be?—Yes, especially on the coast where I am.

12066. Are these Devonshire men quite satisfied to lie idle and not get any more information than you appear to want?—I take it so; we do not get any applications from them.

12067. There has been no offer made to them, has there?—Yes, in this way—perhaps I ought to have said before that we offered scholarships to the Agricultural College at Wye, and we only had one application, that was from a boy of 14 years of age, so we could not send him.

12068. I do not think you are likely to get any applications under your circumstances. How was the boy to get up to the standard of education necessary for Wye?—It was not offered to him.

12069. No, but these lads are not trained sufficiently to take an interest in the scholarships perhaps?—One would have thought their fathers would know it would be an advantage to them if they are going to be farmers to get a little scientific training.

12070. I take it from what you have told us that the interest in scientific training is absolutely nil in your county?—So far as I can see it is absolutely nil.

12071. How could you expect boys willing to take advantage of an agricultural scholarship to go to Wye when they virtually did not know what it meant?—I do not go quite so far as that, because most of the boys are able to read, and their parents are able to read and they must know about it.

12072. There is a little advantage in scientific knowledge, and, of course, when boys get home they think the best thing they can do is to run about the farm at home?—But, still, you would think the fathers would know there must be great benefit to their boys in after life if they have a scientific knowledge of farming.

12073. I take it from you the county generally has not got that idea?—I think they have not got that idea.

12074. For how many years did you offer these scholarships?—Only one.

12075. Then it was not very encouraging either to the schoolmaster or to the boy who took any interest in it if it died the first year simply because there was no application for them. Would not it have been much better for the interest generally even if they had not been taken up that they should have been continued for at least three years?—We wanted the money in other ways during those three years.

Mr. C. J.
Drewitt.
—
27 June, 1907
—

12076. You lost the interest in agriculture ?—We had felt the pulse and had found that there was no one who cared for these advantages, and we wanted the money in other ways, and we thought that it would be better to use it in other ways.

12077. Last year your "whisky money" was £4,149, and you have not given a fraction of it to agriculture, although I know very well agriculture is your only industry: the residential part affects those who actually live there. Is that state of things satisfactory to the agricultural ratepayer ?—That all this money should be given to other things and not agriculture ?

12078. Yes ?—Not at all.

12079. The agriculturists find a great part of the rates do they not ?—Certainly they do: a great deal of the money in Sussex comes from the agriculturist.

12080. If you allocated all this money to secondary education the urban people very much get the better of the rural people ?—Yes, very much indeed. According to my return here we had £3,817—that is what we received.

12081. In answer to Mr. Acland you said that you allocated the whole of your "whisky money" prior to 1902 to the benefit of agriculture ?—No, excuse me, to education. We only had the dairy school then and these bee-keeping and poultry classes that affected agriculture in any way, so that there was very little given to agriculture.

12082. Although you say you did not put the "whisky money" into agriculture, you put it somewhere that saved the rates ?—I do not put it in that way.

12083. Then will you be good enough to tell us how you do put it ?—There was so much "whisky money" given to our division of the county. The Technical Instruction Committee was appointed, and they had a free hand practically from the County Council to spend the money as they liked. They tried to do a little for agriculture, like those classes I have mentioned, but they found they did not get much encouragement there, and the remainder of the money they spent in the towns in what I call these amusement classes, such as fretwork and wood carving and those sort of things, and really the money was wasted in my opinion.

12084. You never took up horse shoeing ?—I am not quite sure whether we did or not. I know there was some talk about it. A neighbouring county did, and Sir Frederick Fitzwygram was very keen on it in Hampshire, and I rather think we did have a class or two in horse shoeing. We got him to help us to find a farriery place in which to teach these classes.

12085. Was it so unsuccessful that you could not manage beyond a class or two ?—I think, like other things, it died a natural death.

12086. Through lack of interest ?—Through lack of interest.

12087. Not that the smiths are so well instructed, or the horses so well shod that they could not be improved ?—No.

12088. Really there was a demand for the work if you had someone to supervise it and carry it on ?—No, there was no demand.

12089. I thought you said the horses were not so well shod, and the smiths could be improved: does not that mean that there is a demand ?—I mean a demand for the instruction. Of course those who had their horses shod wanted them shod as well as they could be, and they would have been glad if these smiths had been taught by a scientific man, but the smiths did not go in for it, and there was no one to encourage them.

12090. I take it, you, as an agriculturist, would be very pleased if you had your horses shod by scientific men ?—Well, as a matter of fact, we have got a very good smith indeed.

12091. You, as a thoroughly good farmer, may be quite satisfied with your own occupation and what lies around you, but at the present time, seeing others who are not so well off, you have not done anything to try and improve them ?—I was not on the Higher Education Committee—that is, the Technical Instruction Committee—and I had nothing to do with it. It seemed to me that the money they spent was a mere waste of money, and I kept out of it as far as I could.

12092. With regard to the farmers at large, you have said to a certain extent they are satisfied with themselves. Do not you think they would welcome anything in their midst in the way of improving their position ?—Not unless you could demonstrate it to them.

12093. Of course you could demonstrate to them and you could have experimental plots and that sort of thing, and research work, but you seem to me to be so exceedingly well off in Sussex that very little could be done to improve your position—is that so ?—I think a great deal might be done to improve our position, but the thing is to get a desire for the improvement.

12094. You made a remark that you had had Professor Lloyd and Mr. Long down to lecture, and that they were not very successful ?—Yes.

12095. May I ask you what they lectured on ?—Some of the lectures were on dairy work, and some were on the use of artificial manures, and subjects of that kind.

12096. Is there any very great demand for artificial manures in West Sussex ?—We use a great deal.

12097. Do you not ever make a mistake in applying the wrong manures on certain lands ?—I do not know that we have, but I admit that we have wasted a great deal of money perhaps in putting on the wrong quantities, if that is what you mean, but I do not know that we have injured our crops by it.

12098. There are certain lands that are benefited and certain lands that manures do a great deal of harm to. Are you so clever in Sussex that you know how to apply the different manures to the different soils ?—We do not. Phosphate, for instance, is one of the best manures that we can use. At one time I had a little farm on the chalk on the hill, and nitrogen was what was wanted there and not phosphate. There was enough phosphate in the land itself, but if we had used the same quantity of nitrogen down where I am that we used there we should have injured ourselves, but down where I live phosphate is the best and cheapest manure we can use. That is the sort of thing we have found out by experience, but we have had to grope about and find it out, and if we had this experimental farm we could go and get information like that almost at once.

12099. Even at your age you would welcome an experimental farm to try and teach the junior agriculturists in West Sussex ?—Yes, and myself as well.

12100. There is no such feeling against this teaching in the county as there is against the lack of teaching ?—I am not so sure about that. I will not say against the teaching, but there is not the want felt for the teaching, if you can understand me—they do not feel the want of teaching.

12101. I suppose now and again you have been to the Royal Agricultural Society's shows ?—Yes, many times.

12102. Have you ever been to see their Scientific Exhibition, the Agricultural Education Exhibition, as it is called, where they show what an enormous amount of harm artificial manures may do if applied to the wrong soils, or in too great quantities ?—I do not think I have ever seen that.

12103. In that exhibition it is shown that very often artificial manures have almost ruined the land when they have been wrongly applied ?—I am sorry to say I have not seen that exhibition.

12104. It is so, and sometimes where there has been too much manure of one sort used ?—I have learnt a great deal from these sort of exhibitions, and I think they are educational, and are exceedingly good for instructing the younger agriculturists.

12105. Do you think your young men would not care for an exhibition of that kind ?—I think they would when they saw it.

12106. But unfortunately they never see such exhibitions ?—They never see such things, and that is what I say, that if we had an experimental farm set down in our centre they would be able to see the things themselves, and one would tell another and get them to go and see it, and a desire for more information and knowledge on these subjects would be spread in that way. That appears to me to be the great want with regard to agricultural instruction in our district.

12107. This Committee may take it for granted that you would welcome in West Sussex an experimental farm on such a basis as the Hampshire experimental farm ?—I do not know the Hampshire experimental farm; in fact, I do not think I have ever seen an experimental farm.

12108. I do not wish to assert that you have not been a great traveller, but a great many of these Devonshire men do get about the country a great deal and are very energetic men. Do you not think they would care for something of that sort ?—I should think they would,

because they seem very businesslike men, and they certainly try to be up-to-date, and I think are very much in front of our Sussex farmers on the whole, I am afraid.

12109. You know the terms of the reference to our Committee?—I have seen them.

12110. It is with a desire to improve the agricultural education in the country that we are sitting here, and if there was any more money allocated to the councils for agricultural education would your county welcome a portion of it?—Most certainly they would, but I think it should be allocated to agriculture and not to general things.

12111. We are sitting to deal with agricultural subjects only, and if we could get a certain amount of money allocated to agricultural teaching in your county do you think your county would feel disposed to pay a portion of their money towards it?—I should say so, most certainly.

12112. There is not such a very great feeling in the county that no money should go to agriculture, is there?—No, I do not think there is. There is a strong feeling in the Education Committee that it is really hopeless to teach us agriculture, but if it was once shown that we could be taught I think they would be very pleased to give some of the money towards it.

12113. You spoke of Wye just now. Do not any of your people in the county make visits there?—I have never heard of any of our farmers going there.

12114. It is not so very far off you, is it?—Yes, it is some distance, and it is not only a question of distance, but the difficulty of getting there: the rail communication is bad, and I do not know of anyone in West Sussex having gone. I know an East Sussex man who sent his son there.

12115. Is yours a dairy county?—No, I do not think it could be called a dairy county: ours is more mixed. As I say, in one district they are mixed farmers, and in another you get the flock farmers, and then on the clay land you have the smaller farmers.

12116. You have a very large quantity of downs?—Yes, and there are many flocks of South Down sheep in the county.

12117. So that really we may take it West Sussex is not an experimental county at all?—I should not think so: the dairy business is principally the milk business for the south coast towns.

12118. (*By Professor Middleton.*) I gather from your evidence that the county of West Sussex does spend upon and must take a very considerable amount of interest in higher education, because you spend your "whisky money" which is nearly £4,000, and you are levying in addition a penny rate, which will bring you in nearly £3,000?—Yes.

12119. So that you will have about £7,000 to spend on higher education?—Our chairman, Mr. Hubbard, is very interested in the higher education, and does all he possibly can to work us up to it.

12120. You will spend between £7,000 and £8,000 on higher education?—I do not think we spend as much as that. I may explain that the first penny rate we made was because we had got behind with these classes, owing to the teaching at the pupil teachers' centres, and we had nearly all that penny rate to pay to that fund in order to meet the deficiency, and now we are bringing out a scheme for these secondary schools, and of course we cannot build them and carry them on with the "whisky money," and we are still obliged to have the penny rate.

12121. You mentioned the fact that your chairman was greatly interested in secondary education?—Yes, and elementary, both.

12122. It rather looks to me as if those who were running your Education Committee were not agriculturists. We will not say anything about the present, but in the early days, when you had your Technical Instruction Committee, there cannot have been any strong agricultural representation upon it?—No, I think the agricultural members kept off, like I did myself. We were very much disgusted at the way they spent the "whisky money."

12123. The secretary for technical instruction was perhaps not interested in agriculture. In most of the counties the secretaries have made it their business to develop some particular scheme, or, at any rate, the chairman and secretary together have prepared schemes?—I think he was more interested in these art schools and what I call amusement classes and that sort of thing.

12124. I fancy we can explain the position in West Sussex by these facts, that the agriculturist himself did not take any interest in the question, and that those who were responsible for seeing to his education did not offer, or, at

least, did not make any very definite offers?—We did not certainly succeed in stirring them up.

12125. There was no attempt at organised agricultural education?—Not the least, as far as I know. The thing was allowed to sleep.

12126. Since the Education Act of 1902 has come into force the money has disappeared, but at the same time we have got it now laid down by law that the local education committee must consider the educational needs of the district, and one would hope that your educational authority would definitely take cognisance of the needs of agriculture and attempt to push the subject of agricultural education to some extent. Do you think there is any prospect of that?—I do not think there is the slightest prospect all the time we have these pupil teachers to provide for: it has gone so much against us that we think we have got as much as we possibly can do to provide for them.

12127. In that case, the educational needs of your area may be interpreted to mean the training of pupil teachers?—As we see them. We do as much as we are obliged to do and no more, as it seems to me.

12128. You have thought over this subject I can see very well from your evidence, and you recognise the fact that if you want to teach the farmer you must demonstrate to him?—You must demonstrate to him until you arouse the interest.

12129. You think in the early days if there had been some scheme by which experimental farms or demonstration plots had been founded in the county, and if they had been well conducted that by this time agricultural education in your county would be appreciated and on a sound basis?—I quite think so. If you had plots showing the different effects of phosphate and nitrogen and sulphate of ammonia when applied in different parts of the county and on different soils they would have taken it up: and not only that, but if they had gone further into botany and into experiments in the crossing of cereals, and as to the best grasses for pastures, and that sort of thing, it would have been a success if we could only have been set thinking in the first place: but we have not got as far as that yet—we have not begun to think.

12130. From your evidence it is quite clear that the requirements of the soils of south Sussex must be very dissimilar from those in the northern part of the county?—Very dissimilar. There is great benefit in using basic slag on the clay in the northern part, and if they were to use that they would get a wonderful result. If they were to take a spot about the centre of the county for an experimental farm they would get nearly all the different classes of soil there.

12131. But unfortunately there was no one to organise and lay them out?—No, there is no one to set us thinking: that is really what it comes to. When the college at Wye was established, I believe it was mooted whether we should not join them, and the Duke of Richmond called several of us together to go into the subject, and it was talked over, and we asked then what our interest would be if we were to provide a certain sum of money, and they said we should have an interest in two and a half pupils in Wye College. We did not think it was worth going into for the sake of two and a half pupils, and so nothing was done.

12132. If you had joined with them they would have done all the work that you have been speaking of, the demonstration plots and so on?—Probably it would have been to our advantage if we had joined them at the time.

12133. (*By Mr. Medd.*) There was a particular reason for West Sussex not co-operating with East Sussex in the maintenance of Uckfield?—Yes, and that is the principal reason, I think, why the sum of money they asked us to provide would only give us the share of two and a half pupils. I know I suggested to several landowners, "If you will put down one shilling an acre yourselves, you can do very much more for us," but they said they did not see why they should do it.

12134. Do you feel you are absorbing the whole of your higher education money satisfactorily? Do you use any of the elementary education money for agricultural purposes at all?—Only for gardening classes at the schools: we have been at that for a twelvemonth or two years, and we are working those up.

12135. You have nothing in the nature of a higher elementary school?—Not in our district at all.

12136. If you find that all your available funds for higher education are absorbed, you might draw upon your elementary education funds to start a higher elementary school at some suitable centre, which would serve all your purposes

Mr. C. J.
Drewitt.

27, June, 1907

Mr. C. J.
Drewitt.

27 June, 1907

agriculturally, and not affect your present allocation of money. You had not thought of that, had you?—No.

12137. That is a method which you could satisfactorily adopt in West Sussex without identifying yourselves with Wye or with Uckfield, and you could do it either by the development of a village school or by the erection of a separate institution. You do already teach gardening at some of the village schools?—Yes.

12138. How do you get those teachers trained?—I think in almost every case our teachers have been practical market gardeners.

12139. Not the schoolmasters?—No; but I believe some of the schoolmasters are qualifying this year, and I think some of them are teaching now.

12140. You are building a hostel in connection with the Brighton Diocesan Training College, are you not?—No; there is a scheme on, but whether it will come to anything I do not know: we have been asked to join in it.

12141. Would you endeavour in any further developments at Brighton or elsewhere for the training of teachers, to provide classes for them to obtain adequate instruction bearing upon rural subjects?—Do you mean at the Brighton College, or in our own district?

12142. Wherever it may be. As you have said again and again, this question of pupil teachers and their training is taking all your money, and all I ask is, occupying the position which you do in West Sussex, will you use your influence to get at each place, to which you may have to send teachers to be trained, classes for instruction bearing upon rural subjects?—I would with regard to agriculture, most certainly.

12143. You will?—I would do anything I possibly could to forward instruction in agriculture.

12144. You know far better than I do with regard to agricultural education that all village interest depends upon what is taught at the village schools, and if you have to get a good labourer you must have him taught to use his hands and his eyes as much as to use his brains: do you agree with me?—I do not quite—I think these boys are too young.

12145. I do not mean that they are to be taught agriculture. I mean to be taught to use their hands and their eyes and their brains?—I do not quite agree with you there, unless there is a special class for it. The Act says he is to pass a certain standard before he can leave school, and I do not think you ought to multiply what they are already being taught, because I think it would be very hard to keep a child at school longer than is absolutely necessary when his parents may be very, very poor, and would be deprived of his wages for that extra period.

12146. This does not require the introduction of any new subject or mean keeping the child at school any longer?—Then you must teach it out of school hours.

12147. No; you must alter your methods of instruction; that is all. What I mean is, you should base your lessons in reading, writing, composition, and so on, on rural subjects?—I may say my committee is in favour of that, but I am personally against it. I feel we ought to have these children taught up to their leaving standard and get them through as soon as we possibly can, unless the parents wish them to stay longer.

12148. My suggestion does not affect the age at which they leave school?—But if they are learning agriculture, and these other things, surely it must?

12149. No, it cannot be called agriculture; they begin at five years old, and it is merely a question of teaching them to use their hands and their eyes, as well as to use their brains, and to base their lessons on rural subjects?—They are multiplying the subjects in the schools, in my opinion, now a great deal more than is necessary, but if you mean it is only to educate the mind, I am with you, because my opinion is that the education that is given in the schools at the present day is more an education of memory and not of mind. They have to learn all these different things from memory that they are taught now, and then they leave school and perhaps go to the plough-tail and forget it all in a very short time, and I think it is very little good; but any education of the mind that they can be given I am entirely for.

12150. We are quite at one, and that is what I want you to use your influence for—that every one of these pupil teachers shall have an opportunity of learning how to use nature as the subject of instruction in school?—I should always be in favour of that—anything to expand their minds. I consider our educational system now is merely

an education of memory, to a great extent, and I do not believe in it.

12151. Following that out, if you were to take up my suggestion of a higher elementary school devoted mainly to commerce and agriculture, you would find that it would not trespass upon your existing funds and that you would be meeting the pressing requirements of the county in respect of agricultural education?—We do do that in a way with our scholarships, by sending some of the boys to the better class schools at Portsmouth and one or two other places where they are established. We have not any in our district.

12152. The agricultural population in the rural district should have their interests attended to?—I am not sure whether you are referring to those who are to be masters in agriculture or workers in agriculture, or whether you are referring to both.

12152A. In my references to the elementary schools I am considering the future labourer, and in my references to the higher elementary schools I am considering the sons of the small farmer. Here are you, avowedly an agricultural county, quite ready to provide every kind of instruction for everybody engaged in industrial occupations except agriculture?—Yes, everything except agriculture.

12153. (By Lord Barnard.) You have heard of the great deal that is done in British colonies and other countries for agricultural education in the way of obtaining and disseminating information for the benefit of farmers?—Do you mean information distributed from an official source?

12154. Yes.—No, I do not think I know that.

12155. Particularly in Canada that is the practice?—I did not know that; I know that they have experimental farms and that kind of thing.

12156. You are aware of the existence of the Board of Agriculture leaflets?—Yes, quite.

12157. Do not you consider that they are of use?—I am afraid I have not found them a great deal of use.

12158. Perhaps you have not studied them very carefully?—We had an outbreak of anthrax amongst pigs once and did the best we could with it, and wrote to the Board of Agriculture and asked them for advice. They sent an inspector down, who came with a big bundle of leaflets under his arm, and after inspecting the animals he said he did not think we could do anything more than we had done.

12159. Is not the Board of Agriculture the servant of the public?—Quite.

12160. And not the master?—Quite so.

12161. There is a college called the Harper-Adams College in Shropshire, which is one of the type we have been talking about to-day. I should like to read you a note I received this morning from my agent with regard to a visit of a number of agriculturists to that college. He says that on August 8th, 1906, 19 of my tenants paid a visit there, and they took a keen interest in everything there was to see and hear, and that they had a large appreciation of the opportunity given them of paying that visit, and that the time had now come for arranging for further parties to be taken, and might he take another party this year; and the agent adds that he thinks it would be desirable. Do you think if parties of your people were taken to see some of these colleges it would be an advantage?—Yes, I think it would do a great deal of good.

12162. You recognise the importance of scientific knowledge with regard to the use and the application of manures and things of that kind?—I do.

12163. That scientific knowledge can only be disseminated by trained persons?—That is so.

12164. Where are those persons to be trained; surely the administrative county of West Sussex is as much interested in securing good training for these men as any other county in England?—Yes.

12165. Would it not be a good thing if you and your friends and neighbours could arouse interest in such a thing as that?—Yes, it would be a very good thing, but I should not like to undertake it myself, knowing the material I have to deal with.

12166. Do not the local newspapers contain paragraphs—they do in most of the districts with which I am associated—discussing these subjects; paragraphs and very often articles relating to agriculture?—In my experience there have been more on the principles of gardening, not on

what I should call the larger operations or scientific matters. Of course we have an agricultural paper and we get all that kind of thing in that.

12167. You must know what is going on in the outside world?—I get a great deal of information from my agricultural paper, certainly.

12168. Have you heard of the Agricultural Correspondents of the Board of Agriculture?—Yes, my son is one for our district.

12169. Is that system worked for all it is worth in your county; is there much correspondence going backwards and forwards between the correspondent and the Board?—He says there is a good deal that comes, but I doubt whether there is a good deal that goes.

12170. Your county did not appear to have much knowledge that this enquiry was being held here?—I do not think so; I had not personally.

12171. I am told that every county was officially notified of it, and it is somewhat to be regretted, in my opinion, that an agricultural county like yours was not notified by your clerk of the fact that the Committee was sitting. I have had put into my hands rather an amusing newspaper extract which perhaps explains it. I see at a meeting, I suppose of your council, at which you were appointed to come here (for which we are very much

obliged), the report says you have come "to explain why West Sussex had done so little for agricultural education. It was explained that the task would not be an onerous one, and Mr. Drewitt said he thought he could tell the Commission in a very few words what he thought the Government should do"—My idea is that we should work right up, that we should have an experimental farm with scientific teaching to which we could send our sons, in each county area and then work up to these higher colleges. We want demonstration brought before the farmers. My idea is we should send them just for winter sessions, so that they may be able to come back on the farms during the summer, and if there are any that show they require more scientific knowledge let them work up to these higher colleges and take full instruction there.

12172. Would you agree with what a witness said this morning, that it is now the duty of the Government to direct and stimulate agricultural education?—I thoroughly agree with that. I think it means millions to our country. Every extra quarter of wheat that you can produce in this country by means of science adds very much to the wealth of the country; it circulates in the country and it must do good.

12173. The result must to a certain extent depend on how the county authorities respond to such direction and stimulation?—I think each county would certainly try and do its part.

Mr. C. J.
Drewitt.

27 June, 1907.

TWENTY-FOURTH DAY.

Tuesday, 2nd July, 1907.

PRESENT:

The Lord BARNARD (*in the Chair*).

Mr. DAVID DAVIES, M.P.

Mr. THOS. LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. J. W. SMITH called and examined.

12174. (*By Lord Barnard.*) You are a member of the Herefordshire County Council?—I am.

12175. Are you a member of the Education Committee of that County Council?—Yes.

12176. You are by business a farmer in Herefordshire?—Yes.

12177. And have been for a good many years?—All my life.

12178. You have an Agricultural Sub-Committee of the Education Committee?—Yes.

12179. You are Chairman of that Committee?—I am.

12180. Does that Committee consist of men who are interested in the land mostly?—Yes, they are all interested in the land—they are members of the Education Committee; the Agricultural Committee is a Sub-Committee of the Education Committee.

12181. Does that Sub-Committee create much interest amongst its members; do they take an interest in its proceedings?—There is an increased interest taken in it.

12182. What actually are its duties?—To superintend the agricultural education of the county; they spend about £1,200 annually.

12183. Would you briefly tell us how that expenditure is allocated. I see in the Government Report it says £450 on general expenditure, which is principally agricultural lectures. What are the operations of your Sub-Committee?—A permanent staff is maintained consisting of an agricultural instructor and organiser, who is in charge of the work, a gardening and fruit culture instructor and a dairy instructress; other instructors in veterinary hygiene, poultry keeping and bee management, cider making, and various agricultural processes, such as ploughing, hedging, sheep shearing, &c. These latter are employed part of their time only.

12184. Your lecturer in agriculture is a Bachelor of Science?—Yes.

12185. So that he is a highly-trained man probably?—He is.

12186. Are you extending or restricting this work of agricultural education?—We are slightly extending it year by year.

12187. Do you find any difficulty in getting the necessary funds from the county authority?—No; the county authority have really given us permission to go as far as £1,800, but we have only spent £1,200 up to the present.

Mr. J. W.
Smith.

2 July, 1907.

Mr. J. W.
Smith.

2 July, 1907.

12188. That, I suppose, is because you are going cautiously?—We are going cautiously.

12189. How long has this work been going on in the county?—I suppose about three years really—the present work.

12190. Practically you are only beginning?—It began some ten years ago, but it had almost collapsed, one might say, until we made a fresh start.

12191. What is your opinion of the practical value of such work?—I believe it is very successful, and I think it is doing great good to the young agriculturists of the county. It is giving much information and education, and it is the sort of information and education that I think the farmers require.

12192. Do you encourage farmers to make enquiries of you when they meet with difficulties, such as manures not having the expected effect and that sort of thing?—Our organiser is always open to give advice, and I believe he has many hundreds of enquiries during the course of the year.

12193. Do farmers come to him?—Yes.

12194. You make a note here, and it is a piece of information which we have had from most witnesses, that a certain amount of prejudice existed in the past against the work?—Yes.

12195. What is the present attitude of the farmers with regard to it?—I think that is gradually going away.

12196. You are of opinion, then, that if the work is persevered in by your Committee it will steadily become more useful and more and more appreciated?—That is my opinion.

12197. The instructors, as you say, go about a great deal and give advice. Do you issue any leaflets or bulletins?—Yes.

12198. You receive no aid from the Government?—None whatever, I think.

12199. All the funds are provided by the county?—I think we have some small grants for dairying and one or two other things, amounting to about £60 a year.

12200. At the present moment, speaking financially, you are not actually in need of funds?—No.

12201. Does your Committee contemplate a great extension of this work in the future?—I do not think they contemplate it from the county funds, but they all feel that there is a considerable field for further agricultural research and experiment which might well be conducted, but not by our county authority.

12202. You are aware that a good deal is done in that direction already in many places in the country?—Yes, but nothing is done in our county; there is not a single recorded experiment for a student's use, I believe.

12203. I hope you would not suggest that each county should lock its experiments up in its own bosom and not allow its neighbours to get any benefit out of them?—No, but I do hold that experiments carried out in a different county under different conditions, and on different soil and with a different climate, are no certain guide for our county to go by.

12204. Quite so, but your county would be different from other counties with which we have had to deal if one set of experiments would be sufficient. Does not the soil in your county vary considerably in different parts?—It does vary, but not to the extent that it would vary compared with soil on the other side of England.

12205. Have you ever considered whether experiments of the nature of which you have just been speaking might be carried on as part of a national system?—I do think so.

12206. What I wish to convey is, supposing it were found practicable to control and direct, not to carry out, but to organise and direct experiments of this character all throughout the country by a central department in London, say the Board of Agriculture, and to make the results of those experiments national property and circulate them for what they are worth amongst the different districts. Do you think that would be a good plan?—I think so; I think there should be one central authority to control, but it should have its stations at different places.

12207. Are you well off for secondary schools?—No, we have no secondary schools under the County Council.

12208. Have you no old grammar schools?—We have schools which might be called secondary schools, but they are not subsidised in any cases.

12209. You have some endowments?—We have some

endowments, but they are not specially used for agricultural purposes.

12210. When you speak of secondary schools, would you have secondary schools for agricultural purposes only?—I believe the secondary schools which are contemplated in our district will be schools that will give an education which will fit what you may call the needs of the working farmer class of the county.

12211. I do not know whether you have thought of what the result of such an arrangement would be. If secondary schools were established for agricultural education only, every industry would have to have its own special secondary schools.—I did not mean that they should have a separate agricultural education; I mean that they would have an improved education which would fit them for that particular work, a general education which they would have at a cheaper rate than they have at the present time.

12212. It is your opinion, in other words, that the young farmer ought to have a good general secondary education, which would enable him to take advantage of scientific knowledge afterwards?—Yes, up to a certain age.

12213. Would you suggest an age?—Yes; I think that the ordinary working farmer cannot afford to allow his boys to stay at school longer than 15, nor do I think it is of advantage to them to do so in their particular profession.

12214. You would not go as far as 16?—I would not limit it particularly to one year, but my own experience is, and I have had considerable experience with pupils, that if they are at school till 18 or 19, or at college, you cannot readily bring them back to do the details of their work; they learn the heads of their subject, but not the working detail.

12215. A suggestion has been laid before this Committee by many witnesses that after the future farmer has had a good secondary education at a secondary school, he should go and have practical experience for at least two years on a farm?—That is my opinion.

12216. And that then perhaps some of the more brilliant and intelligent lads might be disposed to go in for, say, a six weeks' agricultural course in winter, so as to learn a little agricultural science?—Yes; whether they are dull or whether they are brilliant, I think that would be a good thing for them.

12217. And perhaps here and there a specially brilliant boy might want to go to a university college and get a degree in agriculture?—Yes.

12218. That, of course, would not apply to the rank and file. Do you not think when a brilliant boy does appear on the scene, and such always do from time to time, that he should have an opportunity of further extending his own knowledge for the benefit, practically it comes to, of the whole agricultural community?—Yes, I certainly do think so.

12219. You are not satisfied, I see from your notes, with the education given in the elementary schools, particularly towards the close of the child's career?—No; I am not altogether satisfied with it.

12220. Of course, I am speaking only of agricultural schools; I am not talking of schools in towns so much?—My experience has rather been that there is a certain fixed curriculum for all elementary schools both in town and country. I maintain that the subjects taught in the country schools should be not altogether suitable for both the country and the town, that they might vary, and that we should have a training somewhat different for country boys, particularly in such subjects as gardening and some little botany and other similar things.

12221. Is nothing done in that respect in your county at present?—Very little, and, until lately, nothing whatever.

12222. It is beginning?—It is beginning.

12223. Possibly, when public opinion gets created, it will extend?—Yes; I am confident it will.

12224. (*By Mr. Medd.*) You know Lord Scudamore's school at Hereford?—Yes.

12225. They are doing good work there, are they not?—I think they are.

12226. (*By Lord Barnard.*) Do you not think a difficulty would arise in consequence of the fact that in a very great number of cases elementary schools serve both rural and urban, and what you might call semi-urban schools?—There could be very little doubt, at least in our county, as to what is a rural school and what is an urban school.

Mr. J. W.
Smith.

2 July, 1907.

12227. You have no large towns in Herefordshire?—No; Hereford is the largest; the school there might be called an urban school.

12228. You have no great industries, practically nothing but the cultivation of the land?—Nothing else whatever.

12229. Have you any large areas of woods?—No; there are some good woods.

12230. You have not mentioned the subject of labourers. I suppose, from what you have stated about the rural elementary schools, they are principally for the education of the farm labourers' children?—Principally.

12231. Both boys and girls?—Yes.

12232. I do not know whether dairying is carried on largely or not in Herefordshire?—No, there is not much dairying.

12233. Then I will not trouble you with questions about dairying if there is not much done in the county, and the same as to woodmen, if it is not a great industry. Is there anything more you would like to state to the Committee?—I do not know of anything particularly; I have attended by request to answer any questions you might like to ask me.

12234. (*By Professor Middleton.*) You lay great stress. I see in your evidence, on the necessity for experimental farms being established in counties?—Yes, for experiment and research in particular subjects.

12235. You say: "I hold that every agricultural county should have a station for experiments and research"?—Yes.

12236. You think that is really a matter which it is the duty of the State to undertake?—I do; I feel myself, from my own experience, that probably the experiments that have been carried on, for instance, at Rothamsted, have been of more value to us as agriculturists than all the science that has been taught anywhere at the schools, and if there was in each county a station where research could be carried on by thoroughly well qualified men, whom there was no doubt about, to confirm such experiments as there were at Rothamsted, and to conduct other experiments, it would be of the greatest value to young students of farming now, and you might say for all future time. It is really a national matter.

12237. We, of course, quite agree with you as to its value; but have you thought of the cost such a scheme would entail? You know the endowment that Rothamsted had. Sir John Lawes left £100,000 for that station, and we understand that even that sum is not sufficient, so that you might calculate for a station similar to Rothamsted you would want an income which would mean a capital outlay of something like £100,000 to £150,000?—No; I did not contemplate anything of that sort; I rather contemplated a station which would confirm such experiments as at Rothamsted in our particular county, and to conduct other experiments for our special industries, such as fruit growing and hop growing.

12238. A subsidiary station?—Yes.

12239. Have you not come across such subsidiary stations in the counties with which you are acquainted?—Not a station which, so far as my opinion goes, can be thoroughly relied upon.

12240. You have not been in any of the eastern counties, East Suffolk, for example, and seen their station?—No, but supposing I had been there and had seen their station, I should scarcely have expected to find that any experiments carried on there would have confirmed anything that had been done in our county. Of course, they might confirm it in a sense, but I mean as a matter of positive instruction.

12241. That is not my point. My point is that there are counties in England which are conducting experimental stations such as you indicate, and doing it for themselves, and East Suffolk is one of them?—If they are doing it in a thoroughly dependable manner, but to my mind it is vastly important that it should be done by men who are most qualified for the work, so that there should be no mistake about it.

12242. As a matter of fact, the particular station to which I referred is most carefully conducted: they have a thoroughly competent and reliable young farmer in charge locally, and there is a committee also which supervises all the work and everything that is done there, and the figures derived from that station are as reliable as you will get from Rothamsted. The point is that there are counties in England which do conduct stations

such as you indicate. You think that would be desirable in the county of Hereford?—Yes; but not at the cost or under the control of the county committees.

12243. You have referred, of course, to the need for local experiments, and you have said that it is a question of soil and climate, and you want experiments for the county of Herefordshire itself?—Yes, for our special industries.

12244. Is there not something else which makes a local experimental station desirable? Is it not very necessary that you should have something which the agriculturists of Hereford could see and visit?—Undoubtedly; that would increase its value perhaps by half.

12245. Would you not agree with me that the chief value of the local station is that it is open to the inspection of the local agriculturist?—Yes, that is one of its values.

12246. So that it raises his interest in the work and induces him to follow the results?—Yes, to take the case of a young Herefordshire farmer, there is no record of experiments, so far as I know, in our county to which he can look for reference; there is no guide book to give him the slightest instruction. He has merely to follow what his father can teach him, or what he learns from his neighbours; that is the extent of his knowledge.

12247. I quite agree it is very desirable to have these facts recorded locally. I only want to point out that one of the chief reasons for the local experimental station is to stir up local interest?—Yes, that is one reason certainly.

12248. In connection with the education of the young farmer, you complained of pupils who had been at colleges and who had continued their education there up to the age of 19 or 20, and you said that they would not go into the details of farm work afterwards. What exactly do you mean by that?—I mean they never come down to the detail work. It is of no interest to them to do what may be called the ground work, the elementary part of their work, the cultivation of the soil. They know the heads of their subjects, but they do not know the bottoms, and it is the details that may make the difference between a profit and a loss to the farmer.

12249. You are a great advocate of the farmer beginning young?—Certainly I am; I think if he is at school after 14 or 15 he is wasting time.

12250. Supposing the class to which Lord Barnard alluded existed in your county: that is to say, the clever lad whom you wanted to send on to the University to get a thorough agricultural education, would you have him go on to the land first and then go to the University afterwards?—If he is to be a practical farmer, to make a profit out of his farm ultimately, I should.

12251. You spoke of having had experience of pupils yourself?—Yes.

12252. That means farm pupils, I suppose?—Yes.

12253. How many do you take at a time?—Never more than two; still, I have been having these pupils for 30 years, so that I have had a good deal of experience in that respect.

12254. How do these young men turn out as farmers, if it is a fair question—how are you satisfied with them?—As a rule, the highly-educated collegiate ultimately leaves farming for some other occupation; he becomes a land agent, or emigrates; he is seldom sufficiently interested in farming, nor is it worth his while to continue it as an occupation for the purpose of making money.

12255. (*By Mr. Medd.*) Has it not been your experience and that of other farmers that the man who goes to the advanced college rarely intends to farm himself, that he takes up an occupation connected with farming, but does not become himself an actual farmer?—I believe he finds out in the long run that the occupation does not suit him, and therefore he adopts some other profession.

12256. As a matter of fact, from your experience the majority of men who receive the advanced training at a collegiate centre do not themselves farm?—They may farm, but they have assistants under them who do the details of their work.

12257. They are sufficiently well off to employ labour to do the work?—Quite so, they are not dependent upon farming as an occupation for a livelihood.

12258. Professor Middleton spoke of East Suffolk. I notice that their total allocation to agriculture is £475. Yours, I understood from what you said to Lord Barnard,

Mr. J. W.
Smith.

2 July, 1907.

was anything up to £1,800?—Yes, but that includes horticulture and various other branches.

12259. Yes, they do in the case of all these others. You have not spent the £1,800 yet?—No.

12260. There must be a great deal of miscellaneous work going on in Hereford to account for the very large expenditure?—Yes.

12261. Because it is large relatively?—Yes.

12262. What are the ways in which you spend your money?—Would you mind asking our secretary those particular questions, because he can answer them more readily than I can.

12263. Very well. One feels very often that a great amount of the money expended, as it were, upon agriculture, is expended upon the staff?—Yes.

12264. The administration, in other words, costs relatively far more than the actual work done?—There is very little work done except in teaching.

12265. You spoke of the defects in the elementary schools—that they do not, in other words, correspond to the requirements of agricultural people?—Yes.

12266. How would you differentiate them—what would you do to alter them?—The complaint I make is that there is nothing done, or little done in our elementary schools to interest the scholars in rural occupations or in rural life of any sort, and I think they might have lessons in various rural subjects.

12267. You come to this Committee and rightly make that complaint, but neither the Board of Education nor this Committee can help you. You have it in your own power to reconstruct the whole curriculum of any village school so as to bring it into the closest correspondence with rural needs?—I suppose we have.

12268. You have.—But still I am pointing out a defect in our present and our past education.

12269. No one could be more conscious of it than I am, but it only requires, I am convinced, a little organisation, a little effort, and the impression made on the neighbourhood is enormous. I will go further, I will tell you that the child educated on those lines is far more full of intelligence and adaptability when he comes into a town.—I quite agree with you.

12270. You agree with me in that, and you agree with me in what are the requirements. Now, occupying the position which you do in Hereford, I wish you would try and get their schools more modelled on what you and I feel to be their requirements. You told me you thought Lord Seudamore's school at Hereford is running on right lines?—Yes, I have heard so: I have not seen the school.

12271. I have heard excellent reports of it, I have never seen the school either, because it is rather out of my way. There is excellent work done there?—I believe there is.

12272. You want to go a little beyond the elementary school, in other words, you want to take those lads that are capable a stage higher? Have you ever heard of or met with any higher elementary schools?—I do not think we have any.

12273. No, there are none in England, but if you were to enquire from the people who have seen them, I think you would find that they are just what you want in rural districts. They take the child up to 15—that was the age you named—and during the last year or two years, he is engaged in some form of industry or in commerce or in agriculture: that is from the age of 13 to 15, and the others have general education and become clerks, but, as you and I know, the clerk who has been taught to use his hands and his eyes, and to observe, is a better clerk than the one who has only had to learn things out of books; is not that so?—I think so.

12274. Now we are quite agreed that you want something a little bit higher than that for those that are cleverer and whose parents can afford to let them remain at school until the age of 16 or 17. You have not a school of that type?—No, I do not think we have.

12275. There is no school of that type nearer to you than Dauntsey, in Wiltshire. Have you seen that school?—No, I have never seen it.

12276. It is excellently equipped, and it just takes a lad who can go from 13 to 16. Then you want for your man who gets to the top a collegiate centre, that is for the few who can go on to the most advanced posts in agriculture—men who will occupy posts, eventually, like those occupied, I may say, by Professor Middleton or Major Craigie, or Dr. Somerville. Those are the men who become the heads,

and very few have the opportunities of reaching those posts. Within your district there is no other institution beyond Cirencester for that type?—No, I should think not.

12277. Do you not think that we four counties, Hereford, Monmouth, Gloucester and Wiltshire—you see them on the map, they are white, there is nothing of the kind exists there—might combine and run those institutions. You would not be called upon to pay one half-penny to Dauntsey, you would merely send some of your better scholars there with scholarships. You have scholarships in Herefordshire, have you not?—We have one or two.

12278. And I dare say you do not know where to send them. There is an opportunity for the one following agriculture, and another in the intermediate stage—that is up to 17—to Dauntsey, and then you come to your highest agricultural scholarship, the one who can prolong his education till 18 or 19. Then you have Cirencester. Look at the rest of the map, and you will see some parts yellow and pink and green and blue. In those particular districts each of the counties comprised in them join to erect and maintain a collegiate and agricultural institution of a particular grade. You know as well as I do that money is so much wanted for other purposes now in counties that no single county can possibly maintain these institutions, and two or three counties must combine?—Certainly.

12279. My suggestion is, if I could see it carried out, that you and Monmouth might join in maintaining a higher elementary school. Your better pupils would go by scholarships to the intermediate school at Dauntsey, not costing you any more than the intermediate scholarships. It would cost you no more to send him there than it would to send him to London, so far as the actual payment went: you would do that by a scholarship. And for the advanced student who wished to rise to the highest points of agriculture, to become a scientific expert and so forth, you have Cirencester. That would bring our group there into correspondence with the rest. At present you are complaining about how little can be done, and that you are isolated—so you are, so is Monmouth, so are we, and so is Wiltshire. Wiltshire and Gloucestershire have the institutions, and it only remains for you to come into correspondence with them. You, jointly, might easily maintain a higher elementary school which would take the boys to 15, and send those that are capable of education up to 16 or 17 to Dauntsey, and the very advanced men up to Cirencester. You might think that idea out at some time. That is an idea of developing the whole agricultural interest of your county, because you are spending a very large amount, very much more proportionately than almost any county, and from what you have said and written your results are not as satisfactory as all that expenditure warrants.

(*Professor Middleton.*) We have still to hear a good deal as to what the results are from the Director. We have only heard one side yet. In going through the report I see there are a great many results set out.

12280. (*By Mr. Medd.*) My one idea is to get the education of Hereford, Monmouth, Gloucester and Wilts consolidated so that there shall be no waste of money. It is not to deprive you of any money, or any other county, but to enable each county to be in operation with those joining it so as to put all the money to the best advantage for each class of the agricultural community? I hope you will think about that.—I will.

12281. I had not seen your report, and of course I can tell from the amount of money you expend you must be doing a great deal of good work, I did not mean to imply otherwise, it was simply to try and bring you in with the adjoining counties so that you might have a good deal more weight in London.—Yes.

12282. Do you not feel that we, by a consultative committee of agriculturists meeting periodically in London, could learn much better what each county is doing, and could bring much stronger pressure on the Government?—I should think that would be a good suggestion.

12283. Cornwall, for instance, wants to learn what Northumberland is doing, and they could meet and discuss their various difficulties and could bring pressure on the Government which they otherwise could not bring.

12284. (*By Lord Barnard.*) You have had a good many suggestions made to you since you have been in the chair. Do they not prove the necessity for the work of agricultural education being national, and not locked up in individual counties, for the very reason that Mr. Medd has just stated that it is desirable that each county should know what is being done elsewhere?—There is certain work connected with agriculture which I think should be

Mr. J. W.
Smith.

2 July, 1907.

done nationally, that particular work which I have rather emphasized about the experimental stations. It is not easy to convince, for instance, members of a County Council that they are to work for the next generation, which practically it is doing in carrying out a great many of these experiments; they like to see results at once from the expenditure of their money. I could give you an instance now. We have a Cider Institute being carried on, which no doubt you know all about.

12285. Yes, we have had evidence from that Institute?—Personally I have the greatest difficulty in inducing our committee to continue to give £100 a year to that Institute simply because they see no present results from the expenditure of their money. I myself think that this Institute is splendidly conceived, and that the work which they are carrying on will ultimately be of the greatest benefit, but it will take a number of years to prove those benefits, and to make use of those benefits to the full. That is the opinion that I hold with regard to it.

12286. You have been convinced, and do you not think in time—and perhaps, with your invaluable assistance—others may become convinced also?—I do not know; certainly these sort of things do gradually trickle down, and one is copied by the other, but I am not quite sure; that it will not take a very long time.

12287. Still, according to your own evidence, we are only at the beginning of this work—you in your county are, at any rate—and it will require a great deal of patience and the expenditure of much time and money?—Yes, it requires a very great deal of patience and it also requires a great deal of tact, and you must show some results for what you are doing.

12288. You have alluded to the fact that some of these people who get this higher education become agents and teachers, surely agents and teachers are necessary members of the community?—Yes.

12289. Provision must be made for their instruction somewhere?—Yes, but I should like you to bear in mind that everything I have said is from the point of view of agricultural instruction in order to add to the productive wealth of each county, and I feel that that can only be achieved by the particular class of farmers whom we have at the present time, the working farmer; those are the people we want to improve.

12290. Yes, but then you have to have other well-instructed classes to help them to improve; for instance, you must have the teacher and the research workers and the agricultural chemist and analyst. —Yes, but there is no lack of those at the present time.

12291. Have you ever seen any of these institutes or colleges?—I cannot say that I have studied them very carefully.

12292. Which part of Herefordshire do you live in?—I live close to Hereford.

12293. You are not absolutely out of reach of the Harper-Adams College then?—I am not.

12294. A visit of inspection to that College or to some similar place anywhere else on the part of some of your farmers might perhaps indicate the sort of advantages which are to be got?—Yes.

12295. Has your county any scholarships by which you can send a clever pupil for higher instruction to the Harper-Adams College, or to Cirencester or even to Cambridge?—

I am not sure that we have sent any scholarships there, but many of our farmers send their sons to those places for some of the higher education.

12296. If you had scholarships more of them would be able to go, and men who could not afford it otherwise would be able to go?—Yes.

12297. So that that would be an advantageous way of spending money?—Yes.

12298. It has not been put to you, but I have no doubt what your answer will be, that education without practical knowledge is valueless to the farmer?—It is valueless in the sense of making a guinea by spending a pound—for making a profit out of his occupation.

12299. When I say valueless I mean that no man can be a really good practical farmer unless he has had plenty of practical knowledge?—He cannot be a successful one.

12300. I do not want you to leave this Committee with the idea that any of us are suggesting to you that farmers can be made in colleges; all we want to suggest to you, and we want to know whether you will agree with us, is that practical farmers can be vastly assisted, not taught their business, by scientific knowledge?—Undoubtedly. I thoroughly agree with that.

12301. (*By Professor Middleton.*) Mr. Medd alluded to a consultative committee which it is possible we might establish in London for the purpose of co-ordinating agricultural education. Do you think that your County Committee in Herefordshire would be likely to accept and act upon advice given by such a central body provided that that advice involved the spending of money on the part of the county?—I should be very doubtful.

12302. Do you think if this central committee had funds at its disposal and could give a proportionate grant, we will say to the amount given by the County of Hereford, that that might alter the attitude of your Committee?—Undoubtedly it would.

12303. Your view is that unless that committee had funds at its disposal it would not be very effective in modifying the action of county committees?—No, I think the county committees as a rule are connected with the land and they have certain ideas of their own, and unless you can show them it is clearly to their interest to alter, they are not likely to take advice from any source much.

12304. (*By Mr. Medd.*) May I add a question to Professor Middleton's; no suggestion has been made yet, I believe, that farmers as such should combine and form a committee of the kind that I have in mind, a consultative committee, but that the consultative committee would be part of the ordinary work of the county committee. You have your County Council Association, which sends a member to London, I do not know whether you are the member, but you have a member of that?—Yes.

12305. No one considers the cost of his going there. If he charges it it comes out of the county funds; is not that so?—Yes.

12306. Exactly in the same way you have members of the Farmers' Club and you have members of the Central Chamber of Agriculture, probably, who attend the meetings of the central body in London?—Yes.

12307. They go at their own expense, it will only be for two or three times a year, or they may go at the expense of the Chamber or the Farmers' Club, is not that so?—Yes.

Mr. J. O. PEET, B.Sc., called and examined.

12308. (*By Lord Barnard.*) You are the Organiser of Agricultural Education and Lecturer in Agriculture to the Herefordshire County Council?—That is so.

12309. How long have you held that appointment?—Two and a half years.

12310. What appointment had you before that?—I was Lecturer in Practical Agriculture in the University College at Reading.

12311. How long were you there?—Four years.

12312. You are a Bachelor of Science—of what University?—Of Edinburgh.

12313. Did you take your degree in agricultural subjects?—In agriculture.

12314. Did you come from a farm originally?—I was on a farm until I was 24 years of age.

12315. A very interesting report by yourself has been put into our hands by the last witness. I see you say the main feature of your work has been the development of a system of short courses of instruction?—Yes.

12316. Which was inaugurated a little more than a year ago?—Yes.

12317. I see you state those have been very successful?—They have been very successful indeed.

12318. Fewer evening lectures are given now?—Yes.

12319. That is lectures about the county?—Yes, in fact

Mr. J. O.
Peet.

Mr. J. O.
Fet.

2 July, 1907.

there are no agricultural lectures given. We did not give any in the evenings last winter.

12320. Can you tell us why?—Really there was not time for the work. During the previous two winters I gave a considerable number of evening lectures, working up interest in the subject.

12321. You have worked up the interest now, and you think the short course a very much better way of instructing the young farmer?—Very much better.

12322. I see there was one course at Hereford and one at Leominster?—Yes.

12323. The Hereford course was attended by ten students and the Leominster by eight?—Yes.

12324. Did those students lodge in the town or did they come in to the classes daily?—They came in daily, with the exception of one student, I think.

12325. Those courses would only serve those pupils in the immediate neighbourhood?—No, some of them came a considerable distance—about ten miles, I think, would be the limit.

12326. How do you propose to reach by means of the short courses students who live more than 10 miles away?—It is our intention to hold these short courses at different centres each year. We worked the north of the county last winter, and we shall work the south next winter.

12327. You record that one of the pleasing features in connection with those classes is the interest the old students take in the general work of the department, and the readiness with which they apply to members of the staff for information and advice?—Yes.

12328. Is it your anticipation that when more of these short courses have been held that many more farmers will take the same line?—We are hoping so, and I believe it will prove to be so.

12329. That is to say, a young man who has gone through a short course realises the advantages he has obtained, and that by keeping in touch with you he will get great advantages?—That is so, and he also influences people that he comes in touch with in his neighbourhood.

12330. So that you are, so to speak, leavening the existing generation of farmers?—Yes.

12331. The length of the course is 10 weeks?—It is.

12332. At what age do they come as a rule?—We do not take them under 16. We have no maximum limit, but I think 25 has been the greatest age.

12333. Are they men who have been farming on their own account or on their fathers' farms?—On their fathers' farms.

12334. I see also you mention the same point on the previous page. You say that an increased amount of work is now done in the way of private advice and visits in response to enquiries?—Yes.

12335. That, I suppose, you look upon as one of the results of this system of short courses?—Yes, and one of the best results.

12336. Is any fee charged for the course?—No fee is charged for the course. In fact, we make a travelling allowance to the students who come to these short courses.

12337. I will not take you through the whole of these items which you mention here, but there is one thing which occurs to me in this report of yours, and that is, that it must be rather an expensive thing to print with all these pictures?—I think it is quite a cheap advertisement of the work.

12338. It must cost a good deal of money, must it not; Mr. Medd has mentioned the subject of finance to the previous witness: does all the finance pass through your hands?—Yes.

12339. So that a substantial sum of that £1,200 must have been spent in printing?—The printing and advertisements last year cost £14 10s.

12340. Is that all?—That is all.

12341. You have a four-weeks' course in dairy work and poultry management?—Yes.

12342. Is that carried on on the same lines?—Yes, on the same lines.

12343. Is that for men or for women, or for both?—That is for women students only.

12344. Do you find the same results—does that interest the girls?—Yes. All the students I think we have had at those four-weeks' courses are people that have taken a short course previously in the travelling dairy school.

12345. It is to carry on and continue the education which they received in the travelling dairy school?—Yes.

12346. Of course you pay a great deal of attention in Herefordshire, naturally, to fruit growing and all the subjects connected with it?—That is so: that is one of our most important industries.

12347. Those lectures you do not give yourself?—No, I do not give the fruit lectures.

12348. Do you organise them?—I organise the whole of the work.

12349. I see you are starting gardening classes in elementary schools?—Yes.

12350. Are those successful?—I think they are very successful. The boys are very much interested in the work, and I think it will be very useful to them.

12351. Is work in these gardens conducted during school hours?—Yes. Our instructor does not exactly give the instruction there: he supervises it and gives a portion only of the instruction.

12352. Does the school teacher give instruction?—The school teacher in many cases, and in some cases a local gardener is engaged by the school managers.

12353. You also have a gardening class for school teachers—that is, to train teachers for this work?—To train them for that work.

12354. Some of them have sat for the Royal Horticultural Society's examination?—Yes.

12355. And were fairly successful?—Yes.

12356. In the way of experiments you have started experiments on the manuring of meadows?—We have two sets of experiments on the manuring of meadows.

12357. When were they started?—This is their second year.

12358. So that it is too soon to say much about them?—Yes.

12359. Did you publish the results?—We did not: we had duplicate plots, and the result was that the duplicate plot rather upset the results last year in some respects.

12360. I presume you intend to make public all the information you get from these experiments?—Yes, but last year we thought the results could not be used by anybody as a guide for manuring, so we did not publish them.

12361. It is your intention to publish eventually the results of your experiments?—Certainly. I may say we have had this season gatherings of farmers on these plots.

12362. Do many attend?—I had an attendance of seventeen local farmers on Friday evening.

12363. Are they much interested in the experiments?—Yes, they are very keen.

12364. Do they ask questions, and that sort of thing?—Yes, they are very much interested.

12365. You also carry out demonstrations in charlock spraying and so on?—Yes, we have made that very popular in the county: a great deal of it is done.

12366. You also have some lectures on farm hygiene?—Yes.

12367. You have nothing special to say about those, I suppose?—No.

12368. I should like to hear what you have to say with regard to hedging, ploughing, and sheep shearing—that appeals to the labouring classes as well as to the farmer?—It does, but a very large proportion of our students are young working farmers.

12369. Who is your teacher in hedging, ploughing, and sheep shearing?—I mean, what is he: I do not want to know his name?—He is usually either a very intelligent labourer or a small holder who has been very successful in competitions of the kind.

12370. Do you have many of these competitions in Herefordshire?—A great many, and there is a considerable amount of interest taken in them also.

12371. Is he paid?—Yes, he is fairly liberally paid.

12372. Are the teachers' methods ever questioned: I mean to say, are the classes ever doubtful as to whether the teachers' methods are right?—Occasionally, but very rarely I think, as the people we have engaged for that work are people that we have had for a very considerable time, and are looked upon as really good workmen and good teachers.

12373. You have not been there long enough, perhaps, but do you think there are any of these lads who have gone through your short courses who might with advantage go

further still and receive advanced education?—We have had some very smart young fellows through the courses, certainly—you mean who might take more advanced agricultural instruction?

12374. Yes.—I dare say some of them would benefit by it. In fact, I am sure they would by a little more advanced education.

12375. There are greater facilities in Scotland for such purposes than there are in Herefordshire?—Yes.

12376. Probably the very fact of the existence of the facilities encourages men to take advantage of them in Scotland?—Yes.

12377. (*By Professor Middleton.*) You went from England to the College in Scotland, did you not?—Yes, from the North of England.

12378. From Lancashire?—Yes.

12379. (*By Lord Barnard.*) There are three items at the end of your report that I should like to ask you about—prizes for efficiency in farm work is the first. Could you tell us what is the class of people who compete for those prizes, and how long they have been going on, and what the effect is?—These prizes for proficiency in farm work have been given for a long time in the county: I believe long before I went there. They are prizes for ploughing, hedging, and sheep shearing chiefly: we also give prizes for farriery—shoeing. Grants are made to local agricultural improvement societies, and the competitions are arranged by those societies.

12380. What do these prizes cost the county a year. I should like to know the total cost of that item if you could give it to us?—Just the grants separately or the instruction and grants combined for these subjects, or just the prizes?

12381. I am only going on this page?—The prizes amount to about £140.

12382. Out of your £1,200?—Yes.

12383. Do only members of these classes compete, or can anybody, whether he has been under instruction or not, compete?—Anyone who is within the age, and who has been resident in the county, but as a matter of fact all the competitors have been through the classes.

12384. Does much the same apply to the prizes mentioned on the next page for the best cultivated cottage gardens?—Yes, the grants there are all made to local societies, but there is no necessity for instruction in the case of those prizes.

12385. Do you think these two series of prizes are of great value?—I do. I may say this year will be the first time that the cottage garden prizes have been offered. Altogether the amount will come to, I think, £25, and it is very likely that the judging of these gardens will bring our instructor into contact with about 400 cottage gardeners in the county, so I think they are likely to derive a good deal of benefit from it.

12386. With regard to the last paragraph, "Assistance and advice to teachers," I think, if you would not mind my saying so, that is most valuable, but how do these words come to the knowledge of the people who ought to take advantage of them? How does this particular printed page get to the people for whom it is intended?—Practically the same paragraph as it appears there appears in the leaflet that I have, and that is widely distributed amongst the farmers.

12387. Do you post it to men you happen to know of—do you think they all know of it?—They do not all know of it, but quite a large proportion of them know of it now.

12388. Have you published it in the newspapers?—I think it has been published in the newspapers once only, at the commencement of the work.

12389. (*By Professor Middleton.*) How long have your short courses been in operation?—A year and a half.

12390. How long have you been in Herefordshire?—Two years and a half.

12391. How do you propose to arrange for buildings—you are going to move from one centre to another, I understand—and how will you provide the necessary accommodation?—We have no accommodation except one good room in which the classes are held: the whole of the class is taken by one teacher at a time.

12392. You find one room is sufficient?—Yes, one good room.

12393. Is there any laboratory instruction given at all?—No, there is no laboratory; we teach them very little science; I take them on manures and feeding stuffs

myself, but there is no laboratory work and very few experiments in connection with it. We give them as much outdoor work as we possibly can. About four afternoons in a week are spent outside.

12394. Botanical subjects do not come in much, chiefly, I suppose, because of the season of the year?—Yes, we scarcely touch on them.

12395. I notice you make it a condition that students entering this course must have spent at least a year on a farm?—Yes.

12396. Do you think that is quite necessary?—I think by doing that we are making sure that the people we take in this way are people who intend to be farmers later on.

12397. Do you think a year on a farm has much effect on a student's capacity; do you think it makes him a better student for your purpose?—For our purpose I believe it does, because he sees the importance of the work then; whereas if he comes straight from school he comes as a school-boy rather, without seeing the necessity and importance for the work as he does after he has been on a farm for a time.

12398. You consider all these short course students ought to have a practical knowledge of agriculture before going through the short course?—Yes.

12399. You have also been a teacher in one of the colleges, have you not?—Yes.

12400. You know, of course, the ordinary college curriculum. Would you care to compare for us the short course and the ordinary two years' course in so far as they affect the practical farmer? What is your opinion as to the relative value of the two? Perhaps it is rather a big question?—My opinion is it does not do to have the young farmer too long away from the practical side of his business. I think about two winters is a sufficiently long period for him to be in college.

12401. You speak with some knowledge, because you were more than two years away yourself, probably?—Yes, I have been a farmer, of course—I have been on a farm—and I have taken a good long course too, and I know the effects.

12402. I know the effects also, and I agree with you. What is your general experience with these short-course students, as to the interest they show in their work?—At least four-fifths of them are very keen.

12403. If you compare them with the students at the college, how would they compare as regards the interest?—Keener.

12404. That has always been my experience too. Then to come to your experiments: I understand that the experiments to which we have had some reference from the previous witness are really in the process of development?—Yes.

12405. You have not got far enough with them because you have not been at work long?—No, this is merely the second season.

12406. On what plan are your experiments conducted—are you using these Manorial Schemes at all?—Yes, we are following them.

12407. So that practically your experimental work is co-ordinated?—Yes.

12408. That is to say, it has been following the schemes published by the Board of Agriculture?—That is so.

12409. I was glad to hear you were not able to publish the results for the satisfactory reason that you employed duplicate plots?—Yes.

12410. In spite of that fact the experiments are yielding interesting results from the demonstration point of view?—Yes, very interesting results.

12411. (*By Mr. Medd.*) You mentioned in answer to Lord Barnard the general cost of administration, but I do not think you gave the actual figures. I do not want them in detail, but the proportion out of the £1,200 that goes to administration?—£513 7s. 5d. last year—that is for my salary, travelling expenses, printing and advertisements, hire of class rooms, and so on. That is all the expenses of organisation and all those short courses. They are not separated here.

12412. The amount is £1,161 in the last year I have?—Yes.

12413. (*By Professor Middleton.*) But it is not quite administration, is it?—No, that includes the cost of these short courses.

12414. (*By Mr. Medd.*) No, the short courses do not

Mr. J. O.
Pect.

2 July, 1907.

Mr. J. O.
Peck.

2 July, 1907.

come under administration?—But I am unable to separate the administration from these short courses.

12415. The cost of administration includes the staff and any office accommodation you may require, and, it may be, a certain amount of expense for a superintendent or director?—Yes.

12416. I do not suppose it does amount to more than £200 a year?—In our case the amount can only be small, because in this £500 here, you have the services of a teacher and the cost of these short courses.

12417. Then the amount is sufficiently small to more than satisfy me. That is what it comes to, because I want it to be as small as possible?—Yes.

12418. As compared with other counties your contribution is a large one?—Yes.

12419. Now in regard to these pupils who come to you for the short courses, varying in age from 16 to 18, what is their actual state of preparation? Have they been a year on the farm, or how far are they qualified in composition, arithmetic and such like subjects to take an intelligent part in the work?—The whole of them, except possibly just an odd student, are pretty well equipped. One half of them probably have been through a decent secondary school, or possibly rather more than one half, and the others have been, I think, generally the smarter lads from the elementary schools.

12420. That answers my question, because it is hardly credible that boys from the ordinary elementary school will after three or four years be equipped sufficiently to take a useful part in courses of any kind, whether they refer to farming or anything else. It is a most difficult thing to do. I mean men who are engaged in various forms of industry tell me that the lads coming to them are perfectly useless for the first year or two in regard to figures and mensuration, and also reading. But your boys come from elementary schools, do they?—Not the whole of them; from elementary schools I think we have had only the smarter ones.

12421. Then in regard to this spraying, have you any objection to that?—Is that the charlock spraying?

12422. Yes, have you any objection from any one?—No.

12423. Because there are cases in which the spraying is very much disliked?—No, there has been no objection raised to it in our county.

12424. Have you been hunting for the gooseberry mildew?—We have a little—we have sent one or two specimens out.

12425. Did you find it?—No, we did not.

12426. You have no permanent institution in your county, have you?—We have no permanent practical agricultural institution.

12427. Lord Barnard referred to the better facilities existing in the North, that is in either the South of Scotland or the North of England. If you compare our map in front of you, you will see Dauntsey in Berkshire. Cirencester is not mentioned, but of course you know Cirencester?—Yes.

12428. Do you not see that they provide you with exactly the same opportunities that you have in the North if you care to take advantage of them. Do you not see that Dauntsey is as good an intermediate school for agriculture for lads from 16 to 18 or 19 as you would find anywhere; and of course you have been to Cirencester yourself?—I have not been there. Though I have been to most of the agricultural schools in the country.

12429. But you know it by name?—I know it well by name.

12430. For these various gaps, and to co-ordinate education in the country, do you not think that Herefordshire, Gloucestershire, Monmouthshire, and Wiltshire could co-operate like the rest of England, because you see the rest of England by those coloured marks on the map is indicated as co-operating in maintaining various types of institutions, and thereby materially reducing the cost. Do you not think that would be a good thing?—It might be a good thing to take the more advanced students in that way, but I do not think it would be a good thing to discontinue, say, our own short courses for the sake of spending money in that way.

12431. No, I do not think it would, and I want to avoid your having to do that?—I think it might be a good plan to send up the better students from our short courses.

12432. What seems to have been your experience is that in your short courses you have a certain number of students

who could really benefit by more continuous instruction, to whom it would be an actual benefit if you had an opportunity of sending them anywhere?—Yes.

12433. Now Dauntsey is a school that answers that type. Supposing you sent two or three of your really promising students, you would have four months' experience of them or six months' experience of them, or, at any rate, you would have had a considerable experience of their capacity in your short courses?—Yes.

12434. Then you have in Monmouthshire also men who are capable of rising to the position of yourself and others of similar rank, and who must go to a college. That is inevitable. I mean in regard to your qualifications. Now if Hereford agreed in consideration of certain advantages, to send two or three scholars to Cirencester and two or three scholars to the lower grade school of Wiltshire, we co-operating in return for the advantages which you give us in short courses, I believe it would be beneficial to the whole area. What do you say to that?—But it appears to me that any one of these colleges would be very glad to accept any students we may send up to them.

12435. But at all events they would not accept scholars at Cirencester or at Wilts. They are limited by their charter; and there again the advantage is this, that all that area would be speaking as one in matters affecting agriculture, whereas to-day Gloucestershire speaks by itself. Nobody takes any interest in Gloucestershire. Herefordshire speaks for itself. But four or five counties combined as those in the East of England are can speak with much more force than one single county in the West acting alone, and not being provided, as I say, with permanent establishments for pupils. It does not interfere with the local work and you find that the local work, for instance, in Herefordshire is in no sense interfered with by the local work in East Suffolk?—I think that so long as it does not interfere with the local work it might be an advantage. But I do not think it would be profitable to take away money from, say, these short courses such as we are conducting now, or practically any of the work that we are doing now, to spend it on scholarships to be taken away.

12436. No, and that is not my idea. My idea is practically a sort of give and take. I say for certain considerations which we have to offer in Gloucestershire we will take your students, and you may have lads of ours on the border of Herefordshire whom it would be very advantageous for us to have at your short courses, who are not in any way qualified to come to Cirencester, and in the same way Wiltshire might take certain of your short course students, who in your opinion are worth having. The expense is a matter of detail, but it is a question of how far it would relieve you of local expense and how far it would, so to say, put the coping stone on your establishments in agriculture. I mean it would be better organised?—I think it would be well worth consideration.

12437. It is a matter for consideration purely?—Yes.

12438. You could not commit yourself to-day, and I could not commit myself to-day?—No.

12439. All I want to see is that white part of the map made like the coloured part elsewhere. At the present we are working in isolation?—Yes.

12440. (By Mr. Davies.) I think Mr. Medd has asked you what your county would be prepared to do in regard to having a central institution for higher education in agriculture and what would your position be personally, supposing that you were to have a college of that sort. Would the county be prepared to allow you to be more or less a servant of the college as well as a servant of the county?—I cannot say what the situation would be in that case as to my position.

12441. Would it not be an advantage to become a member of a staff of such a college and continue your work as before?—Certainly it would be an advantage.

12442. I think you told us that you considered the students who came to your classes were very much more interested in their work than the students at college?—Taking them on the whole, that is so. I am speaking of the longer course students at the college.

12443. Are you in favour of a special department for agriculture in a university college like Reading, for instance, or a college set up in a purely agricultural district, and not a branch of any other university at all?—I think a centre set up in a county would get a very much larger number of students from that county than a centre, say, in a university college would. In our short courses we should secure far more students by having those courses at home than by having them at a college some distance from home

Mr. J. O.
Peet.

2 July, 1907.

12444. You think on the whole it would be better if you could arrange for short courses at a university centre. It would be a greater benefit to the students, do you think?—I think it would be a great advantage to have some properly equipped centre in the district where such courses could be had.

12445. You would have one central place in the county, do you mean?—Yes.

12446. Instead of your migratory classes, as they are at present?—I think so, finally, but possibly the present arrangement is the best for beginning.

12447. You prefer to have that in a county instead of having a confederation of three or four counties and one centre to them all?—I should not like to give a definite answer to that question.

12448. But you know what goes on in every university college throughout the country where they have an agricultural side and where they arrange not only for short courses but for degree courses and diploma courses as well?—Yes. An institution of that character already exists in Cirencester, but supposing the place were not there and we were going to provide an institution of some kind, I do not think that an institution of a university college type would be the most suitable. It should be not exactly a college but more a farming school.

12449. Then you would supplement that arrangement with scholarships, taking your brightest pupils to university centres?—I think so.

12450. You would work it in that way?—Yes.

12451. Speaking roughly, what proportion of farmers' sons who come from the elementary schools attend your short courses now?—I think probably rather more than half of them have been to secondary schools?

12452. But I mean to say, taking the area in which your schools were held last year, what proportion of the men or boys who just that year had left school would attend your classes—a very small proportion indeed, is it not?—A very small proportion.

12453. You would simply touch the fringe at the present moment?—Yes, we should simply touch the fringe.

12454. There is a tremendous amount of work to be done before you would fulfil the function you would like to see fulfilled?—Yes, that is so. I do not think we could ever expect to get the whole of the young farmers to come to courses of this kind, but I do expect we should get a very large proportion of them.

12455. Have you tried intermediate classes in any of the centres in which you have gone in for short courses?—No. This coming winter there may be some.

12456. You have talked of very little science, but you said you went in for the technical more than the scientific side of teaching?—Yes.

12457. And you also told us that there are secondary schools about Hereford?—There are secondary schools but not many farmers' sons attend.

12458. Could you not utilise these schools as centres for more scientific instruction for farmers for your short courses, so that you could bring more science into your short courses by using the chemical laboratories and so on that are attached to these bigger schools?—Not at the present time, because the schools as they exist are not situated well for that work. But really secondary schools will very soon be established in the county under the County Council and then they will be available, of course, for that kind of training, and will be well situated for it too.

12459. You intend bringing the secondary schools into your scheme, do you?—I hope to.

12460. Is it your personal opinion that the secondary schools should devote themselves more definitely to scientific instruction in connection with agriculture?—Pure science—not what one might call agricultural science.

12461. Would you give a definitely agricultural bias?—I call it an agricultural bias, but still it would not be agricultural science, but chemistry and botany, and so on.

12462. Then, speaking in regard to the distribution of literature, have you leaflets which the Board of Agriculture circulate?—Yes.

12463. Is the circulation large in your county?—Yes, I think so.

12464. What is the means by which they are circulated there?—We distribute them ourselves to those who are interested, and others write for them.

12465. How do the leaflets get to the hands of people

who are not very intimately acquainted with the matter?—If they are not acquainted with the matter they do not get the leaflets, I am afraid.

12466. Would it be any use having the leaflets sent to all the post offices in the county and distributed by the postal authorities? Would that assist you in any way?—I think it would be useful.

12467. Then I see you have classes in your elementary schools for gardening. Are there any plots of land attached to these schools?—The classes in almost all cases are carried on in the school gardens, and the gardens are worked as a whole. There are not separate plots allotted to each scholar.

12468. But each school has a garden for itself?—Yes.

12469. Does that apply to all your agricultural schools?—Not to the whole of them, but to the majority of them.

12470. And have the secondary schools got them too?—I do not think any of the secondary schools have them.

12471. Then some of your lectures are prepared by the Parish Council Clerk, are not they?—Yes. The Parish Council acts as the local committee.

12472. Do you find that that works well in making known the fact that you are going to do that work? Do you find that a satisfactory arrangement when you arrive there?—Yes, but we do not trust altogether to that. I look after the advertising to a great extent myself.

12473. But you find the Parish Councils and the other local authorities do not form the best machinery for your organisation for carrying that work on which you want to do. You have got to get people who are actually interested in agriculture, and who are in close touch with your agricultural committee?—Yes, and when I am acting in the district myself I circularise all the farmers in the district directly from the office.

12474. Then, in addition to your short-course classes, you hold public lectures do you not, in different parts of the county?—Yes.

12475. Do you find that they are well attended?—I think the attendances are very good. They are very satisfactory indeed, and we certainly get the right class of people. We get the people who are interested: at agricultural lectures we get the farmers, and at the garden lectures the cottagers; we get people who come there to learn and not merely to criticise.

12476. These lectures are of a practical character, and you do not try to teach them science?—No, not at all.

12477. You find they are of practical advantage afterwards?—Yes, and the interest in the work is great. The interest in the whole of the work seems to be greatly increasing.

12478. Really it is more a means of advertising your work?—In the case of the local agricultural lecture that is so.

12479. They are not so much a means of instruction as of conveying an advertisement?—In the way of advertisement, and to let the people know that if they want special information they can apply for it and get it at the office.

12480. Then have you any agricultural circulating library in the county for farmers?—No, we have nothing of that kind.

12481. Do you think that would be an advantage?—Yes, I think it might be.

12482. It would be very useful for your short-course students?—Yes, it would be very useful to them.

12483. (By Professor Middleton.) You have studied or taught agriculture in a number of different districts, I believe, in Britain, and I should like to ask you whether you think the supply of University colleges and University departments is sufficient, or whether a further supply is necessary?—I think it is sufficient.

12484. Your short course aims at being a final course. You have no intention of preparing lads to go further, have you?—Yes, that is so.

12485. So that if you did wish lads to go to a University centre you would prescribe for them quite a different training from the training you give them in a short course; is not that so?—Yes, that is so. Ours is a final course, complete in itself.

12486. (By Lord Barnard.) You spoke just now, in reply to Mr. Davies, about secondary schools, and said that there are not secondary schools for farmers' sons. I do not understand what you mean by a secondary school for

Mr. J. O.
Peet.

2 July, 1907.

farmers' sons. How is that kind of school different from a secondary school for other people's sons?—A secondary school in which classics are the main portion of the education is not the school exactly, in my opinion, for training farmers' sons at.

12487. But why not?—I think a classical education is not suitable.

12488. But I do not imagine that a classical education is intended to turn out classical scholars only; I think most secondary schools at the present time have a very wide curriculum; but perhaps in Herefordshire it is different. I will assume that secondary schools in Herefordshire are perfectly classical, but what class of people in Herefordshire do want agricultural education?—At the moment I can only think of two public secondary schools for boys in the county. One has just got a fair proportion of farmers' sons, but it is not situated so that these can travel in daily. The majority of them would have to board. The other is a school where classical education and preparation for the University is aimed at.

12489. Then you rather qualify what you said, and instead of saying there is a want of secondary schools for farmers' sons, you say there is a want of secondary schools, and leave out the words "farmers' sons"?—Yes.

12490. It would be a pity to assume that a farmer's son does not want a general education the same as anybody else?—Yes, that is so, but when you get education stopping at the age of 15 the range must be limited.

12491. Does not that apply to an enormous number of people throughout the whole of this country?—Yes.

12492. Many witnesses have told us that it is most desirable that before the young farmer begins to specialise he should have a good general education, and do you agree with that?—Yes.

12493. Then an ordinary secondary school suitable for other classes besides farmers' sons would answer the purpose?—Yes.

12494. Then are you acquainted with the Farm School at Basing in Hampshire?—Yes, quite well. I have examined that school many times.

12495. Do you think that such a school as that would be of any use in Herefordshire—that is essentially a technical school? Some witnesses have told us that they would like to see a school of that type established in their county, and I do not know whether you would think it would be a good thing to have it?—I should be very glad to see it.

12496. The word "school" is rather a misnomer as applied to a place where farmers' sons can get technical instruction in their own business?—Yes.

§ 12497. (By Mr. Medd.) Would you prefer a type of school like that at Dauntsey to the type of school at Basing?—That is to say would I prefer a school devoted entirely to agriculture and not to general education?

12498. Or a school which gives a certain amount of time to intellectual work and the rest to farming work for advancing a lad?—I would prefer that the student should get his general education in an ordinary secondary school,

and that afterwards he should proceed to a school devoted entirely to agricultural and technical work.

12499. Then that lands us in this difficulty: Dauntsey is a secondary school with the predominant feature agriculture, whereas Basing School is a Farm School taking young lads in the main, with very little secondary education. Is not that so?—Yes, that is so.

12500. I thought from your answers to me before that you would prefer the lad to get as much secondary education as he could, and that you did not want a secondary school with an agricultural side combined with it. Such a school as Dauntsey was primarily intended as an agricultural school, and is merely nominally under the Board of Education, and simply gives all that it can give to agriculture, with due regard to ordinary education. It is of a higher class?—Yes. I cannot help thinking that it is much better students should get their general education in the secondary school, then have a time at home for learning the practice of farming and then obtain their special agricultural instruction in a school devoted to it.

12501. At what age would their education be over?—Very few will attend the secondary school longer than 16 years.

12502. Do you not more or less agree with me in this: you may send your boy to a secondary school where you like, but your ordinary farmer will not send him anywhere else to learn farming except at home?—I find that after the student has been on the farm for a little time he can pick up an agricultural education very much better than before.

12503. But I am talking about secondary schools where there is no agriculture, and where there cannot be?—Just so.

12504. (By Professor Middleton.) You would like them to have some secondary education, and then come to you as short-course students at 18 or 20?—Yes, about that age.

12505. Or if the student is going to the university, you would want him to continue his secondary education up to the age of 17 or 18?—Yes.

12506. And then get a year on the farm?—Yes.

12507. (By Lord Barnard.) One question on the point of Board of Agriculture Correspondents. Many of the witnesses here have been asked a question or two about it; do you know two or three in your county?—I know some of them.

12508. Have you ever made any use of them, or communicated with the Board?—Not through them with the Board.

12509. To try to get information from the Board?—No, although I have talked with them. They are people I know personally, and that I have talked about matters with, but not officially.

12510. You said just now the Board of Agriculture did do that kind of work?—Yes.

12511. Do you think the Board of Agriculture Correspondents might be made more useful as a means of extending communication and as a means of inter-communication between the farmer and these schools?—Yes, they might.

Mr. CHARLES B. STIBY called and examined.

Mr. C. B.
Stiby.

12512. (By Lord Barnard.) You are an Alderman of the Dorset County Council?—Yes, I am.

12513. And you are interested in the work carried on by your county in the way of agricultural and scientific and technical instruction?—Yes, we are.

12514. How is that work carried on by your county—by what authority is it carried on?—In the first place, when I say "we" I mean the Committee. Do you mean by an agricultural instructor?

12515. I mean how is it controlled—what is your Committee?—It is the whole Committee of Education.

12516. That is the statutory committee?—Yes.

12517. That is the local education authority?—Yes, that is the authority.

12518. Including co-opted members, I daresay?—Yes, we have some co-opted members, and they form a part of it.

12519. That is a very large body?—Yes.

12520. With many of them probably not interested in this particular subject?—Not the least.

12521. Do you think it would be an advantage to you in your county to do what is done in other counties, that is, to have a sub-committee, and that sub-committee to deal with this question?—Yes, I think it would. But you mean subject, of course, to the approval of the whole Committee afterwards?

12522. Yes; but that would be, I suppose, a detail?—I do not think the Sub-Committee would undertake that. But there are sometimes some thoroughly agricultural questions on which the Sub-Committee form an opinion, and the whole Committee confirm or object to it.

12523. You are an agriculturist yourself?—Yes, for 50 years I have been one.

12524. Do you know what the practice is in the neighbouring county of Wiltshire?—No, I could not say that.

Mr. C. B.
Stoby.

2 July, 1907.

12525. They have, we have been told by witnesses, a sort of agricultural committee which deals with a good many matters relating to agriculturists?—We have one in Dorset which deals with manual instruction. That Committee is not in any way connected with the Education Committee, except to spend the funds which the Education Committee allow them.

12526. It has been suggested to us by a gentleman whose name and authority you will no doubt recognise, Lord Fitzmaurice, and it has commended itself to me, and perhaps to other members of the Committee, though it might require legislation: that there should be a statutory Committee of each County Council which should have control of all matters relating to agriculture, including agricultural instruction, and also such matters as the Fertilisers and Feeding Stuffs Acts, the Diseases of Animals Act, and I should think Small Holdings, and that you should come under such a Committee?—Would that Committee that you suggest be entirely formed from the county.

12527. It would be the County Council Committee?—Would the County Council elect it?

12528. Yes, they would appoint it, of course. If it required an Act of Parliament, you might give them power in that Act of Parliament to co-opt?—Yes, I think it would be necessary to co-opt, because some County Councils might not have a sufficient number qualified to act upon such a Committee without co-opting.

12529. I take it in Dorsetshire you have plenty of agriculturists?—We are not over-burdened with agriculturists on the County Council. I should think there is not more than a seventh, perhaps, on it.

12530. I see a very large proportion of the males of the county over ten years of age are employed as agriculturists, so that practically agriculture is the preponderating industry of the county?—Yes.

12531. Do you mean tenant-farmers only?—I mean tenant-farmers actually renting farms. We have retired farmers.

12532. I meant anybody who is interested in or has any knowledge of agriculture?—That would be different. I was thinking you spoke only of tenant farmers.

12533. You have a considerable number of them on your County Council?—Yes, I think we have enough of them to get a committee who will understand it.

12534. You might have even a veterinary surgeon on such a committee?—Yes.

12535. I see from the notes you have given us that you have something to say on a question which is a little outside the scope of our reference, but it naturally touches on it, and that is the question of the supply of secondary schools. You have some secondary schools in the county, have you?—Yes, we have several.

12536. But you would like to see at least four of these schools, one for each division, with an agricultural side to it?—Exactly.

12537. Do you know of such a school, or can you mention such a school, so as to indicate to the Committee the type of it?—There is one at Sherborne.

12538. But do you know any school in existence with an agricultural side to it?—No, not outside the county of Dorset.

12539. But is there one there?—Beaminster has an agricultural side.

12540. Can you tell the Committee of such a school in any other county which you would like to see copied in Dorsetshire?—No.

12541. Then it is entirely an idea of your own as to the agricultural side?—Yes, my own and the Committee's.

12542. I do not know whether you are aware that such schools have not been universally a success or that the agricultural side has not been a success?—I think that has been due to some friction and not from natural causes.

12543. I am sorry to say in the school I am acquainted with it is due to natural causes and the agricultural side is steadily shrinking away?—Might I give my idea as to why I put that down in my *precis*?—

12544. Do so, please?—First of all I take it the secondary school would be a commercial education one, and the boy of 15, or between 15 and 16, if there was an agricultural side to the school, if he had had some scientific agriculture, would be better qualified when he returned home to his parents to carry out agriculture to greater advantage. I do not believe you can teach agriculture from a secondary

school so as to make a very good agriculturist. I have taken a great many pupils in my time, and I never considered I could turn one out satisfactorily until he had been through the whole routine for two years.

12545. The routine of farm work?—Quite so; because in one year he would not see the necessary and proper rotations. But I think a boy who has been to a good secondary school and had a little knowledge of science would be in all probability better able to take up the practical class course than without it.

12546. Then your theory is not quite the same as that of a good many witnesses we have had before us, which is to the effect that a good secondary education should precede any special form of instruction?—No, I think not.

12547. Then you have mentioned just now your conception of a secondary school, which is not exactly the same as mine. You mentioned a school specially providing a commercial education, but my idea of a secondary school is a school which does not provide for any specialisation?—No, not specially.

12548. But educates as distinguished from instructs?—General education. It is not classical. If I had two sons, one of whom I wanted to bring up to be a farmer, and the other something else, and there was a secondary school in the county that had an agricultural side to it, I would send that boy to that school in preference to any other secondary school. That is the point I wish to make.

12549. In the census report which I have in my hand here, there are 21 different classes of occupations in this county?—Yes.

12550. These are very roughly classed together, so that if your theory were carried out we should want 21 different classes of secondary schools, with a special side for each different type?—But I am only speaking of agriculture.

12551. But do you think the taxpayers and ratepayers of the country would consent to such a thing?—No, I do not think so, if you put the question to me directly. I understood the question you wanted an answer to was whether there was any benefit from it, but I do not think and have always maintained that it is not fair to any county to educate one particular class above another. I have always maintained that, and I have got into very hot water at times with my committee on that point.

12552. But still you would like to see some secondary schools; and would you say a word or two about Beaminster school now? I believe there has been an attempt to give agricultural instruction to the boys in that school, has there not?—Yes.

12553. It was given by the county lecturer, was it not?—Yes.

12554. It was not altogether a success, was it?—No, not altogether, I believe.

12555. And that was so owing to the fact that the instructor had a long way to go to get there?—Yes, that was so.

12556. He spent much of his time travelling backwards and forwards?—That is so.

12557. You also in your county have some short courses in agriculture, have you not?—Yes.

12558. Are they popular?—They are popular.

12559. And are they useful, do you think?—I think they are very useful.

12560. You were talking about what you would do with a boy of your own—and would you recommend any man you knew to go through that course of lectures?—Yes, I think six months will do a great deal of good.

12561. I see they have only just been started?—Yes, that is so.

12562. But you have heard perhaps that in other counties they have been found most useful and most successful?—Yes.

12563. Was the course held at more than one centre?—It was held last year only at Dorchester, but the Committee intended that the lecturer, if he had time, should go to different parts of the county every year so as eventually to cover the whole county in time. Now that another lecturer will take the work at Beaminster we shall have a larger area for lectures.

12564. That applies to the agricultural part of it, does it?—Yes.

12565. Then you have a dairy school, have you?—We have had a travelling school for many years.

Mr. C. B.
Stiby.
—
2 July, 1907.
—

12566. Do many members of your County Council have any objection to this money being spent on agriculture ?
—No.

12567. There is no disposition to cut your grant down ?
—None whatever.

12568. How is it granted ? Do you budget for a certain amount every year ?—It is budgeted.

12569. And you always get it, do you ?—Yes.

12570. I think that proves that your Council are interested in agriculture ?—Yes, and we are an agricultural county.

12571. Do you not in some way contribute to the college at Reading, or you were at one time a contributing authority to the college at Reading ?—Yes.

12572. What was your reason for discontinuing that ?—The reason was that we were deriving no actual benefits from it by sending any pupils there, and our funds were so low that we thought that we ought, wherever we possibly could save any money, to save it. That was the object. It was not done by any particular wish.

12573. I suppose your Committee gives scholarships ?
—Yes.

12574. Have they ever contemplated giving scholarships to intelligent farmers' sons, or boys who are going to farm, to enable them to get the benefit of the Reading course ?—No, that has not been considered.

12575. Do you not think that would be a good plan ?—I think so, providing, as I think I have said in my note, that a boy shows sufficiently superior intellect to make it worth while doing so ; but I do not think we could use the college generally.

12576. But I fancy it is an observation which is very old and which has applied from the beginning to Oxford and Cambridge Universities, that a boy coming with a scholarship is more able to derive some benefit than the ordinary pupil. But perhaps you give them indiscriminately in your county ?—For a boy of 16 going to carry out the business of a farmer in an ordinary way, I do not think myself that Reading College will do him very much good. When I say that, I do not mean Reading particularly, but any college.

12577. You would not propose that these scholarships should be abolished ?—No, certainly not.

12578. Then, if you have them, you must assume some school has some students who will seek them ?—Yes.

12579. Supposing you had students in your county who wanted to go, and showed sufficient aptitude, would not the scholarship be the best way of letting him go. That would save spending money on places where you have no use for them, and at the same time your pupil in Dorset could not complain of having no place to go to ?—The funds would not run to it.

12580. Not the scholarship ?—No, not to a scholarship to send away. But perhaps I ought not to give so decided an opinion, because I am not quite sure on the point.

12581. Supposing, for instance, a clergyman's son, a clever young boy, can get an exhibition to Oxford, you would say by all means let him go ?—I would send him first to my practical farm.

12582. But I am only taking that case so that when thinking of farming we may not get our heads down below the rest of the world. Taking the case of a clergyman's son or a bank manager's son who gets a scholarship, would that not be a good thing to go to Oxford or Cambridge with ?—Yes, decidedly.

12583. Why should not that apply in the case of agriculturists too, where you have a specially clever boy ? Why should you not give him facilities to go on and get higher education ?—Of course you mean chemistry and everything connected with agriculture ?

12584. Yes ?—Then any college such as that would be a most desirable place for him.

12585. But do you not think it is the duty of your County Council, as the public authority, to help any specially intelligent boy or girl either to advance themselves in knowledge by means of what is known as the "ladder" ?—Yes.

12586. To pay the fee, say ?—Yes.

12587. Would you not say it is a pity that that intelligence should be wasted to the country if it could be developed by means of a scholarship, and do you not think it is a good way of spending money on the part of education authorities ?—Yes, that may be done, but it would not apply to the ordinary agriculturist.

12588. It is found to apply in other counties, and why should it not apply in yours ?—I take it a college education of that sort would only be useful to boys of particular or special intellect.

12589. Quite so—that is exactly my meaning ?—But if you take an ordinary agriculturist's son, the same as my own son would be, I should not send him to college unless he was to follow it out as a profession afterwards, as an instructor.

12590. But those people must be found ?—Then I should send him, decidedly.

12591. If a parent cannot afford to give him the education, I want to ascertain whether it is not your view that the County Council should provide scholarships for such cases ?—Yes, I think so—I quite agree with that.

12592. I am reminded by the Secretary, Mr. Brooke-Hunt, that a former Reading student from Dorsetshire is now county instructor in Buckinghamshire ?—Yes.

12593. The system of scholarships, as I dare say you know, is a very ancient one in this country, and it has been found to work so well that it has been practically extended now to all classes in life, and you would agree with me now, I understand, that you do not see why it should not be extended to agriculturists too ?—Yes, I quite agree with you there.

12594. Have you ever sent boys to Dauntsey School ?
—No, not that I am aware of.

12595. Do you not think that it would be a pity if each county locked itself up and said that no boy shall go out of the county, and that sort of thing ?—I would send him anywhere where he could get instruction.

12596. I think you are of opinion, judging by the last words of your note here, that more funds are necessary for this purpose ?—Yes, that is so.

12597. I suppose I need hardly ask you the question, but you think they should come from the central Government ?—Yes.

12598. You will agree with me, I suppose, that any system of education supported by such funds would have to be part of the central system—an organised system all over the country ?—Yes, that is my idea.

12599. And that each county should not get more than its share ?—No.

12600. You would not object to its being a national system ?—Not at all.

12601. It would be for the benefit of your county and all others ?—Yes. You cannot have too much education.

12602. You do not approve of your present system of dairying instruction, I see ?—No, and not only myself, but I think the Committee are agreed there. We have had a very able lecturer. The opinion of the Committee, or at least it is my opinion, and the Committee I think are on the way towards it, is that instead of having an instructor going about to instruct, and purchasing cream and milk for demonstration, it would be better to select, and perhaps I might say subsidise, three or four cheese makers and butter makers properly qualified to teach as lecturers, and send boys or girls for six months to these dairies, where they would see the work carried out day after day, without our going to the expense of purchasing milk and cream and dairy utensils.

12603. That would almost the same as the old-fashioned system of apprenticeship ?—Yes, it would be the same exactly.

12604. Have you a sufficient number of qualified cheese makers and butter makers who have gone through anything like a scientific training ?—Yes, there are plenty in our county.

12605. They have been to Reading perhaps ?—Yes, and we have one or two dairy factors of very superior qualifications. There is one at Blackmore Vale who is a very highly qualified one.

12606. You would have no difficulty in finding teachers ?—I cannot see that we would, but anyhow no doubt it could be arranged.

12607. Do you take farm pupils yourself ?—Yes, I farm myself.

12608. And do you have pupils ?—Yes, but I have not one at present.

12609. But you have taken them ?—Yes, I have taken a great many.

Mr. C. B.
Stiby.
—
2 July, 1907.
—

12610. And you would have these dairy pupils on something the same lines, I suppose?—I have had them before. If a pupil, was sent to me for a year, I should not insist that he must stay two years. I only recommend two. I had a pupil from one of the colleges who came to me, but he was not much good.

12611. You think he should have begun with you first and gone to the college afterwards?—I think that would have been better.

12612. I fancy from the evidence we have had that is now almost the accepted theory, and I think it is universally admitted, is it not, that farming cannot be taught except on a farm?—It is impossible.

12613. I think we are all agreed on that. I have never heard anybody advance the contrary opinion yet?—It is utterly impossible.

12614. Have you ever heard of anybody who advanced the contrary opinion?—I do not think that I have.

12615. I do not think such a person exists except in imagination, when he is put up to be knocked down?—No.

12616. What is your opinion of instruction in gardening?—I think myself that gardening could be pushed to any extent to advantage, and I think it would take the place of horticulture. I think, providing the garden can be got, or a plot, it would be a good thing. I am strongly of opinion that gardening to schools is very advantageous—not gardening to the county. I am speaking now of elementary schools and not of secondary schools, of course.

12617. I was rather thinking of county instruction in horticulture, and not only in schools but elsewhere?—It is not generally appreciated I think in Dorset.

12618. Do the labourers have gardens mostly?—No, but we have a few gardens. But the Education Committee, wherever there is an application, or where they are able to start one, provide funds for it.

12619. (*By Mr. Medd.*) In your proof you say, "Gardening. This is not considered to have any special advantage"?—A great many of the Committee do not think so, but it is not general. Perhaps I ought to have said I was giving my own view of it.

12620. You were merely speaking of school gardening then?—Yes, but I am speaking now of elementary gardening.

12620a. (*By Lord Barnard.*) The words you wrote are: "Gardening. This is not considered to have any special advantage"?—Yes.

12621. What kind of gardening is that?—We have several schools.

12622. What kind of gardening had you in mind then?—I was really then thinking more of horticultural instruction, because that is carried on in the gardens. When I lived at Buckland Newton we had a gardener who was kindly lent to us by a gentleman in the neighbourhood. He went round to teach gardening, but it was really utterly a failure.

12623. (*By Mr. Medd.*) That may have been due to the teacher, of course?—That was a gentleman who had a very large garden, and he had a highly qualified man, but they did not appreciate it.

12624. Would you not now, after what you have said about the elementary schools, eliminate the reference to the elementary school here in your *précis*?—Yes.

12625. "Except in an elementary school," you would put it?—Yes, those words would explain exactly what I mean.

12626. Then it is "Gardening. This is not considered to have any special advantage except in the elementary schools"?—I think the gardens are an advantage in elementary schools.

12627. You would say, "This is not considered to have any special advantage except in elementary schools"?—Exactly—that will do.

12628. (*By Lord Barnard.*) Then you are very anxious, I think, that manual instruction should be encouraged in every possible way?—That is one of the things which the Committee are very favourable towards.

12629. What steps are they taking to encourage it?—It is rather a singular thing, but in South Dorset they have a grant of £133.

12630. From whom?—From the County Council, or from the "whisky money," as I think you term it. There is no other part of the county as a whole which has made any application beyond a place called Holt.

12631. I do not think you need trouble with the details of every district.—But it is a singular thing that South Dorset should take it up so thoroughly and have a grant of £133 or £130, I think it is, while in other parts of the county there are only three places in which they are granted £20 each.

12632. South Dorset is a very vague expression, because it has no Council or body, and how do you make that grant. You cannot make a grant to a place, but to some body or person?—There is a committee formed composed of South Dorset farmers, and they draw up their code for spending this £130 in thatching, sheep shearing, and various other things.

12633. For instruction in these various processes?—Yes. That is where I differ very much in regard to the instruction. I think it could be very much improved, and I hope it will be, because it is only in the last fortnight that I brought it before the notice of the chairman of that committee. The instructors under the present system have to give a certificate that they have given a lad three lessons consisting of three hours. Now what I should like to see done would be that the farmer or the head of a sheep shearing company should give a certificate that a certain lad had to his knowledge been at a farm working at that particular object for which he is going up to be tested. That would be much better than an instructor, because you know very well that, taking hedging, for instance, nine hours in hedging instruction is simply no use whatever. But a lad who has been with his father on a farm for a year or two years would have, of course, to be qualified to go up. The consequence is that the instructors being paid ten shillings, they go and get young lads that do not intend carrying on that occupation afterwards to come up, in order to get their ten shillings on the certificate.

12634. But that is not much use to us, because you are only criticising what ought not to be done, and we have not heard of it being done elsewhere. All we want to ask you is as to what should be done, and I think you have told us practically that?—I think this instruction, which is perhaps appreciated by the men, should be cut off.

12635. I gather from what you say that you think this money should not be expended in instruction at all, but in premiums to the lad who has been instructed?—I would not cut off the testing.

12636. But testing is not instruction?—I would strike that off.

12637. Strike off the instruction?—Yes, the instruction.

12638. And spend the money in getting premiums for the lads who had been instructed?—That is so.

(*After a short adjournment.*)

(*The Witness.*) Lord Barnard asked a question the answer to which I should like to qualify a little. It was whether I considered it fair to the ratepayers that one industry should be supported above another. From that point of view I said I did not think so. But if you look at it from another point of view, that is the national point of view, and think that the agricultural instruction is going to produce more food and so on for the benefit of the whole country, then of course I should give another opinion.

12639. (*By Lord Barnard.*) I do not think I quite used the word "fair," I cannot recollect, but what I intended to say was, that if you were going to do it for agriculture, would not you have to do it for a great many other industries as well. I was looking at it not from the agricultural side only?—Yes, but I thought I should like to make that qualification.

12640. (*By Mr. Latham.*) Do you wish this Committee to consider that the constitution of your County Council is detrimental to agricultural education?—No, certainly not. It is inclined to favour agricultural instruction, most decidedly.

12641. You made rather strong remarks just now on secondary schools with agricultural sides. Have you any schools in your district?—Yes, one.

12642. Is it beneficial?—I am scarcely qualified to say I know that they are or are not.

12643. Why do you wish the secondary school to have an agricultural side?—Because if agriculture is to be learned, and it is considered desirable, I think that there is no way like having it attached to the secondary school, because a secondary school is a school of general education and the instruction which they get there from an agricultural point of view might be very beneficial to them in after life, when they go back again to farm.

12644. Do not you think scientific teaching is a thing so

Mr. C. B.
Stibb.

2 July, 1907.

entirely by itself that it would be very much better that the scholars should get this scientific training at a college or at a centre set apart specially for the subject?—May I ask what do you mean by scientific?

12645. The teaching of the working of certain manures on certain soils and the amount of chemistry that it is necessary for a farmer to know, and the general things that a lad would get to know if he went to college?—Yes, I think that would be beneficial, decidedly.

12646. Then would it not be much better to allow him to go to a centre after 16 or so rather than try to cram him with that knowledge at the secondary school, which he has very little time to take, or would not it be a loss to him in his general education if he was obliged to take it?—But I understood that the scientific part of it was taught in the secondary school in a rudimentary way.

12647. (By Lord Barnard.) You did not understand that from me, I suppose?—No.

12648. Because my opinion is rather the reverse?—Just so.

12649. (By Mr. Latham.) The evidence we have heard here is that the general teaching of the secondary school is quite sufficient for these lads to go on with without scientific training, and if they are to have scientific training at all it would be much better for them to go to a centre or a college which was established for that particular purpose?—But if you take agricultural instruction as being very good from a secondary school you could not send the number that you are educating there to college. That would be impossible. You could only send one or two of the brightest, unless you give us a large amount of funds.

12650. Then in all probability the general body of men would not get any advantage by going there, but there are certain clever men, or men who wish to have a better education, who would like to go to these scientific schools?—Then such a boy as that it would be beneficial to and useful for.

12651. And would not scholarships from the County Councils be well applied to give boys that chance?—Yes, I think so, but if you did that you would abolish the secondary school teaching of agriculture, would you not?

12652. But I think the secondary school teaching should be the general education. The scientific education would be better kept a separate thing and taught at the scientific centres or colleges?—Then I gather from you that you rather recommend not having an agricultural side to any secondary school, but you would use the funds for certain boys from a secondary school going direct to college.

12653. I might say when you say use the funds it is impossible to stop using the funds for secondary schools. That would be obliged to go on, but whether it would not be better to have an increased grant or not is another thing?—Yes.

12654. You have spoken about your pupils that you have taken. Have not you ever had any pupils who would be very much better if they could get a little scientific education after you had done with them?—Certainly, if it was necessary for them.

12655. Possibly you have taken a great many pupils, and they have received great advantage by being with you, but I do not suppose you have ever attempted to teach them science?—No, certainly not.

12656. You will not go so far as to say that no scientific teaching is of any advantage?—No, it is of great advantage. For instance, it was only a few days ago I went to Mr. Forbes and said, "I have some roots, and I want to put lime on the plot," and I asked, "Would it be better to put soluble phosphate on it?" And he said "If you do the lime will convert the soluble phosphate into an insoluble one, and you will derive no benefit from it for the next two or three months." I only mention that to show that science is valuable.]

12657. That is excellent evidence to show that however much good your theory and your teaching and practice has done to your pupils, very possibly you would leave science alone, and if they could get a centre where they could have it taught to them, the very fact that you have been speaking of never would have existed?—I quite agree with you.

12658. Now with regard to the lectures, which you are very fond of, what sort of lectures are they?—I have not attended one, because I have so much to do besides, but the lectures were on general farming and veterinary science, and the diseases of animals, and the rotation of crops, and in fact the whole vocabulary of farming.

12659. Virtually, that to some extent is practical agriculture?—Yes, and I know that scholars up to the age of 15 attended them. The lecturer took them out and showed them the stock on a farm, and gave them, I believe, a very interesting lecture on it.

12660. These lectures have been entirely practical and not scientific, have they?—Entirely practical and no science whatever, except the results of science.

12661. Would it not be very good then if these lectures could be illustrated by experiments with manures?—Do you mean testing?

12662. Testing or demonstration?—That is already done throughout the county. Our instructor has certain plots of land given to him by different farmers, some on the chalk, some on the clay, and some on rich soils, and so on, and then conducts a series of experiments throughout the county, which are tabulated and circulated in the county.

12663. That to all intents and purposes is scientific, is it not?—Yes, that is scientific; and that costs about £20 a year.

12664. You made the remark just now that you knew better than allow your son to follow the occupation of his father as a farmer, I think?—Yes.

12665. I suppose that was more than anything else because the profits of farming have been lessened?—That is so.

12666. It was not because you disliked farming?—In my younger days I should have preferred following another occupation to that of farming, but was not able to do so. I should not bring up my son to be a farmer unless he really wanted it, which would be another thing, of course.

12667. But we must not run away with the idea that you have had 50 years of purgatory, must we?—No, certainly not; but farming takes such a big amount of capital, and I should originally have preferred to have used mine in another way.

12668. Altogether then, that is rather against what you are so strongly advocating. You say it is a benefit for people's sons to be brought up in a profession that you do not like yourself?—It is entirely a question as to whether they really want to become farmers; if they do, and come to me, I try to instil into them what I know myself.

12669. But you consider this system a very bad system, and you would not advise them to join it?—Yes; one man's son I took turned out remarkably well, and I did all I could to induce him not to follow farming. He said, "Yet you are taking my son, and I said, Yes, but I advise you not to send him to it."

12670. You have had no dairy schools travelling about the county, have you?—Yes, we have.

12671. Have they not done good?—I am not so sure of that. They have done good possibly. If there were these scholarships it would give the girls and boys the opportunity of seeing the work carried out in a factory by a qualified person. I do not mean to say they have done no good—certainly not.

12672. Your county has made a great deal of butter, has not it?—Yes, Dorset butter is considered to be the butter of the world.

12673. It has very much improved in the last few years?—I do not think it has been greatly improved. I think we have always been pretty well noted for it. The quality of butter is not obtained only in the making, but it has a good deal to do with the soil from which it is made. Some soils will produce excellent butter while other soils will not produce such good butter.

12674. That leads me to ask another question altogether. Have you had no help through science showing that certain soils make bad butter and that there is some reason for it?—Yes, I could give you some examples. If you stock land with sheep for some time then it will require different management from what it would if the sheep never have been put on the land.

12675. In years gone by, when we had very little scientific knowledge, that was scarcely found out, was it?—I think that has been generally known, ever since I can recollect at any rate. I should say that was generally known.

12676. You make a great deal of cheese in the county do not you?—Yes, the best cheese, and skimmed cheese, Skimmed cheese is the principal cheese—that is blue cheese.

Mr. C. R.
Stoby.

2 July, 1907.

12677. And you have had these schools?—Only this travelling instructor—that is the only school.

12678. But have not you had stationary schools in Dorsetshire?—No; there are factories, but not actual schools—not that I am aware of.

12679. But has not your County Council supported a school?—Not a school. The County Council provide money for this lecturer to go round lecturing and to make the goods.

12680. (*By Lord Barnard.*) An itinerant school only?—Yes, we have an itinerant school.

12681. (*By Mr. Latham.*) You have that, and you will admit that has done a very great deal of good?—I do not say a great deal, but I think it has done good. But I am not in a position to say it has done a great deal of good.

12682. I happen to know a little about it, and I was under the impression it was supposed to have done a deal of good?—You can get good out of everything, I hope, but I do not consider myself that it is the proper way of increasing the value of people's knowledge. I think there is a better way of doing it. That is all.

12683. But the better way you advocate is one that is scarcely any advantage to the general public. You cannot get people to go to these several places?—Yes, I think they would. They would go more than they would attend these lectures.

12684. But when they go to these dairy schools, are not they obliged to reside there?—Yes.

12685. You would scarcely get that done at the factory?—That would be covered by scholarships.

12686. That would be for one or two, whereas in this case you have a great many?—We spend about £400 a year for the itinerant teacher and that £400 would mean a great many scholarships, and then again we have to buy the utensils.

12687. And you are dependent very much on the farm that you go to?—Yes, of course you would have to be dependent on that—that is, on the dairy people. Very few farmers in the county of Dorset make their own goods. They are all let to dairy men.

12688. Do you pay the railway fares of the pupils going backwards and forwards?—At the present time?

12689. Yes.—No, I think not; but I am not sure, and I should not like to say yes or no to that.

12690. You were talking of gardening *versus* horticulture just now, and it would be very interesting to us if you would describe the difference to us between the two?—The gardening I thought favourably of would be in gardens attached to the technical schools, where the boys could be taught gardening by the master of that school.

12691. But would not that be in a very small way indeed?—It is in a small way, but it would be large if many schools took it up. It would be an interesting thing for the boys.

12692. I quite agree with that, in a very elementary way?—In a very elementary way.

12693. But would it not be of very much greater advantage if you could have a larger field and teach them root-pruning and fruit-growing, and that sort of thing?—My experience has rather been the contrary of that, because it was not appreciated where it was tested.

12694. It is just possible it could have been placed before them in an improved way?—Most decidedly. It was in a most crude way that it was put before them.

12695. Then I suppose we may take it for granted that that applies all round to scientific education?—No, I would not say that.

12696. But the better it is placed before the students the better chance it has of having a good effect?—Undoubtedly so, but I did not quite catch, I think, the meaning of your first question.

12697. I mean to say that almost all the failures in this instruction have arisen from the fault of putting the wrong instructor in the wrong place?—Yes.

12698. Then a few words with regard to manual instruction. You were speaking of sheep-shearing in the South of Dorset. Are not they very celebrated for sheep-shearing there?—I do not know that it is so any more than in any other county. I should not say so, but I have had no experience of other counties. But I should not have thought so. I should think that sheep-shearing was one of those things which men take up. But it has dropped out a great deal, because a great many now clip their sheep by machinery.

12699. But there is a greater interest, I mean, taken in it in the South of Dorset than in the North of Dorset?—I could not say yes or no to that.

12700. But that is the real reason why the manual instruction is taken more interest in in South Dorset—it is that there is a better class of man?—Most of us have our sheep shorn with shears, though a few adopt the other method. I should never have my sheep shorn with machinery so long as I could get shearers.

12701. Do you have hedging and thatching?—Take a person in my district. A pupil comes and thatches a rick for me without anyone with him, and then the Education Committee appoint a person who comes round and inspects the rick, and if the rick is worthy of a prize they give him a prize, and if not he does not have anything.

12702. That means that all this teaching is subject to competition?—No, the thatching is not necessarily subject to competition. I think I am right in saying that they will give a prize for any rick thatched by a pupil, provided it is satisfactorily done.

12703. It is all subject to some recommendation of his services, is it not?—Yes, decidedly so.

12704. And is hedging the same?—Hedging is competitive.

12705. Are there any thatchers who take pupils?—Yes, there are thatchers.

12706. Who are they?—Anyone on the farm. My thatcher, for instance, would take a pupil, and I know this was done. He went and saw one rick thatched, and that is his qualification. As thatcher he gets 10s.

12707. That means that all the people in your county virtually are encouraged to impart their knowledge to the juniors?—That is so.

12708. Now with regard to the management of sheep. How do you teach that, because that is important?—That is the most important thing which you can mention with regard to manual labour. It is a very difficult question as to managing it. The competition is in regard to several things. First, they would consider so many points for the larger rearage of lambs, which I do not consider myself to be any criterion of the value of the shepherd, because the rearage of lambs depends very much indeed on the owner of the sheep, as to whether he is a liberal keeper and a good manager. But the great point a shepherd should know, and which marks his intelligence generally, is how to move his field regularly, and move his crosses, and so on, and general tidiness and neatness and cleanliness, and so on. But I do not mean to say a number of lambs reared over and above the number is not an advantage, but it is not so great an advantage as a good knowledge of his work.

12709. (*By Lord Barnard.*) Is it desirable to provide general instruction for shepherds?—Yes, I think it is very necessary, and I think it is money well laid out.

12710. (*By Mr. Latham.*) I am a very large owner of sheep myself, and I find if they are not properly attended to when young, it is no use tying them in, however good the shepherd is, if he cannot manage?—Yes, if he has not intelligence he will not look to them when they are born or when young.

12711. But a thoroughly good intelligent man shows himself specially well in bringing up two lambs to a ewe instead of one?—Yes, I quite agree with that; and as you know a great deal about sheep you will know that a man that will feed £500 or £600's worth of purchased food a flock of 500 ewes would be expected to rear more lambs than a man who starves them.

12712. I quite agree, but as to providing material for a large number of lambs, it is a thing in his favour, and must mean intelligence?—Yes.

12713. Then next, I cannot see any advantage in teaching a man to mow by scythe?—No, I cannot either.

12714. (*By Lord Barnard.*) But you have put it down in your *précis*?—It is only as one of the things that is supported in our county, but I do not agree with it.

12715. (*By Mr. Latham.*) How do you encourage turnip-hoeing?—There is a field selected, and the competitors enter. I have never attended one, but they have a quarter of an acre each. But I am not very much wrapped up in that either.

12716. Have you a teacher in the ploughing matches?—They have not, I think, held any ploughing matches for several years.

Mr. C. B.
Stiby.

2 July, 1907.

12717. With regard to all these subjects, except sheep-shearing, are not they subjects the agriculturist should teach his men, and not ask the county to do it?—I quite agree with that.

12718. That makes me feel as an agriculturist that the master is not so good a man as he ought to be?—I quite agree with you.

12719. And that these things should be taught by the agriculturist and not by the public authority?—Yes, I quite agree with you; but my Committee would not agree with you. You must take that as a personal remark.

12720. (By Mr. Medd.) In the *précis* issued by your Committee they state they would like to have four secondary schools with agricultural sides. Did they give you any idea of what they intended?—Simply to follow on what is adopted already.

12721. One for each division in the county?—Yes.

12722. What did they intend to do?—To give the boys who intended to follow agriculture a better start, a better knowledge.

12723. How were they to get it? How was the instruction to be provided?—By an instructor.

12724. Purely with, or without land attached?—Without land, although they have had a bit of land lately.

12725. Was there to be any practical instruction in agriculture?—No, not beyond this, that they would have the opportunity of going over an adjacent farm to see the operations, and have them explained to them by the instructor.

12726. You have explained your disagreement with one item here, and perhaps I may say that no school in England attempted on that scale has succeeded?—I am afraid I do not understand the question.

12727. What school of that kind has succeeded?—I am not quite sure of your question as to what is meant by disagreement. I do not think I have said that.

12728. You have described that one item here that Mr. Latham asked you about, and you said that it was not a recommendation of yours but of the Committee's?—Of what point do you speak?

12729. Mowing by scythe?—Yes, but that would not apply to an agricultural pupil.

12730. No, I meant only an analogy. But I mean in one's experience no school with an agricultural side, so called, succeeds, and can you tell me of any one that does?—I am not prepared at the present moment to do so.

12731. It is the recommendation of your Committee but you cannot tell me of one?—No, I cannot tell you, except that I quote from a report made to us by the Board of Agriculture Inspector. He says he considers the Beaminster school good, but I said I had not sufficient experience of Beaminster school to say whether it has been a success or not.

12732. My experience has been that there has been none because the one that succeeds is misnamed. Now, in your rough estimate of expenditure on horticulture, you account for £338?—I do not think it is so much as that, £137 I think I said.

12733. It is £338?—Where did you get those figures from, may I ask?

12734. In the Board of Agriculture Report it says, under horticulture: "Dorsetshire, £338"?—I am very sorry so much money has been squandered.

12735. You cannot tell me how it has been spent?—No, I cannot, except that the salary was, I think, £180 for horticulture.

12736. Perhaps in your county, as in so many others, a good deal goes in administration which is unnecessary, but in any case you are not, speaking officially, capable of telling me how much has been expended?—First of all, I cannot admit that that has been spent. The dairy instruction is £337, but the horticultural was £127, including expenses.

12737. But that is given in the official paper, unless I am reading it quite wrongly?—There must be some mistake somewhere.

12738. It does not much matter. The only point is in reference to your school gardening. You have felt a certain disinclination to approve of it hitherto?—The school gardening does not come out of our funds. It comes direct from the Board of Education as a grant.

12739. You do not add any money to it, do you?—

No, I think we get £29 or £30, and that comes direct from the Board of Education.

12740. You have not expended anything upon the training of teachers, have you?—No, nothing that I am aware of.

12741. When the map on that wall was drawn up, and also when these statistics were published in 1907, you were allied to Reading?—Yes.

12742. Why did you discontinue that?—Now I can scarcely answer that question, except by saying that we had no pupils to send.

12743. I will not press that particular question as to why you did that?—I think we gave a contribution of £73 a year, but perhaps you can correct me there if I am wrong. I am inclined to think we gave a contribution of £73 a year, for which we received certain statistics.

12744. It was £106?—No, we did not contribute so much as that, I think.

12745. Here it is certainly; Dorsetshire, £106, out of your £7,000. But it is immaterial to my question what you expended. But you did expend something, did you not?—We did, certainly.

12746. Have you had any connection with the school at Dauntsey?—I was not aware that we had, but I have found since that we have had connection with it, and sent pupils there.

12747. Have you any knowledge of the school at, Dauntsey?—Not any personal knowledge of it.

12748. One is of rather a different type from the other, and I wish you now to account for your dissociation from Reading?—By a comparison of the two schools?

12749. Yes, by a comparison of the two schools, and you cannot tell me?—No, I cannot. The one is more practical than the other.

12750. Lord Barnard has very kindly placed in my hands this publication, by which I see you contributed £400 a year to Reading, which is considerably more than my statistics. My statistics were £106, and you do not, know of any reason, speaking just as a practical man, and not as a witness here arguing the case, why you were dissatisfied with Reading?—I do not think we were dissatisfied. I think it was a question of funds. I think I said before that it was a question of finance.

12751. You got no benefit from it?—No, I would not say that. But then there were so many other things in education that it was as necessary to, as they considered, as spending on other subjects.

12752. When I find you disagree with me as to the grant on horticulture, which I find is down here at £388 and the dairying industry at £449, it is difficult to see exactly how you distribute that money beneficially for the county?—Of course if you have that authentic as to the £388, I must not contradict it, of course.

12753. Probably I have made a mistake here, but this is this year's return (*handing return to the Witness*)?—I should not think of looking at it if you state it.

12754. But I may have got the wrong county, or some mistake may be made?—I think our instructor is salaried at £127. Now this brings it to my recollection, and that is why we particularly objected to horticulture. One objection was that the travelling expenses came to such a large sum of money.

12755. I agree with you there. The cost of administration, the cost of transporting your lecturers, and the cost of maintaining your office, seriously hampers you?—That is where the money was spent. When you mentioned the subject first I was only thinking of his salary.

12756. Then I think my figures are right?—Yes. That is one of the objections which we had to horticulture—that the expense was so heavy in administration only.

12757. There was a different method to be found for the expenditure, and primarily do not you think the elementary school affords the best means of, so to say, initiating the child into nature?—That is my opinion.

12758. You think so?—I do think so.

12759. You think you would get a child who understands nature more, and whose powers of observation are developed more?—Yes.

12760. Whatever his sphere in life may be?—Yes, that is my idea.

12761. Now we come to this, that in Dorsetshire you have not yourself any grade for the agriculturist of higher type?—No, none.

Mr. C. B.
Stibbs.
—
2 July, 1907.
—

12762. There are higher elementary schools, and those higher elementary schools can be established anywhere, giving at the same time for those who require them commercial or business instruction, and for those who require it agricultural instruction; and they take those boys from the age they leave the elementary school up to the age of 15 or 16. Now, do not you believe that schools of that type might help you to carry on your elementary school boys up to a certain point?—Not one iota, and I will tell you why, if I may give my reason for saying that.

12763. Yes, do so?—First of all, in the elementary school you would not get a parent who was in a position to support his son as an agriculturist or in any other of the higher classes of business, or he would not send him to an elementary school, but to a secondary school. Secondly, as to a boy who went to an elementary school because he could not afford to go to a secondary school, it would be throwing it away, because he would have no capital to invest in that branch of farming which he would be taught, supposing he could be taught.

12764. Your reasons are common reasons often urged; but the fact is that your secondary school with an agricultural side to it is educationally impossible. Your higher elementary school, which carries the boy on to 15, is in a position to combine agriculture with general education?—I do not think so.

12765. But it does where it exists?—I cannot agree with you.

12766. I know that, and you are quite right not to agree, but then you come to this, that that is a possibility which is eliminated from Dorsetshire? Now in Dorsetshire you are not far from Wiltshire, are you?—No, we border on it.

12767. You have got the Dauntsey School, available for your agricultural boys, existing there?—Yes.

12768. That is for those who wish to proceed up to the age of 16 or 17 in agriculture?—Yes.

12769. Those who want to proceed to the higher stage in agriculture you have Cirencester available for?—Yes. You are speaking now of secondary schools, are you?

12770. Yes. Dauntsey is a secondary school; only it is an agricultural and not a pure secondary school?—No.

12771. It is a school for the sons of farmers up to 16 or 17 years of age?—Yes.

12772. Then you have Cirencester, which will take you up to the position of the Professor of Agriculture, or the man of research, to the very highest type?—Yes.

12773. Now do not you think that if your three counties combined you would economise a good deal of money, and you would be able to bring a great deal more pressure to bear upon both the Board of Agriculture and upon the Government than you can do working in isolation? Each of you would be providing what the other has not got. We have not in Gloucestershire anything like Dauntsey. The very best boys at Dauntsey would come on to us, coming by scholarships. As to your best boys whom you have in these excellent itinerant classes, and so forth, it might be worth while for them to have a scholarship and go for a couple of years to Dauntsey. But you have nothing to send them to at present?—You have asked me

a question which requires too much consideration to answer right off on the spur of the moment, because there are a great many combinations which are not successful or practicable. It is too difficult a question for me to give an answer to straight off.

12774. Now will you look at the map and see how the three counties, Dorset, Wiltshire and Gloucestershire, might combine. They run in a straight line, and you have got excellent communication now from Dorset up to Gloucester, and you have got the intermediate school. You would have everything then. You would have your itinerant classes, your butter classes and your elementary gardens, and so forth, all going on in Dorset, and you would save all the expense of what I may call intermediate agricultural education, because you would get it at Dauntsey; and again for those whom you wished to appoint to the highest positions and so on, you would go on to Cirencester. I do not ask you to give me any answer, but that is a sort of idea to mark it by. You see on that map how England is marked with yellow and pink and blue, and brown, and green in Wales, and all those counties are co-operating and saving themselves, I may say, £6,000 a year by utilising each other for certain purposes. It is impossible, in fact, for every county to maintain a Dauntsey or for every county to maintain a Cirencester, and so on, and what one wants is a combination of counties which will enable these institutions with Government aid to be serving the whole of the particular area—some of your Dorset pupils coming up to us at Cirencester with scholarships and some of your Dorset pupils going up to Dauntsey with scholarships, and so on?—Would that not be curtailing the general advantage for the benefit of a few?

12775. No, I do not think so; you would find, as a matter of fact, I think, that it would not increase your expenditure upon agriculture one iota—at least, I am sure it would not?—If I understand it rightly, when I get home I will think this over. What I understand your theory to be is this, that instead of having any agricultural side to any secondary schools, you would send the boys wanting to learn agriculture straight to Dauntsey?

12776. Yes?—But there must be a limited number, I take it.

12777. Yes, that would be a matter for arrangement with you and Wiltshire?—Yes; and from there, if there were any boys of special ability, they would come on to Cirencester.

12778. That is the idea?—That is the idea, and there are lots of things I should like very much indeed to put before our Chairman and one or two others who are competent to assist me in the matter.

12779. I wish you would do so. Colonel Williams might help you with the idea. Is he on your Committee?—Yes, and I know him personally.

12780. You understand what I mean?—Yes, I do, and I can put it before some members of the Committee who feel interested in it.

12781. (By Lord Barnard.) You quite understand that any suggestions which have come from Mr. Medd come from him and not from the Committee?—I quite understand that.

Mr. CHRISTOPHER MIDDLETON called and examined.

12782. (By Lord Barnard.) You are honorary secretary of the Cleveland Chamber of Agriculture?—Yes.

12783. And I think you are a member of the Council of the Royal Agricultural Society?—Yes.

12784. And you have been very much mixed up with farming for many years?—More so than with education.

12785. Do you farm yourself?—I have farmed up till five years ago.

12786. In the North Riding?—In the North Riding all my life.

12787. Are you at present a member of the North Riding County Council?—No, I am not. I have never been on the County Council.

12788. I see you speak in your *précis* of this district and are you speaking principally for the North Riding or South Durham, or what?—Both the North Riding and South Durham.

12789. I should like before asking you any other questions, in order to prevent any misapprehension, to remind you of the terms of the reference to us, with which I daresay you are acquainted, because it seems to me you may have a little wandered from it in the first three paragraphs out of five in your *précis*. You refer to the education of the sons of farmers, but you will bear in mind that we have nothing whatever to do with the education of the sons of farmers unless they are going to be farmers?—I am speaking entirely of those who intend to be farmers.

12790. We are dealing with scientific and technical instruction in agriculture?—Any evidence I give is directed to the sons of smaller farmers who have not yet taken advantage of, or been able to take advantage of, the facilities already afforded.

12791. But our enquiry includes the sons of men who may not be farmers at all?—I quite grasp that. I do not restrict it to those merely who are the sons of farmers, but include anyone who intends to farm.

Mr. C.
Middleton.
—

Mr. C.
Middleton.

2 July, 1907.

12792. You are well acquainted, I daresay, with the facilities which already exist in the district, are you ?—I do not think there is any lack of facilities for the sons of men of any means at all. They can be educated. There is the North Eastern Counties School, for instance, which has an agricultural side.

12793. That is a secondary school with an agricultural side ?—Yes. Then, of course, there is the Armstrong College at Newcastle and the Leeds University.

12794. Are you familiar with Leeds and Newcastle, and do you often go to those places ?—I have been several times to both of them.

12795. And you have seen the work carried on there ?—Yes.

12796. And the experimental work at Cockle Park ?—Yes. I may say that very shortly I shall be organising a party of members of my Chamber to visit Cockle Park.

12797. Have you been there before ?—Not with a party from my own Chamber, but last year we took a party to the Yorkshire farm at Garforth.

12798. But you have been to Cockle Park ?—I have been to Cockle Park.

12799. Is it your experience that farmers appreciate those visits ?—Most decidedly.

12800. They are beginning to find out that they can get some advantage from them ?—Last year I took a party of 30 members of my Chamber to Garforth, and they were so much pleased that they asked me to arrange for a visit to Cockle Park this summer.

12801. We have had a good deal of information from those places, and I will not take you through them all except to ask you if you are personally acquainted with them ?—Yes.

12802. You have something to say, I think, upon education for the sons of smaller men who are farmers. On their leaving school, what do you say as to the facilities which exist for them ?—There are facilities both in Durham and Yorkshire. They may get exhibitions to go either to Leeds or to Newcastle, but as a rule I think those are generally taken by boys when they leave school. But I do not think that is the best age for them to have this instruction. Probably they will have to submit themselves to a qualifying examination before they get an exhibition, and possibly after working two or three years on the farm it may not be easy to pass such an examination, but I think this practical work would be a decided advantage before having the scientific training.

12803. I think I am right in saying that with the exception of some of the larger men, the farmers' sons in South Durham and North Yorkshire usually only go to the public elementary school, do they not ?—Yes, the smaller farmers' sons do.

12804. They do not often go to the secondary school ?—No. I know a few comparatively small farmers who send their boys to the North Eastern Counties School at Barnard Castle—men who can scarcely afford it, but they see the advantage, and strain a point to enable them to do so.

12805. That school provides an education at considerably less than cost price, does it not ?—I am aware of that.

12806. In consequence, firstly, of very large charitable foundations, and, secondly, because of the very munificent contributions made by the landowners of the three Northern counties ?—That is so.

12807. What would your suggestion be then for giving a better education for the young men of those humbler classes ?—I will take Leeds, in Yorkshire, first. They have a course of three years and they have also a two years' course, but I do not think there is a course specially adapted for those who can only spend one winter, and I think it would be a great advantage if a special course could be arranged by which those who can only spend one winter there shall have as much education given to them as is possible to get in the time. At present the course is adapted to be followed on by a second year's course ; and I believe also at Newcastle there is no particular course which is compressed into a single winter session.

12808. I think we have that, if you will pardon my saying so. We have a short winter session course ?—I know there is the six weeks' course, but what I want is the winter course of five months. The six weeks' course is scarcely sufficient.

12809. You want something more than that ?—Yes, I want something more than that.

12810. About five months, do you think ?—That is the

time taken up at Leeds, from the middle of October to the middle of March.

12811. How do you think those lads should go ? Should they get scholarships from their County Council to those courses ?—I do not see how else it could be arranged very well for them, except in that way.

12812. Perhaps you will agree with what several other witnesses have told us, that is, that not only must the lad have money enough to pay for his board and lodging while at Leeds or Newcastle, but you must to some extent compensate the father for the loss of his work during that period ?—No, I should not go so far as that. It is not reasonable. Unless the father is prepared to make some sacrifice, he cannot expect his son to be educated in that way.

12813. Then what do you think of the lectures ?—I have a very high opinion of the lectures, but possibly it may be because in Yorkshire we have been singularly fortunate in having a very practical lecturer. I do not want to mention names, but he is a man who possibly has not the academic qualifications that some men have, and with no letters after his name, but he is a man who has a thorough grasp of the subject, and is able to give lectures in such a practical way that he interests his clients. I know for a good many winters in my parish, when farming in Yorkshire, we organised a course of lectures, and we always made it a stipulation that these lectures must be given by a certain lecturer, and in fact as the course went on his class always maintained the interest to the end. In fact, more attended during the last months than the earlier ones. People joined on. I cannot speak too highly of the good result that ensued to the young farmers who attended his classes.

12814. Have you had any experience of experimental plots ?—No. I have seen them, but have not had anything to do with carrying them on.

12815. You have visited them ?—Yes.

12816. Do you think they are of value ?—Very great value indeed.

12817. Would you agree with the opinion that has been expressed that that experimental work should be carried on on a national system, that is to say, to some extent directed from a headquarters somewhere to prevent overlapping ?—I cannot say that I fell in with the proposition that was put forward by the Board of Agriculture some time ago, because I think it would have interfered with some very good work that is being done in different localities. Each locality knows its own needs best. I am in favour of there being some national system, but not that the whole should become nationalised.

12818. (*By Professor Middleton.*) What proposition was that, may I ask ?—It was one that came from the Board of Agriculture.

12819. (*By Lord Barnard.*) You are referring to the particular proposal for a national council of research ?—Yes.

12820. That is supposed to be a little outside the scope of our enquiry. We have had evidence on a great many other subjects, and I will just mention them in order that if you wish to express an opinion on them you may do so. There is the migratory dairy schools and dairy instruction ?—Yes, I know in my own district we have had migratory instruction in butter making. Of late years it has rather lost interest because so many people who went in for it have now gone in for milk selling, and it is not so necessary in the district in which I have always farmed.

12821. Then poultry keeping ?—Yes, we have had poultry lectures which were very well attended by the wives and daughters of farmers.

12822. Did they derive any pecuniary benefit ?—I think so.

12823. You think they got better prices ?—I am certain from the information they got they have got better results both in the way of getting a greater number of eggs and getting better fowls and better flesh producers. In every way they have benefited by them.

12824. Then as to farriery, have you any opinion on that subject ?—No, we have not tried that, but we have had veterinary lectures which were of very great value and very popular with the farmers.

12825. Then horticulture, is there much done in that way ?—I cannot say. I do not know that. I have never had anything to do with that.

12826. Yours is not a good gardening district, is it ?—No.

Mr. C.
Middleton.

2 July, 1907.

12827. The spring and early summer are too severe?—Horticulture has not been taken up anywhere round my district.

12828. Then there are the manual processes, that is to say, hedging and ditching and sheep shearing, and those sort of things. Have you had anything done in that direction?—No, but I should be glad to see some effort made in that direction, because I always feel that when the present generation of labourers has died out, I do not know how the skilled work of the farm is going to be done.

12829. A great many of them in your district are not very skilled now, are they?—That was one of my great difficulties when I gave up farming, and one of the reasons I put forward to prevent my boys from becoming farmers was because it was so difficult to get farm work done.

12830. All the more intelligent lads go into the ship yards and smelting works, and so on, do they not?—For the last fifteen years I was farming I never was able to get a boy at all. They went into offices. For a local reason they were able to get into the office of a very large firm in the district, and every boy made it his object in life to get to a stool in their office.

12831. But the result is rather disastrous for farming, is it not?—Very much so, I consider.

12832. Do you think anything can be done in the way of giving farm hands instruction?—I think the best way of doing that would be by giving prizes. That is being done to some extent in the way of giving prizes for hedge cutting and that kind of work already.

12833. Do you think the elements of veterinary science is a useful subject too?—Very useful indeed when given by practical men.

12834. Then there is bee keeping, and perhaps to a small extent fruit growing?—It might be useful.

12835. Bee keeping is a considerable industry of course?—Yes, and I suppose it is profitable.

12836. Then there are school gardens. Have any of the schools in your part of the country gardens?—I do not know any that have gardens attached to them.

12837. Then, winding up this very long list, I will ask you your opinion as to the funds that can be provided to carry on all this work. You know farmers and land-owners pretty well?—Yes.

12838. You know, then, that it is almost impossible to expect that funds in any substantial amount can be obtained from those sources?—Yes, I do not see how you can get very much more from them. I fancy farmers are right in saying that they contribute so much to the cost of education that they should participate to a greater extent than they have done in the benefits to be derived from it, but I do not quite see how that is to be brought about.

12839. You think the State ought to do more for the agricultural industry in the way of providing information and instruction than it does?—I would go a little further than that and say that education is a national object, and to a very great extent should be paid for out of national funds. But I am afraid the day is far distant when that will be done.

12840. But I am rather keeping the question of education in that respect in the background. I am referring to what I might more properly call instruction than education, that is to say, the obtaining and diffusion of all knowledge which is useful in the technical processes of agriculture?—It will have to be done through the County Councils to a great extent.

12841. You have told us you are not on the County Council, but we have been told, and perhaps you have heard it, and I know it is so in the North Riding, that the County Councils are at their wits' end how to manage with the money at their disposal for educational purposes and how to find it sufficient?—I think the North Riding County Council are rather chary in their expenditure. They might be a little more liberal I think.

12842. But still you would not get any substantial sum from the North Riding, would you?—No, I do not think so.

12843. In fact you look upon it as the duty of the State?—Yes, I think so, and probably the grant from the Board of Agriculture for that purpose ought to be very largely increased, and I think probably it would be best if the funds came through them.

12844. Many witnesses have suggested that although they might, of course, have a certain voice in controlling the funds which they obtain, yet that the actual work should be done by the County Councils. That would be

your opinion, I think?—Yes. It must be done locally. It can scarcely be carried on from a head office.

12845. Then on a topic which is properly speaking, like research, outside the scope of our enquiry, that is, the subject of elementary education, you have put a note here in your *précis* on that, and will you give us your opinion on that?—I should like to see the boys in rural districts have the chance of learning nature study and other things, which would probably induce many to stay on the land. If they were interested in these subjects before leaving school they might stay on the land, but I am sorry to say that the education which is given in many elementary schools is such as to give them an entire distaste for country life, and I am afraid many of the teachers rather encourage the distaste for country life.

12846. Are there any other subjects you would like to mention. You have not mentioned the subject of forestry, have you?—No, I have not sufficient acquaintance with that subject.

12847. (By Professor Middleton.) Your opinion is that the colleges do not provide the exact course that is required for the sons of small farmers in the North of England, is it?—No, I do not think they do. I think the course is more adapted to those who have large farms, or who are going to take up instruction work, or land agency.

12848. Your complaint is that on the one hand the course provided for the small farmer is too short?—The six weeks' course is too short.

12849. And that the other courses are too elaborate?—Yes.

12850. Your suggestion is that there should be a single course extending over the winter of five months?—Yes.

12851. Have you thought at all what that course should consist of? Would you make a selection of classes out of those which already exist, or would you like to have a specially constructed course?—If it could be arranged, I think I should have a specially constructed course.

12852. There comes in the difficulty, that all the colleges are willing to offer a selection of classes, and any of them would permit the students to come for the five winter months to a selected group of classes, but those selections are not very popular with students and they are not very well adapted for the students' purposes. In order to get a five months' course of the type that he really wants you would have to have a specially constructed course?—Yes, I think it would have to be a specially constructed course to answer the purpose.

12853. Then that means, of course, fresh classes?—Yes.

12854. In every one of the subjects?—Yes.

12855. And a great difficulty is that the teachers cannot find time for so many separate classes, and so it is impossible to work the new classes into the timetable?—My hope would be that they would be attended in such numbers that fresh instructors would have to be arranged for.

12856. To make it worth while taking it up?—Yes.

12857. The farmers' son would need to show some greater keenness for education before that time comes. He is not at present going to the college in such numbers as to warrant that?—That is so. The farmers up to now have not availed themselves to the extent that they should have done of existing facilities, but possibly for one thing it is not made sufficiently known, and some of those who do realise the advantages of it think that the course is too long and that the course is not adapted quite to their requirements.

12858. I think I may say that all the institutions that have tried the short course would be willing to develop that short course if they could get the students to come back in numbers. They have tried it in certain institutions. At Newcastle I think they have. They had 20 only, but that is not at all a satisfactory number. If you asked the best out of those 20 to come back, or if you enquired how many would come back, perhaps not more than five would be willing to return?—Their fathers, perhaps, would keep them back. It is probable the fault is with them.

12859. From my knowledge of the subject, I should say the colleges are ready to provide that course that you ask for, but that they cannot get a sufficient number of pupils to warrant them in providing it?—I do not know whether all the exhibitions offered by the North Riding County Council are taken up. I scarcely think they are, and it is scarcely sufficiently known. Many farmers do not know, I am certain, that these exhibitions are available.

Mr. C.
Middleton.
—
2 July, 1907.
—

12860. Then in reference to one remark you made in reply to Lord Barnard. You gave a very decided opinion that there should be nothing given in the way of compensation to the farmer for the loss of the time of his son?—Most decidedly.

12861. Would you not agree that, on the contrary, the father ought to pay at least something?—I should say it does cost a little already. The tuition fees are paid, and there is a contribution towards the cost of board and lodging, but I do not know whether it quite covers the expense. I should say it does involve a small pecuniary sacrifice on the father's part.

12862. Do you not think in the long run the education might be more popular if it involved some little struggle on the part of the parents?—To some extent, perhaps—I do not say that I would press to have it absolutely free, but it should cost very little to the parent.

12863. Would you justify expenditure on agricultural education because of the large sum which agriculture contributes to the rates?—I think that gives them a fair claim on the public purse. May I just say one thing further? During the examination of the previous witness I rather gathered that the feeling of the Committee was against secondary schools having an agricultural side to them.

12864. (*By Lord Barnard.*) No, I do not think you must go so far as that. The feeling of the Committee, I think, is that we have never had any absolute proof of its being a great success before us. We want very much to hear of a case where it has been a success?—Take the case of the North Eastern Counties School. It has not been the success one would have imagined it would have been but the boys who have not the opportunity of going on to an agricultural college have got some useful instruction there.

12865. I quite agree, but at the same time for some years past the Governors have had to consider whether that side could be carried on, and it is doubtful as to its continuance. But after all, that is only one case, and we should like to know if there are others. We should like to see that extended instead of restricting it?—I have been rather surprised and disappointed that more boys at the school are not on the agricultural side, especially as many of them are not able to go on to the college afterwards.

12866. (*By Mr. Latham.*) I think you made the remark just now that you thought if boys could go for two or three years back on the farm before they got this extra education it would be an advantage?—I think they would be better fitted to get the full benefit from the technical teaching after they have had some practical training.

12867. But on the other hand, do you not think the very fact of being in the open air and on the farm would lessen their keenness for this technical college?—Not if they were the right kind of boys.

12868. Then as to these short courses of five and six months, were they for boys from the elementary schools or from the secondary schools?—For any boy who was going to make farming his occupation.

12869. How were they to get these courses?—I suppose the County Council would have to give exhibitions to them, as they do now, as to a certain number, but they would have to give a greater number.

12870. Then you made the remark that you thought these exhibitions and scholarships were very badly known?—Yes, they are not generally known amongst farmers.

12871. They are not advertised by the authorities, are they?—I believe they are advertised, but many farmers have never seen them and do not know of their existence.

12872. It has been suggested in this room several times that agricultural committees in counties would be of very great value if they worked in connection with the County Councils. Do you think they would be of that advantage?—They might make known to the farmers each in their own district what facilities were open to them.

12873. But would not in all probability the wants of the farmer get better known if there were such things as agricultural committees?—I think so. I think they might be of great advantage.

12874. With regard to the paragraph at the bottom of your proof, which I very much agree with, I should very much like you to state shortly how you think it possible under the present circumstances that any more money could get into the hands of agricultural educationalists?—The Treasury is very difficult to get money from.

12875. But would your answer be that it would be a valuable thing for us to press the Treasury to try and get

more money?—I think if the Board of Agriculture were to press for it it would be better.

12876. But we are sitting here to assist the Board of Agriculture?—I hope, then, the report of your Committee will enable the Board to get an increased grant from the Treasury.

12877. That is what you mean here?—Yes. Some counties might do more than they do. I understand a good deal of the "whisky money" is not devoted to that which it might be, and which is intended for technical education, but part is going to relieve the rates instead of being spent as it was intended to be spent.

12878. We might take it for granted that there is a great deal of the "whisky money" at the present moment going to relieve the rates, because it is being allocated to secondary education through the Act of 1902. The ordinary evidence we have got generally is that County Councils are drawing back from agricultural education in consequence of the "whisky money" going to the rates indirectly. Witnesses think it does not go directly, because the rates would be very much increased if the "whisky money" was given for agricultural education. Then, again, your remark here applies very forcibly?—I understand there is a great difference in counties. Some counties do allocate a proper proportion to technical education, and others do not. Practically it nearly all goes to the relief of the rates.

12879. Then it would be very much better if the Board of Agriculture could have more power over this money that is now supposed to be used for agricultural education?—Yes, I think it would be an advantage if the Board of Agriculture could see that this money is devoted to the purpose for which it was intended.

12880. Do you not think agricultural teaching would be better for the agricultural interest if it was entirely in the hands of the Board of Agriculture?—I do not know that. I should scarcely be prepared to go so far as that, because certain districts have organised themselves well, and I do not know that there would be much improvement by them being controlled by the Board.

12881. But the very fact of this quinquennial division must help you in your answer?—I suppose the Board in those instances in which they make a grant directly or indirectly do have some control of some sort. I suppose that would be a condition of the grant, that they shall comply with certain conditions.

12882. We may fairly take it that you consider the amount of money which the Board of Agriculture has to use for the benefit of agriculture is much too small?—Very much too small.

12883. (*By Mr. Medd.*) Are you not a member of the Education Committee of the Royal Agricultural Society?—No, I am not on that committee.

12884. You know that that Committee, of course, has its educational exhibition annually?—Yes.

12885. Then do you not think that the organisation of that show might be better if it were entirely in the hands of the Committee of the Royal than distributed over a number of different societies?—I think the show depends on the co-operation of different societies.

12886. Yes, they can co-operate with and under you, but it seems to me that when we have the County Councils' Association and the Agricultural Education Association and so forth, there is a liability to have overlapping and waste of effort and loss of prestige, and that if you undertook it with our co-operation, the position would be improved?—I am afraid the Committee would scarcely be willing to take the whole of the responsibility upon themselves.

12887. That is what Lord Moreton says?—I am very much of that opinion.

12888. It is a question of increased responsibility on your part?—Yes. The Society is responsible for a certain proportion of that. From Woburn there is a certain amount comes, and I think it is more to their interest in the way it is done now—with the co-operation of various other bodies.

12889. You speak with far greater knowledge of the practice than I do, but I should have thought from what I have seen of the shows that there was a certain amount of dislocation and a certain overlapping, and that there was a waste of money, so to say, in bringing to the show similar examples of various types, but that is a matter of opinion?—I think it is better to have a little overlapping, otherwise there would be a good deal of omissions if it was left entirely to one.

Mr. C.
Middleton.
—
2 July, 1907.
—

12890. If you are content to go on with the trouble of it all, well and good. Now in regard to your own county, is that Yorkshire?—Yorkshire and South Durham. I am living in South Durham now.

12891. In regard to Yorkshire, have you any knowledge of the work done at Beverley in their meetings and so on?—No, that is the East Riding.

12892. That would not come within your sphere of operations?—No.

12893. (*By Lord Barnard.*) One question arising out of some of Mr. Medd's questions. One member of the Committee here has expressed a very strong opinion that what are known as agricultural societies ought to do a great deal more for agriculture than merely organise a show. Do you think that anything more could be done through them?—There are very few agricultural societies which could or would do very much, I am afraid.

12894. They practically are not agricultural societies at all, are they?—They are more show societies.

12895. They are managing committees of the show?—Their sole object is their annual show and they do not exist really for any other purpose.

12896. You think they could not be made useful for any other purpose, do you?—I think county agricultural societies might be made more useful, but I do not think the district ones want to. The county ones might if they were willing.

12897. I know the good work done by the Darlington and Stockton and Cleveland Chambers of Agriculture, and might not some of these societies on a much smaller scale produce similar work?—It always seems to me, like two societies doing the same work in a district, and I think, perhaps, it is well that chambers of agriculture should stick to their own work and not take up the province of others.

12898. (*By Mr. Medd.*) Then, if I may make the remark, is not that exactly what I advocate in regard to the Royal Agricultural Society and its control over its own educational section?—But would not that involve leaving in their hands the whole preparation, which is excessive?

12899. No, I do not think so, but the difficulty is that taking the present area, a great number of societies apply to possible exhibitors, and it is a great deal a question of prestige as to which they will go to and so on, and what I want to see is what you may call a quinquennial exhibit of an area. You are moving about and next year you will be at Newcastle, and then I would have what Newcastle has to show, and if it comes south, what they have to show there. Take this year at Lincoln. Cambridge flatly refuses to show a thing because they showed somewhere else, and from the point of view of farming and the

elementary teaching point, have you more to show than any other county? That is the difficulty that arises, and could your Committee not alter it?—It has become a very interesting feature of the Royal Show, and I should be sorry to do anything to risk lessening it.

12900. I know it has done excellently. The only thing is the fear of local overlapping?—I believe in letting well alone. I think it is fairly satisfactory at present.

12901. You do still draw from a wide area. The difficulty is that you are now attempting to draw from areas from which other competing societies draw?—It is quite voluntary on their part, and we cannot compel them.

12902. But if the Royal Agricultural Society had the prestige of being the chief quinquennial exhibitor of the kind in a given area, it would receive from that area all the best exhibits?—I do not know about that.

12902a. (*By Mr. Latham.*) You know that there was a very scientific exhibition at the Royal Agricultural Society the last two years?—Yes, for about four years, I think it is.

12903. There is a very great interest taken in it?—Yes.

12904. Would it be possible for your Society to try and institute lectures on these different exhibits, to young farmers particularly: because I do not think you need be aggrieved by my making use of the expression that they are quite ignorant of the nature of the exhibition?—That would rather exclude people coming into the show and seeing all there was to be seen, and I do not think that that is practicable. It would require a very much larger space, because it is generally crowded as it is.

12905. Does not that show the necessity of your going further than you do go?—I do not see it. I do not know whether you would get space enough to make it worth while having lectures. Certainly hundreds would want to attend them.

12906. Has it ever struck you as a Society that it would be worth while making a small charge to admit people now?—I think there would be an objection to there being any further payment to make when you once have got inside.

12907. But, still, there is a very great deal in this scientific exhibition which is very much misconstrued, and not at all understood by agriculturists generally?—I will consider that point, and if I come round to your way of thinking I will bring it forward at the Council. I will consider it, but it has never occurred to me yet, and I would not like to form an opinion without full consideration.

12908. You said you would be very fond of letting well alone, but you would not object to improving well?—Not if I was sure it was an improvement.

Mr. ALBERT WHEATLEY, F.R.C.V.S., called and examined.

12909. (*By Lord Barnard.*) You are a Fellow of the Royal College of Veterinary Surgeons?—Yes.

12910. I have not got a note of your evidence?—No, I have not sent in one.

12911. You know the reference to this Committee?—Yes.

12912. Have you any views or information on that subject which you would wish to communicate to us?—Only in reference to shoeing smiths.

12913. That is a most important subject?—It is the only one I have any knowledge of.

12914. Perhaps you will give us your views on that particular point?—I think I may say shortly my idea is that a handicraft can only be taught by manipulation, by showing the man what he ought to do and correcting his errors if he has any to correct.

12915. Efforts are being made, are not they, to do that in various counties?—Certainly.

12916. Are you engaged yourself in work of that description?—No, but I did have a fair experience in it.

12917. In which county?—In Berkshire.

12918. (*By Mr. Latham.*) May I ask you kindly to give us some of the knowledge that I know you to possess as to the time we began?—It was started with a shoeing van

and an instructor. The van went from centre to centre, and the length of stay it made at each centre depended upon the number of pupils.

12919. (*By Lord Barnard.*) Did it attract the men?—Certainly.

12920. And, naturally, if they found that they got advantage from it others would come to it?—That is so, and they did do so.

12921. Speaking from your own experience, has horse shoeing improved since the introduction of that system?—Certainly.

12922. Do you think the van should be kept going?—I do, for the simple reason that there is no apprenticeship now, or very little.

12923. That was supported by the County Council, I believe?—Yes.

12924. (*By Mr. Latham.*) When the shoeing classes were first started in Berkshire, that was the first of the kind in England?—I believe it was.

12925. You have possibly before, and certainly since that, been continually judging, so to speak, at county shows?—Yes.

12926. And from your experience, do you tell the Committee that the improvement in the shoeing of horses generally has been very marked?—Certainly.

Mr. A.
Wheatley.
—

Mr. A.
Wheatley.
—
2 July, 1907.
—

12927. Now with regard to the registration of all these smiths—has this teaching led to a better class of men taking it up?—Yes, I think so.

12928. I suppose I may say very shortly you would wish to see this thing continued?—Yes, I should wish to see it continued certainly.

12929. The different members of the profession are, I suppose, quite as well aware as you are of the yeoman service this undertaking has been to the cause of horse shoeing?—I think so.

12930. Now, with regard to young smiths, has there ever been any difficulty in getting the young smiths to come to the forge?—No, I do not think so. I have never experienced any difficulty.

12931. Then if there was any difficulty the difficulty was with the older men?—Certainly.

12932. But that has been got over?—I think so.

12933. Now I will go on and ask you whether you think there is any public money that could be better spent by the County Councils than has been spent on this undertaking?—I do not know what they spent, but I know it was very well spent in Berkshire. I am sure of that.

12934. But your experience as a judge must show that Berkshire has not been alone?—Generally it has been so.

12935. It is quite rare now to find the bad shoeing of 20 years ago, is it not?—Certainly.

12936. Not only have these young men been taught how to shoe better, but they know a great deal more of the anatomy of the horse's foot than they ever could have done if this had not taken place?—That is so.

12937. (*By Mr. Medd.*) By whom are you employed?—By the Berkshire County Council.

12938. Do the Berkshire County Council pay you a fee?—No.

12939. Have you met with any objection on the part of veterinary surgeons to the instruction given under the County Council's auspices?—No, not any in reference to farriery.

12940. No professional objection?—No, not in reference to farriery—by that, I mean shoeing.

12941. I may take it that the veterinary surgeons of Berkshire and other places have been very pleased that such instruction has been available?—Yes, they have.

12942. What class of people attended as a rule? Were they farm lads engaged on farms?—They were shoeing smiths, really.

12943. I quite understand that a veterinary surgeon might object to instruction given under any of his branches?—Certainly.

12944. You have found that by qualifying your students in Berkshire in farriery you have strengthened your claim upon the Board of Agriculture?—Certainly.

12945. You have been doing, in other words, what I may term necessary farm work?—Certainly, very necessary.

12946. And the more it is done the more the animal improves, not only in health but in work?—Certainly.

12947. (*By Mr. Latham.*) Prior to the time when we took up this teaching there had been very little teaching in farriery work at all?—I think that is so. I do not know of any.

12948. It is almost a wonder how the successive smiths carried on their occupation?—Certainly.

12949. In answer to a question Mr. Medd put to you you said, in effect, not only did it benefit agriculturists generally, but the world at large—that is the teaching that has been given to the shoeing smiths?—Yes.

12950. And that applies to all commercial trades and the army, and in every instance in which horses are used?—Certainly.

TWENTY-FIFTH DAY.

Wednesday, 3rd July, 1907.

PRESENT :

{ The Lord BARNARD (*in the Chair*).

The Lord BELPER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. H. TRUSTRAM EVE, called and examined.

Mr. H. T.
Eve.
—
3 July, 1907.
—

12951. (*By Lord Barnard.*) You are at present Secretary of the Farmers' Club?—Yes.

12952. How long have you held that appointment?—Since June, 1905.

12953. Prior to that you were Secretary to the Bedfordshire Chamber of Agriculture?—Yes. I helped to start that.

12954. By profession you are a land agent and rating surveyor?—Yes.

12955. You have been acquainted with farmers and farming all your life?—Yes.

12956. Have you farmed yourself?—Yes.

12957. Are you farming now?—No.

12958. Have you farmed in Bedfordshire?—Yes.

12959. Do you come of a farming family?—Yes, my grandfather was nothing but a farmer; my father was a farmer, and then developed into a surveyor.

12960. The Farmers' Club was started by some members of the Royal Agricultural Society and of the Smithfield Club in 1842?—Yes.

12961. Since you have been the Secretary of that Club, the membership has increased very considerably, I think?—That was just before I was Secretary. That was when Mr. Druce was Secretary.

12962. You have members in nearly every county in England?—Yes. We have members in nearly every county in this country and also in Ireland and Scotland.

12963. The object of the Club is to discuss matters of importance affecting agriculture?—Yes.

12964. Are your meetings well attended?—Yes; we get a very good attendance; it is a strictly non-political club.

12965. Papers are read and discussions follow?—Yes.

12966. Those papers and discussions are afterwards printed and circulated?—Yes, to each member and to the press.

12967. One of the rules, you tell us in your *précis*, is that at least three-fourths of the members must be connected with agriculture?—Yes, that is a very important point.

12968. Of course, people connected with agriculture include a great many others besides actual farmers: land-owners, for instance, such as I am myself, and valuers and estate agents and so on?—Yes.

12969. You are an examiner for the National Diploma?—I am.

12970. You act as agent, amongst other properties, for a large number of small properties, I see?—Yes.

12971. You are in daily contact with farmers as a tenant right valuer?—As a rating surveyor I have come across farmers to a large extent, particularly by making a field to field valuation of over 500,000 acres of agricultural land.

12972. You have had many opportunities of ascertaining the needs of farmers with regard to the subject of agricultural education?—Yes. In a small way I have worked for the interest of agriculture all my life.

12973. Will you tell us how the Farmers' Club came to consider this question as they did recently?—In October, 1906, when the sessional programme for 1907 was being considered, the committee thought that one of the most pressing subjects was the agricultural education of farmers' sons and we selected that as one of the subjects to be discussed. We asked Mr. A. D. Hall, of Rothamsted, to prepare and read us a paper on the subject, which he did on April 29th. Curiously enough, the appointment of the Departmental Committee was announced a few days before that date, so it happened to fit in very well.

12974. That paper was very fully discussed, I think?—Yes.

12975. You have told us that you are well acquainted with the views of the farmers on this as well as on other subjects. What is their opinion on the subject of agricultural education now?—I am afraid they have never been satisfied with it. Whether they ever will be I do not know, but at present I am afraid there is a feeling of dissatisfaction and that this Committee is wanted, and that farmers are looking forward to your report with great interest, and hope that some improvement will be made.

12976. Can you indicate at all the lines of that dissatisfaction—the grounds on which they are dissatisfied?—That is a very difficult question, but I think it is mainly wrapped up in various parts of England in this, that they want the right man to instruct them. I think really that is the most important point in my evidence.

12977. Do you think that possibly they are under some slight misapprehension on that point?—I think many are.

12978. It would be a very great thing, in fact, to continue informing the farmer on what is being done; he really does not know sufficient at present to appreciate it?—I do not think I could agree with that.

12979. We asked a witness the other day, who expressed very much the same opinion as you do when you say farmers consider that the right men are not found. I asked that witness if he could tell me, without giving names, of course, of an instance of a wrong man being appointed and he said frankly, when he came to think of it, he could not. I should like to ask you that same question: do you know instances of men not being suitable?—Yes. In confidence I could give instances of two or three who are absolutely unsuitable, and who have done more harm than good. On the other hand I should like to say that there are many men, and men that I know, who are doing absolutely good work. It is simply a question: Have they or have they not the confidence of the farmers in the county; if they have not, they are doing more harm than good. What happens is this: a young fellow goes straight from a college into a county as an agricultural instructor, and in the course of conversation, or in the course of a lecture, he makes a slip of a practical nature and his influence is gone for the next two years. That young fellow must have time to get the practice into his head and when he has once got it, there

is no body of men who will listen more eagerly or who are more desirous of profiting by teaching than farmers; they are very anxious to learn.

12980. Are you acquainted with the previous history of these county lecturers?—Yes. I think I know where they emanate from, and so on.

12981. Do you know as a fact, that nearly all of them are the sons of practical farmers and have worked on farms themselves? One gentleman that we had here told us that he had worked upon a farm until he was 24 years of age?—I should think that that was not the fact—I do not mean in that individual case; I mean as a general thing.

12982. Quite so. I do not wish to confine you to individual cases; I only instanced that one case. I know farmers do say that these lecturers are not practical men, but we have examined a great many of them and nearly every one of them that we have had before us has been brought up on a farm. Before we leave the subject of teachers, do you think that these men are unsuitable in some cases because they are not perhaps well qualified to instruct others or to convey the information which they themselves possess to others?—Yes, I think that is a fault not only in agricultural instructors but also in public schoolmasters, that they have not been taught to teach. Where you get an elementary schoolmaster he very often teaches much better than a public schoolmaster for the simple reason that he has been taught to teach.

12983. Would that point to the great desirability of selecting lecturers more on the ground of their capacity to make friends of the farmers, and being able to convey the information they possess to the farmers rather than on the ground of their individual attainments?—I am afraid that is so. If I were headmaster of a public school, I would rather have a man who could teach and keep order than a senior wrangler who could not.

12984. On the subject of agricultural colleges, you would like to give us your opinion?—I am very much in favour of them. I think they are being run by a wonderfully practical set of good men, but taking into consideration the whole question of agricultural education, and speaking of the farmer, I do not think that, directly, they deal with more than 5 per cent. of the farmers in England.

12985. You began by informing us that there are a great many men, yourself included, connected with agriculture, who are not farmers?—I think that some of these colleges give an excellent training for young land agents, and they directly come in contact with farmers, but not as teachers.

12986. They ought to have a good training. I think perhaps I ought to point out to you that we do not limit our enquiry to farmers' sons. We are here to enquire into the facilities which exist for providing technical and scientific instruction in agriculture. Some farmers' sons would not want that at all because they are not going to farm perhaps, and on the other hand, other men who are intending to take up other duties in connection with agriculture are not farmers at all, so that we must not limit it to farmers' sons, although, no doubt, the bulk of present-day farmers are farmers' sons?—I do not think the State need worry about those people who have sufficient means to see that their sons are properly trained to fit them for the post of land agents, and so on; they will learn farming somehow or somewhere, and I do not think it wants a Departmental Committee to see after them. The man I am worrying about is the ordinary farmer; something wants doing for him.

12987. Yes, but these colleges do not exist exclusively for the benefit of the farmer's son. You have mentioned land agents, but I could name many other professions; foresters, for instance, one of the most important items at the present day in the history of land, and agricultural chemists, and you might say manure merchants and seed merchants, who all obtain information and instruction at colleges which will be very useful to them in their businesses?—I agree, but another way is to article a boy to a manure merchant or a chemist, or a forester on a big estate, and you would get the same result.

12988. Would you agree with me from a national point of view that it is desirable to level up the general knowledge on all these subjects and that that can be best done by means of these agricultural colleges?—Yes. I am of opinion that agricultural colleges are an absolute necessity.

12989. For instance, with regard to research work, that is a question which is really outside the scope of this Committee, but we have not been able entirely to exclude it?—Yes, research work is absolutely important.

12990. You value research work, I am sure?—Absolutely. Farmers do not to a large extent admit the value

Mr. H. T.
Etc.

3 July, 1907.

Mr. H. T.
Eve.

3 July, 1907.

of it, but agriculture to-day would be absolutely impossible unless we had people carrying out research.

12991. (*By Mr. Latham.*) Is not that because it has not been brought before the notice of the farmers?—Exactly. That is why I want these good agricultural instructors to take things that have been scientifically proved, and practically proved in a small way, to the farmers and say: "Now I have got something here that is going to do you good."

12992. (*By Lord Barnard.*) That comes within the scope of our Committee, although, naturally, it does not apply to you so much. I may tell you we have had information from two Universities who are taking up this subject of research and who do not propose to teach anybody; they propose to do laboratory work and research work only, you admit the importance of that?—To a tremendous degree, but I think with regard to all this research and experimental work when it is done it seems to me that it does not get aggregated in a form that the farmer can use at present.

12993. The great need is really to distribute and diffuse information which is being obtained by these colleges in a way that will inspire confidence amongst the farmers. That should be done largely, you think, by a judicious selection of lecturers?—I want to get one good man of a certain age with, say, a county as a unit, who would have almost nothing else to think of. At the present time the head agricultural instructor, whatever you call him, in a county has got such a lot to do in looking after different things and getting-up and preparing his lectures and one thing and another, that his mind is not on the individual instruction of the farmer.

12994. That would involve an increase of staff, would it not?—I am afraid so.

12995. And consequently increased expenditure?—I am afraid so.

12996. You have been a member of the Agricultural Sub-Committee of the Bedfordshire County Council?—Yes. I served on the Agricultural Sub-Committee for some years.

12997. You know the extreme difficulties which are experienced in all counties in increasing the funds which are allocated to agricultural education, and that in fact in some counties there is a tendency to decrease the expenditure in consequence of the heavy demands upon the County Councils for other education?—I think the way some County Councils have treated agricultural education is absolutely disgraceful. There is no other word for it, and upon this financial question I am sorry to say that every day it is getting worse. Since secondary education got on the rates, I can quite see that agricultural education is being put more and more on one side and the farmer is a bigger sinner than anyone on this question in the County Council. He has such a horror of higher rates—with which I sympathise—that he will cut down anything to save the rates, and the first thing that goes, in my experience unfortunately, now is agricultural education, and that is a most serious thing. For the next few years as secondary education goes up agricultural education expenditure will go down, and it wants a strong hand from up above to stop it.

12998. You have laid down two propositions with both of which I quite agree. One is the absolute necessity of increasing this work, and the other the certainty of the impossibility of doing it under present circumstances. What is your remedy for that?—I think there must be a little more control of the County Councils than there has been in the past and I think it might be done in a mutual way. If a county showed any disposition to spend money on agricultural education—and I admit they must have a voice in it because they know the needs of the county—I think they might be backed up with, say, a similar amount from the Imperial funds, but I do not believe in Imperial funds and local control. I think if a county said: "We are disposed to spend £2,000 a year on agricultural education," that they would be more likely to spend it if they found they were going to get £2,000 a year from the State.

12999. Perhaps you will agree with me then, that under those circumstances, the State should have a certain amount of control and direction over what the county is doing if they are going to contribute a considerable sum of money to it?—Certainly, and in my experience the initiative we have had from the inspectors of the Board of Agriculture, has been most valuable in the past and it is most necessary that it should be continued.

13000. You are aware that the staff is more or less exiguous?—As far as my knowledge of them in the past

is concerned it has only been of Mr. Brooke-Hunt. In the counties we live in somewhat a narrow way, and we have only the knowledge that we gather in that particular county, and one man engaged by the State in going round from county to county must know more than we do, and though we might have a voice in 50 per cent. of what we want to do, surely his ideas with regard to the other 50 per cent. must be extremely valuable.

13001. There has been a suggestion made, I do not know whether you have heard of it, that this work should be under the control and direction of the Board of Agriculture, and there should be some kind of Consultative Committee or Council seated in London to advise the President of the Board of Agriculture on such subjects, consisting of members drawn from all parts of the country. Do you think such a scheme would be practicable?—Very pretty, and very ornamental, and very complimentary to the country: but really I think the Board of Agriculture knows quite enough of the agricultural needs of the country without consulting a committee such as you describe; and I for one am quite prepared to trust them.

13002. Might not it be an advantage to the central officials to get advice and opinions from all parts of the country?—Perhaps I am wrong, but I am not a great believer in these committees. I am much more a believer in a man going about and getting information where he wants it, on the quiet.

13003. (*By Mr. Latham.*) If the central committee were in unison with all these local bodies, would you not be much more likely to get the money that you require?—If there was any moral effect in the Committee it would not do any harm, but the direct question to me was, would it be of any use to the officials of the Board of Agriculture?

13004. We want it the other way up?—From the financial and moral point of view it might do good; but my point was that I did not think the Board of Agriculture officials required any information from a general committee.

13005. (*By Lord Barnard.*) You think the Board of Agriculture is the best public Department to deal with this subject?—Yes, no doubt; it could not be better. The Board of Agriculture has gained the confidence of the farmers in the last few years, as I tell them, by being the Board for Agriculture instead of the Board of Agriculture, and they have gained the farmers' confidence in another way also, that is, by the issue of these leaflets. I have never heard any individual farmer who has been able to pull these leaflets to bits. They are correct, and farmers are very fond of them. The Board of Agriculture has gained the confidence of the farmers by showing them that they are a practical body.

13006. In your experience do those leaflets reach the hands of all who might have them and who might profit by them?—The answer to that is, it is their fault if they do not, but they do reach the homes of the farmers that are not in touch in any other way: I frequently see them lying on the tables of farmers, but I am sorry to say that more farmers ought to send postcards and ask for them.

13007. Do you know of any instances of farmers consulting county lecturers, and people of that sort, and asking for advice?—Yes.

13008. That is a valuable work also?—Very. We want to have a man in every county that we can consult.

13009. Perhaps you would go as far as to say that any work done, say by the university colleges, should be public property and belong to the Board of Agriculture and be distributed over the whole country—all the knowledge that is obtained?—Yes, but in my experience they are generally published.

13010. Quite so, but do they spread? For instance, in Bedfordshire, do you get the results of experiments which have been made in the North of England say, or in Wales?—We get them all somehow by post, but what is wanted is somebody to take hold of the whole thing and in an intelligent and short way put it into farmer's language and pick out the good from the bad. It does not want just a summary of it: it wants someone with a good name to write a short report on it for the farmer, and he will read that.

13011. I think at the present day it has become a great deal more the practice—at least I know it has in my part of the country—for well-instructed farmers to write short paragraphs or articles in their local newspapers: that is so, is it not?—Yes: I look upon the local newspaper as the best medium of reaching the farmer compared with any other way—they all read that.

Mr. H. T.
Eve.

3 July, 1907

13012. So that the more information you can get and the more you can diffuse it the more the farmer will appreciate it?—Yes, but I am rather frightened of diffusing all the energies of these various people in experiments and demonstrations, because some of it may do harm for the reason that we do not know on what sort of land the experiments were carried out.

13013. I should imagine any description would describe the nature of the soils exactly?—That is exactly what I say. I want it done by some good practical person before it goes to the farmer, otherwise it might do harm.

13014. (*By Mr. Latham.*) Will you tell me this, would not you welcome the idea of the Board of Agriculture receiving all this information and tabulating it and making a report on it?—Certainly.

13015. (*By Lord Barnard.*) Would you inform us what your views are as to the proper methods for educating budding agriculturists?—I think it is pretty much wrapped up in the general views I have given. It all depends on the individuality of this one man, and he must have a free hand.

13016. I thought perhaps you were going to say something about schools as distinct from colleges?—I am a great believer in agricultural institutes and colleges. My experience goes to show that short courses are the only things that will touch the bulk of farmers. There are certain farmers who send their sons to agricultural colleges and I am glad they do. Probably you have had statistics from the colleges as to what becomes of those men afterwards, whether they ever go back on to the land as ordinary farmers, but I very much doubt it.

13017. Some of them do?—Yes, some, but not a large proportion. I am a great believer in short courses for farmers—from five to ten weeks?—A boy goes to the first course, and if he is fitted for it and likes it he will go to another course, and then to another and he may drift on to something good eventually, but these short courses start them off in the line they ought to be.

13018. In a large number of cases farmers' sons, particularly small farmers' sons, go to an elementary school?—Yes.

13019. When they leave the elementary school, of course circumstances would differ in different cases, would you as a rule send them to a secondary school?—Yes.

13020. I am rather following out the lines which have been given us by a good many witnesses. Then the next absolute essential is that they should have at least two years' practical work on a farm?—Yes.

13021. And then go in for those short courses?—That is right—keep on educating himself by every means he can at night schools or anything, but he must do his practical work on the farm with his father.

13022. I do not know whether you know the Farm School at Basing or the Newton-Rigg Farm School in Cumberland?—No, I am afraid I do not, but I think very likely we have the same sort of thing at Ridgmont in Bedfordshire.

13022a. What is your opinion of the Ridgmont School?—Absolutely excellent now. You have heard a good deal of how it was started, no doubt, and all on wrong lines. It was for labourers' sons first of all, which is not wanted. I was honorary secretary of a committee of nine agriculturists, with Mr. Whitbread as chairman, that sat to consider what we could best do with the Agricultural Institute when it was admitted to be a failure for labourers' sons. We sat as a small committee, and heard witnesses and drew up a report as to what we thought ought to be done. After long consideration we came to the conclusion that it should be a place for short courses under a proper instructor. Before that time it was the fashion of a good many people in the county to sneer at Ridgmont, but their sneers have absolutely, or should have, died away through facts, and I consider Ridgmont an excellent place now in every way.

13023. It is not a very expensive school to the county, is it?—No.

13024. You think it would be a good thing if schools of that type were multiplied?—I think that is what we want.

13025. What is the present attitude of the farmers of the district towards Ridgmont?—They will not admit it, but a good many of them know that it is doing very good work. At the back of their minds they do not like it because it is costing something to the rates.

13026. You have given us a rather long list of subjects here?—Might I pick out two; Farriery and demonstration plots. I do not know much about the others. Farriery we have done a lot in in Bedfordshire, and I think it is

absolutely necessary that continuous instruction should go on year after year. I mean so many counties do it for two years or so, and then drop it. Young blacksmiths are always growing up like other people, and it wants continuous instruction and exhibitions and competitions, and I am a great believer in peripatetic instruction in farriery.

13027. In your experience has the result of farriery teaching been good?—It has absolutely improved the shoeing of the county. Everyone will admit in Bedfordshire, the people who keep hunters and everyone, that the type of shoeing has improved through the instruction given in farriery; there has been less pricking, and more understanding of the horse's hoof.

13028. Would you like to say a word on demonstration plots?—Yes. I have a great horror of the word "experiments," unless they are conducted by agricultural colleges or at such places as Rothamsted, or by someone who understands them. I am very fond of demonstrations, particularly roadside demonstrations, with a board up and the place at right angles to the public road, so that farmers can stop at any time when they are driving along in their dog-carts and see what is going on, or they can see the difference in colour. That, I think, is excellent.

13029. Have you anything more to say on these subjects?—No.

13030. Now would you like to say something on the subject of examinations?—Yes.

13031. What are your views on that?—I was one of the examiners for the Royal Agricultural Society before the Royal and the Highland amalgamated and formed the N.D.A. examination, and I have practically been examining on the subject of surveying and other subjects all my life, and up to that I was being examined myself. The examination at Leeds is on different lines from any other examination in England, because the examiners meet there, look over their papers in a room together, and discuss doubtful candidates at once, even before we do so officially with the Board when it meets to hear the results. A further safeguard is that the candidate is examined *in viva voce* a few hours after the examiner has seen that man's paper. In my experience there is no other examination in England that does that, and I think that is the best possible way of avoiding "cram" and for passing the right man. With regard to the different subjects, I have a general knowledge of a good many of them. I have read each paper on each subject each year, and I have an intimate acquaintance with the examiner in each subject, and how he looks over his papers, and we talk frankly and freely together for three days, and I do not know an examination where the papers are of a more practical nature. I do not see anything the matter with them. I know that many teachers of the candidates object that some of the papers do not contain the questions on the points which the teachers want to teach the candidates, but I think that opinion is dying out, and I was very much struck the other day when talking with one of the heads of the colleges about this point; he complained that the examination was not practical enough, which pleased me immensely, because I always thought that the agricultural colleges were of opinion that the examination was a little too practical and not enough professorial.

13031a

13032. At whose cost is the examination for the National Diploma carried out—by the two societies paying the expenses, is it?—Yes.

13033. Is there any fee to the examinee?—An honorarium to the examiner.

13034. Does the student who comes up for examination pay a fee?—He pays a small entrance fee.

13035. I will ask you this one general question upon it. Is it your opinion that this National Diploma examination should be continued?—Most decidedly.

13036. Are there any other points that occur to you?—I think page 7 of the *précis* is rather interesting as showing the six points which a Joint Committee of the Farmers' Club and the Central Chamber of Agriculture asked for in 1890, because anyone reading those recommendations will see how we have got on since then.

13037. Would you like to read them?—I think I should, because I do not think anything shows you better how agricultural education has got on during the last 17 years than can be shown by reading what farmers wanted 17 years ago. They are as follows:—

"(1) That there should be established and maintained at the cost of the State a Central Normal School of Agriculture.

"(2) That State aid should be liberally given to certain endowed and county schools, on condition of their

Mr. H. T.
Eve.

3 July, 1907.

establishing an agricultural side for the proper teaching of the theory and practice of agriculture, practical instruction being carried out on a farm which either be the property of a school, or rented by the school, or available by permission of neighbouring farmers. Arrangements should be made for the delivery of courses of lectures by the teaching staff for other lecturers open to farmers of the district.

"(3) That grants should continue to be given by the State in aid of local effort to provide technical instruction in dairy or other branches of farm work.

"(4) That aid should be similarly given to local agricultural associations or chambers of agriculture engaged in scientific research.

"(5) That in all cases where State aid is afforded it should be of a permanent character, subject only to certain definite conditions laid down by the Board of Agriculture, and to the admission of annual inspection by an officer of the Board.

"(6) That ample facilities should be afforded by the State to enable children in rural elementary schools to acquire knowledge of their future work, either as agricultural labourers or as tenants of small holdings."

13038. The first refers to a Central Normal School of Agriculture. That was proposed by Sir Richard Paget's Committee some years ago?—Major Craigie could tell you that; I do not know.

13039. The point I wanted to come to, and I do not know whether Major Craigie can tell us, is why it was not carried out. We have had a good deal of conflicting evidence on the question of agricultural sides to schools. Many of the witnesses think they would be of great value, others doubt it, and say that even if they were of value, they would be too costly. What is your opinion on the subject?—I doubt their value.

13040. No. 4 is that aid should be similarly given to local agricultural associations or chambers of agriculture engaged in scientific research. I think I should like a word of explanation as to how you would propose to carry that out?—That is what this Joint Committee wanted 17 years ago.

13041. Practically that has been carried out in another way—at least to a large extent?—Yes, and I should think in a better way, too. I cannot say that I quite agree with that; I think we have got beyond that now.

13042. (By Professor Middleton.) Your object is to show how much we have progressed in 17 years?—Yes. I think it is remarkable; some of those suggestions seem quite puerile now.

13043. (By Lord Barnard.) How far is it your opinion and the opinion of the Farmers' Club that sufficient progress has been made in elementary schools to enable children to acquire knowledge of their future work as agriculturists?—I was told that was a matter we were not to deal with. I cannot speak as secretary of the Farmers' Club as to that. I made a few inquiries as to what was going on, and that was one of the things I was told—"do not touch on elementary education."

13044. Are there any points I have omitted to ask you about upon which you would like to express an opinion?—No, I do not think so.

13045. (By Lord Moreton.) I am very glad to hear you have such a good opinion of the National Diploma examination, and I should just like to put one or two questions to you with regard to that. Do you think it would be an improvement if instead of holding that examination at one centre it were held at various centres?—I do not think so; I think it would be an unnecessary expense, because if a young fellow is really going in for an examination he does not mind whether he pays another 5s. for his railway fare or not. Do you mean the sentimental question whether a Scotchman likes to come to England to be examined, because that is one of Professor Wallace's opinions, I believe?

13046. No, what I am referring to rather is this: would it be fairer to a pupil living, say, in Wales that he should be examined somewhere in Wales rather than in Leeds; in other words, in the district with the agriculture of which he is best acquainted?—I think while we only get 48 pupils in Part I that it is not big enough to split up yet.

13047. You do not think if it was split up that there would be more pupils?—I think perhaps the agricultural college people ought to answer that question; personally, I should say no, but the heads of the colleges would know whether they have any refusals through distance.

13048. Do you think it would be an improvement if the

examination could be held more out of doors, I mean by that if it could be held at some college, for instance, where there was a farm, and that the examiner should take a walk with the pupil and do the practical agricultural examination, the *viva voce* part, out of doors on the farm?—I think that is the only improvement that could be made, and it would be a splendid improvement, and I thought I had put that in my *précis*. I do think that is the finishing touch it wants to the agriculture paper, because it is possible, I am afraid, even with the best examinations, to so coach a boy that he can get through it, and yet fail on the very very practical questions that one could only put by going round a farm; but I am afraid that the expense would be rather large, and that the time occupied would be heavy.

13049. I suppose you would agree with me that if such a system could be arranged there are other subjects besides agriculture on which questions might be asked out of doors—farm botany, farm entomology and possibly others?—Yes, I think if you had, we will say, 20 candidates on a farm, you could certainly employ five examiners in five subjects, and they all could be doing some at the same time, and it would be absolutely splendid.

13050. (By Mr. Latham.) With regard to what you have said as to having the right man and on the right lines for teaching the agriculturist, I would be very pleased if you will be a little more definite on that?—I want a man who has been through an agricultural college, but I quite see the difficulty of knowing what to do with him when he has left the college and before he is old enough to teach the farmer—no doubt you have got that from other witnesses, but, personally, I do not quite see what is to be done with him. From the county point of view I do not want him, and he must not go to the county straight from college and begin to teach farmers until he has learnt somewhere what the British farmer is. I do not know where he is to learn it, but he must not assume the position of an agricultural instructor until he has learnt it; he must go as an assistant somewhere first.

13051. I am willing to admit, and I hope my colleagues will agree, that this right man has never been defined in this room yet, and I am very anxious to get you to define it?—I can find him for you, but there are not many of them about.

13052. Will you tell us what class of man you would like him to be—what sort of man. Should he be a man that has actually been a farmer himself and who has tried to make his living by farming?—Personally, I do not think that is important, and although I may fail practically myself every now and then, I have somehow managed to pick up enough practical knowledge so that I can do my work, and yet, personally, I have never lived and worked on a farm. I have found great difficulties all through my life through not being practical enough, but I have picked it up through age, and I think these other men can do the same thing.

13053. Then are we to take it that he should be a man of rather mature age before he starts teaching agriculturists?—I do not mean mature age, but I do not want him to be quite a young man just come from college. I do not think it is necessary he should have emptied a dung cart under his father's eye, or mended a drill, or actually handled a plough. I know those were the three necessities at one time before a man could consider himself a farmer, but I think we are beyond that now.

13054. Would you suggest they should be sons of farmers?—No.

13055. That is the class of man you would like to be the general lecturer throughout the country?—Yes, I want him to think of nothing else but what good he can do to the agriculture of his county.

13056. I think from your answers to Lord Barnard we may pretty freely come to the conclusion that for the best class of farmers there is very little necessity for us to take care of the education of their children?—I should not worry about that. They are quite capable of taking care of themselves. They attend every lecture and pick up every bit of information they can get anywhere and use it on their farms. It is a class still lower than that that I want to get at—the man living down the unmetalled lane. That is the man I want to get hold of. He is in the same state now as he was 100 years ago. He reads nothing and muddles along anyhow. What I want is an instructor who can go on his bicycle and call on a man like that, because that man will never find the instructor, the instructor must go and find him.

13057. I was just going to use the words that I think belong to Bedfordshire more than any other county, that if they will not go to education, education must be taken

to them?—That is it. That was the finding of this small committee in Bedfordshire of which I was Secretary.

13058. Are you of opinion that many men have expressed in this room that agricultural sides to secondary schools would be a mistake?—I am perfectly certain they would. It was proposed to do that in Bedfordshire for the sake of running after a charity of £200 a year. They thought they could get hold of that if they were to go to Dunstable, but Dunstable being on the chalk I opposed it, because I said you could not have phosphatic experiments on the chalk. They wanted to tack an agricultural side on to the grammar school. I opposed that and said I thought it would be a great mistake.

13059. After they have left the secondary schools, you think they should take a course of short courses that would lead them up to the college or the scientific instruction?—No, I do not think I go as far as that. I think the short courses should stand by themselves.

13060. I wanted to get from you whether the short courses lasting for ten weeks or so would not give these young men an idea that they knew enough?—With their farm and a succession of short courses, I think that is enough for a farmer.

13061. Without any science?—He gets his science in the short courses.

13062. He would not get very much science in five or six weeks?—I do not say five or six weeks. I say a series of five or six weeks. You must remember that they are arranged at a time when the farmer can spare the boy and he can go on for years if he likes attending the short courses.

13063. I cannot see where all the money is to come from that will have to be allocated to these short courses, and it must be by means of help from the counties. My experience is that if they are not charged a fee at all they will not go to them?—Our courses are filled at the present time.

13064. With the young farmers and the better class of agricultural labourers?—Not agricultural labourers but farmers.

13065. I have often been discussing the question of how beneficial it would be if we could get better farm bailiffs. Nine-tenths of the farm bailiffs are not farmers' sons, they are agricultural labourers?—Farm bailiffs are not agricultural labourers?

13066. What I am very anxious to know is this. I think there are a very great many very excellent farm labourers that have risen above their class and would be much better servants to us if they could have a rather better agricultural knowledge?—May I interrupt you for one moment. We are at one. When you said the word "bailiff" I did not know you meant what we call in our part of the world, working foreman. Our working foreman comes from the agricultural labourers, but our bailiff, that is a man who would manage a home farm, I should say would probably have been a farmer's son. In my experience, the farm bailiff is a superior man to the working foreman. I do not agree with one thing—from my experience of working foremen, and I have had them under me all my life—if you begin to teach them much science you begin to take them out of their own line; they are a splendid set of practical men with great knowledge, and I am not sure that you would not spoil them.

13067. I am very much afraid the words you used just now that the farmers were the greatest sinners must apply there also?—If you had a working foreman managing an outlying farm of 500 acres, you ought to put the science into the farming and you ought to have an eminently practical working foreman there, and I do not think it is necessary that that man should know a tenth part of what you know.

13068. I agree?—He would be a horrid nuisance if he did, I think.

13069. But is it not better that he should be a better educated man than he is under the present system of education?—If you want to improve his position and somebody is going to lend him the money to take a farm for himself I agree with you, but if he is going to be a working foreman all his life I do not.

13070. Why does not this man want as much education as the small working farmer—the farmer who is going to farm 40 or 50 acres of land?—Because the working farmer has to have the knowledge of Mr. Latham in his head while the working foreman gets his knowledge from Mr. Latham. There are two separate working brains in the one case and a combined brain in the other.

13071. Do you not think the working foreman may be a most useful man if he has some slight veterinary knowledge, for instance?—Yes, I think it is very important he should have that, in fact, my experience between a good working foreman and a bad working foreman is that he varies in direct proportion to the veterinary surgeon's bill. If you get a fool you will have big bills from every one all round, the tradesman, the veterinary surgeons and so on, because he is always sending for some one, as he knows nothing himself, but if you get a good man who has been brought up properly and knows the smaller diseases, you will find you will have no veterinary bill at all probably.

13072. How is that man to get his education unless he attends some of these short courses?—I think if he started on the farm when he is about 12 years old, by the time when he is about 40 or 50 he has got it—I cannot tell you how, but he has got it.

13073. (By Lord Moreton.) If he started on the farm as a child and had a chance of going to short courses, would he not be a valuable man at 30 instead of, perhaps, having to wait until he is 40 or 50?—Yes, but I am so afraid that if you teach that sort of man you will spoil him. It is because he is so eminently practical that you would spoil him. He cannot write and has never ruined his memory by writing anything down as we all ruin our memories by keeping a pocket-book. He never forgets anything, and he is an eminently practical man. I will give you an example if I may—take wild onion; scientific people have been trying to find out how to cure wild onion, and up to the present they have not succeeded very much, although one or two of them now think they have found it out, and I think they have. I do not think it is necessary for the working foreman to know how to eradicate wild onion, but it is absolutely necessary for the small farmer to know it. That brings out the distinction between the two.

13074. (By Mr. Latham.) I am disappointed, I must confess, that you do not see the necessity for raising the purely working foreman to as good a position as the man who farms 50 acres of land, and who has not had anything like half the responsibilities that the working foreman has?—I do not think you want to do too much to the working foreman, else you will do away with the *raison d'être* of his existence. He is there to be told on big points what to do, and he is there to do small points on his own initiative; I think he is quite different from the small farmer.

13075. I must say I think he is a much more responsible man. Do you favour that these young men should be articulated to better class farmers?—Yes, if you can get the right farmer. Personally I always send them to Scotland. I may be wrong, but I have a greater opinion of the firm hand of the Scotch farmer than of the jolly life which is generally found on the English farm, and which, I am sorry to say, has frequently been the business ruin of many a young fellow.

13076. With regard to the young people, after they leave the practical man are they fit to go to college?—Yes, but not if they are going to be farmers.

13077. You really do not value the life of the college to a farmer who is going to make his living out of farming?—Supposing a man has only £3,000 in the world, and he is farming 200 or 300 acres and has got a boy, if that farmer is keen on that boy following him in the farm, I should certainly advise him not to upset his boy's mind by sending him away from him so long to an agricultural college, because he will never come back and get his living with that £3,000 out of farming in the same way as his father did.

13078. How is that young man to get his scientific education?—By these short courses. I say that is sufficient for him, but you must not overdo it, and he must do the rest himself.

13079. And possibly to get a little information from Professor Voelcker, and others of his class, because you would never get sufficient education in five or six weeks to get analyses of soils and values of manures, and so on?—No; but what with educating himself and going to a sufficient number of these courses, I think he will get sufficient knowledge for a farmer, but if you do too much he never will be a farmer at all.

13080. I think from your evidence we must come to the conclusion that scientific education is against farming?—No, you must have these colleges to produce the men that are necessary to teach the farmers. Let me put it in another way. If I had a son, and I wanted him to come into my office, and I sent him for four years to Oxford, I am

Mr. H. T.

Eve.

--

Mr. H. T.
Eve.

3 July, 1907.

perfectly certain he would never sit down in my office ; it is the same thing with a farmer. If you send him away for two or three years to an agricultural college—I may be wrong—but I think he would not settle down in what I call a second-class farmhouse with not much money about and earn his own living with the same capital that his father had ; it would upset him.

13081. With regard to the rates for the teaching of secondary education, you made the remark that you thought the farmers were the greatest sinners. Do you not think that is the most natural thing under existing circumstances ?—I think it is most important that someone should watch that the rates should not go up, and I think it is to the credit of English farmers that they are more or less really the only people who are serious in that, but when it comes to the point of farmers objecting to rates being raised, and thereby cutting down agricultural education, I am against them.

13082. I quite agree about being against them ; but is it not the most natural thing that they should be against paying these heavy rates when the good that could come from it is not at all allocated to farming, but generally to other purposes ? Since 1902 all the money allocated to secondary education has been absolutely against the farmer ?—I agree ; but where it comes to an increase of a halfpenny rate, and to avoid a halfpenny rate they cut down agricultural education—because that is what it comes to in the end—I think that is wrong.

13083. I so much agree with you. If there were £2,000 coming from somewhere else for agriculture, and we had only got to raise £2,000, we should not be so stupid as to object in that way, but now it is the other way round. If we raise a rate equal to £2,000 somebody else gets the benefit of it ?—Yes.

13084. It is sad to relate, but possibly it is true, that the very well educated man would not return after a college education to agriculture ?—No—as one farmer put it to me once, the more you teach a young boy in the elementary school about agriculture the less chance there is of his sticking to the land. It is a sad thing to say, but it is very often true.

13085. I am very sorry to hear you make that remark, because it is exactly opposite to what I think. I think the rural teaching is now just the very thing to make them stop on the land where they are taught everything relating to agriculture, and if they could go for short walks on the land and go about with their fathers or with the shepherds or with the carters, it would give them an inclination to follow that life ?—I should have thought so. I was not giving that as my opinion ; I was simply quoting what this farmer told me—and he was one of our biggest farmers.

13086. I wonder what he would like them to be taught ?—I think his idea was that agriculture is not much of a line for them, and if you let them drift into agriculture, as their fathers did, if they once get there as boys they will stop there ; but his idea was that if you tell them too much of what they are going into they will not go into it.

13087. With regard to agricultural labourers, do you not think there is a good deal of good in giving prizes at agricultural shows for their labour, such as sheep shearing, hedging, ploughing, and so on ?—Yes. I am tremendously in favour of that ; the minor arts, as we call them in Bedfordshire. We have done a good deal in that direction. I should like to make one remark with regard to ploughing matches. I have heard it stated that ploughing matches afford very suitable opportunities for getting very excellent ploughmen, and that because of that some of the farmers are very shy of sending their men to compete. I do not know whether other people have heard the same thing.

13088. In olden days when the manufacturers took up these ploughing competitions for advertising purposes that was always the case. As soon as farmers saw the champion in the field everybody wanted to have him, but I do not think that is so much the case now ?—I should like to see every county council in the country encouraging hedging and stacking and thatching and those sort of minor arts, because they are getting lost arts in many counties. I think the way the art of hedging, for instance, has been lost in England is very serious.

13089. (By Lord Barnard.) Do you do any draining ?—When we have got any money to drain with, but we have given up draining in the last few dry years.

13090. Speaking personally, I find draining and boring are very essential, and I should include both of those in the instruction ?—We have a great race of drainers in Bedfordshire who still know their work, and I am prepared at any time to send 50 excellent drainers to any part of England and take it piece work.

13091. (By Mr. Latham.) You were speaking of thatching, hedging, and ploughing. Do you not think the very stimulus of offering these prizes induces these men to educate themselves in those things ?—Yes, it is absolutely necessary that there should be prizes ; but on the other hand we were stopped by the auditor in Bedfordshire, because he said we were giving prizes without instruction, so to dodge the auditor a certain amount of instruction is given, but I do not think that instruction is very often sufficient.

13092. That is what I wanted to draw from you : that these labours of agricultural labourers are more easily taught by their own men than any instructor could place before them ?—I should join both. When you have a competition for farriery the blacksmith will listen to a big veterinary surgeon with tremendous interest, and they learn a good deal.

13093. I am very much afraid you must call that scientific teaching ?—Yes, quite so.

13094. The other is the actual sweat of the man's brow, building ricks and that sort of thing. There is no science in that, and there is no science required to hedge ?—With regard to hedging, I should like to get the best man in England to lay a hedge, and then get the other men to look on while he is doing it, even if he never says a word.

13095. We have had it said in this room that if we have outside examiners the teachers should be always sitting by to see how you conduct the examination. That is just the sort of thing that I dislike to see myself, speaking as an examiner ?—That is absolute nonsense, if I may say so.

13096. (By Professor Middleton.) Your idea for agricultural instruction in the county is that each county should have its own instructor ?—Yes.

13097. And that there should be some central institution to which he is attached, such as you have in Bedfordshire ?—Yes, certainly there must be a headquarters. That is most important.

13098. Do you think that the principal of the school or the central institution should act at the same time as a county inspector ?—That is a very difficult point. I would rather he did not if it could possibly be managed, because he has not got time or thought to do it. I think the instructor should be under him.

13099. The county instructor should be under him ?—Yes. The head of the institute must be the head of the thing in the county.

13100. You consider the county work so important that in a county of the size of Bedfordshire you would want a separate instructor really if you had the funds to work the county ?—Yes. My reason for saying that is because I have found if a man has another object his thoughts are off the work that you want him to do.

13101. You think an instructor ought to have been to an agricultural college ?—Yes.

13102. And taken a full course ?—Yes.

13103. You agree that he should be one of the best men at the college ?—Absolutely—he has to know a terrific amount.

13104. Then he has to spend 10 or 15 years in farming, you think, before the farmers will listen to him ?—Yes, gaining a knowledge of farmers and their ways.

13105. He has to gain experience of agriculture not in one district of England alone, but in the whole of England ; he must have general experience, not local experience ?—That is a very difficult point, because general experience might be quite unsuited to the local experience where he finally gets to, and then he has got to begin all over again locally.

13106. I am thinking of the course that the would-be instructor must follow. He has taken his agricultural course at college, he goes as an assistant and has got to be prepared to act as a county instructor somewhere. He does not know what county he may be asked to go to, and it is therefore necessary for him to pay attention to the general practice of agriculture in England ; he must have a wide knowledge of the practice of agriculture ?—Yes.

13107. When you have got the ideal man ready what are you going to pay him in the county ?—I have put in my *précis* that the present salary that is offered enables a County Council only to offer it practically to unsuitable people, and unless a decent salary is offered fit to keep a married man you will never get the right man.

13108. If County Councils have never offered a suitable salary do you not think it is little wonder that the farmer

complains?—I do. I think the whole bottom of the thing is money in that direction. Perfectly miserable salaries are offered to these people which only appeal to an unmarried man, and even then they are not sufficient.

13109. I think that answer you have given very largely explains the first point you have made in your evidence about the dissatisfaction of the farmer?—Yes.

13110. You say they are not satisfied with the present system of agricultural education and that it is extremely difficult to find out the reason. I do not think it is very difficult to find out the reason. If they have not been prepared to pay for the type of man that is required the type of man has not been forthcoming?—That is a thought I had not considered, and I think that is right.

13111. On another point you were very definite in your opinion, and that was that a lad who was intending to become a farmer should not have gone for two years or three years to an agricultural college. You think if he had spent so much time away from home he would not be likely to go back to the land?—To what I may call, without disrespect, a second-class farmhouse.

13112. I think your opinion is quite right so far as the South of England is concerned at the present time, but do you not think that this may be only a temporary phase in our education?—Do you mind telling me does it obtain in the north, because I have such a tremendous respect for people in the north? Education has always come from the north to the south, and if you say that it obtains in the north we may attain to it in the south some day.

13113. I will not say the North of England, but I think if you take the South-west of Scotland you will find a very large number of the young men who are going through agricultural colleges there go back on to the land?—Yes.

13114. Agricultural education in Scotland has not been developed for a much greater time than we have had it in England, has it?—No, but they had John Knox 200 years before we had a similar man!

13115. A short time ago I was in Saxony, and I asked the Professor of Agriculture at the University of Leipzig what classes the students were drawn from, and he said many of them came from quite small farms. I asked him whether many of them went back to the land, and he said many of them do, but of course if some of them get better openings and can occupy themselves in other ways they leave the land?—I think that is all a question of statistics. I think the statistics could be got out as to farmers' sons who go back to their father's farms after they have been away for two or three years to an agricultural college.

13116. I agree with you that it is so in England at present, but I look upon it as a temporary phase, and we may expect to find the same sort of thing in England as has taken place in Saxony and as is taking place in Scotland?—I do not know what the attractions are in Saxony, but a young fellow who has been away and who has widened his mind for two or three years at a college sees other things that he thinks he can make a better living from than by going on to a 300 or 400-acre farm, and I think in a thickly populated place like England even compared with Scotland, there are so many things going on that they are pulling in different directions to prevent a boy going back on to a farm. It is a dull life on a farm.

13117. It need not be?—At any rate the evenings are dull.

13118. The evenings need not necessarily be dull either. I think the explanation of the fact you have brought before us so prominently is this, that whenever you have had a well qualified young agriculturist in this country he can always find something better to do than to go back to the farm, even in agricultural work as an instructor?—I think you want the colleges to supply the teachers.

13119. You expressed the opinion that County Councils should be controlled to some extent in their education work?—Yes.

13120. One could not control County Councils under the laws that exist at present?—No.

13121. One could only influence them, I think, if you were to offer them something?—Yes, that is one way of doing it. I am quite prepared to give the Board of Agriculture similar powers to what is proposed in the Small Holdings Bill for the County Councils.

13122. That is what was in your mind?—On this point, because I can foresee that counties are going to do less and less. I do not like the present system of the Board of Agriculture asking if they may come, and then we have someone who comes down, but he has got no power. He

is always very nice and polite and gives us ideas—I am talking as if I was a member of an Agricultural Committee—but if we like to get up on our hind legs and say we do not want him we need not have him, and I do not think that is the right way to go on. I think he ought to have more power than that because I think he knows more than we do.

13123. You have also expressed the opinion that a Consultative Committee would not be of very great practical use?—I am afraid I have not quite grasped that. There may be reasons which I have not considered, and when I gave my answer I had it in my mind whether a committee was absolutely necessary to give information to the Board's officers before they could work in England, and on that point I did not think it was necessary, but it might be necessary in other ways, as was pointed out by Mr. Latham. If you think it would have any moral effect in getting money out of the Treasury I should go for the appointment of a committee at once, but they would be very clever men if they did I think.

13124. Now with regard to the National Diploma examination you stated that the examination was different from any other examination in England. I think the chief difference that you pointed out was that the examiners met and consulted each other?—Yes.

13125. That is done in most examinations in my experience?—Not in the same degree. I agree you have an examiners' meeting, and in the National Diploma we have a formal examiners' meeting, and after that examiners' meeting the Board, but the spade work—and Lord Moreton will bear me out—in an unofficial way by the examiners sitting next to each other for two or three days constitutes the difference, and I find that makes an enormous difference: these quiet unofficial talks about the candidates which you do not get in any formal meeting of examiners, is very beneficial.

13126. You take the examination papers at Leeds?—Yes.

13127. What happens there?—We have a room, and we all sit down and do our papers. When we have a certain number done the examiners in Geology and Chemistry and so forth get together and discuss them. There are some good men they do not want to talk about at all, and there are some that are too hopeless that they do not want to talk about, but there is a middle lot that they do want to discuss, and they do discuss them. The whole time we are on the look-out for cram. That is what we want to keep down, and I say in those unofficial talks about a candidate if the chemist says; "I think this man shows cram," and the Botany man is of the same opinion, we get suspicious of that man, and we *viva voce* him. I know at Cambridge you have meetings of examiners, but Lord Moreton will bear me out that at formal meetings of examiners nothing much is done to go below what appears on the surface.

13128. How long do you sit like this examining papers?—We are there for three or four days.

13129. How many papers have you got?—Only 49.

13130. I myself do a great deal of examining, and have been doing for 15 or 20 years. I should not at all like to sit and consult with other examiners when I am at my work. I first make up my own mind as to the candidates' work?—So do we, but my co-examiners agree that ours is a very good system.

13131. As a system I should not myself like it. I like to examine independently, and to make up my mind, and then to consult the other examiners?—That is what we do. We do not talk to each other until we have examined the papers first.

13132. I see. You express some surprise that the criticism was that the examination was not practical enough?—Yes, I have heard the criticism made in recent years that the whole trend of it was that it was an examination by practical men who had never taught in their lives, and, secondly, that they did not really know the questions to set; but I should like to add that on all these questions of examination—I do not want to blow my own trumpet—I happen to examine in surveying, and that is a practical subject as to which there can be no argument with regard to whether the papers are practical or not, and in that way, perhaps, I am speaking out a little more freely than some of the other examiners could.

13133. I think what you refer to about the criticism as to the examination not being practical, was not criticism against the examiner, or the practical character of the questions, but that what was in your mind was, that

Mr. H. T.
Eve.

3 July, 1907.

Mr. H. T.
Ecc.
3 July, 1907.

there was no practical examination on the farm?—No, I think it was much more than that. They objected to people setting examinations who had never taught a candidate—who had never taught anyone. Very few of the examiners teach anyone, and they said practically that the only man who could set a practical examination was a man who taught people. That was Professor Wallace's idea in Scotland.

13134. You say the large farmer can look after himself and that we do not need to think of the instruction of his son?—No; I did not say that.

13135. I rather understood you to say that?—That you must provide means for the instruction, but he does not require any push to avail himself of the instruction for his son.

13136. You would rather say he does not want any personal aid?—No, I do not think he does. I think he has brains and money enough to see that his son is properly educated if there are the means to educate him with.

13137. I merely wanted you to make the statement that you must provide the means?—Most essentially. My point was that he does not want this running after like the farmer down the green lane does.

13138. (*By Mr. Medd.*) Have you ever heard of anyone advocating agriculture in elementary schools?—What do you mean by agriculture?

13139. You used the term—you spoke of people advocating agriculture in elementary schools?—I do not remember saying it first of all.

13140. I think you will find that you did, but you can look that up after?—Yes, I remember now, but I was not giving my own opinion. I was stating the opinion of a large farmer.

13141. That large farmer stated that agriculture was a suitable subject for an elementary school?—No, he said the more you teach a boy about agriculture—I ought to have said "about"—the more likely he is to have nothing to do with it in after life. That was his statement.

13142. In my own experience I have never heard the word agriculture mentioned in that respect, but a variety of subjects which deal with animal and insect life, and which are not agriculture in the slightest degree?—I quite agree. I am a great adherent of nature study being taught to boys.

13143. When your boys are finished with these short courses what is it exactly that you advise them to do?—I do not like the expression "finished with the short courses," because I want that boy to be on his father's farm and to take up these short courses every now and then.

13144. To still go with them?—To still continue with them, and to still stop on his father's farm.

13145. What is the type of people whom you desire to go to an agricultural college?—The best farmers' sons—men who have got money, and with regard to whom it is not absolutely necessary whether they come back on to a farm or not.

13146. What type of student do you care for at Ridgmont?—I want the ordinary local farmer's son there, and the instruction will be such as will not prevent him from finally remaining on his father's farm.

13147. You recognise that such schools for agricultural purposes are better than having agricultural sides to a secondary school?—Yes; I do not trust an agricultural side to a secondary school. In the first place I think you will get the wrong people teaching it if you do not mind, and agriculture will be put on one side and the other class of education will be paramount.

13148. You recognise, of course, that it is quite out of the possibility of each county to establish such a school as Ridgmont?—I do not know why.

13149. Because the capital expenditure is too great for one county?—I do not know why other counties should not do what Bedfordshire has done.

13150. Bedfordshire has had very great assistance from the Duke of Bedford?—Yes, but Bedford has had the pluck to vote more money for agricultural instruction per acre than any other county in England.

13151. Yes, that is excellent, but I have no doubt that what the Duke of Bedford has done to stimulate it has encouraged your County Council to do more for agricultural education than has been the case in a great many other counties?—I think that is probably true.

13152. In view of the difficulty there is undoubtedly in starting new schools of new types, do you not think it would

be much better for two or three counties to co-operate and utilise such a school as yours as the school for that area?—Yes. In Bedfordshire we draw £50 a year from two or three counties, and they use the school, and as there is very good train accommodation I think that is an excellent practice.

13153. It is of material advantage to you, and it is also of material advantage to the other counties?—Yes. I may say we practically did that at the suggestion of the Board of Agriculture. That is one instance of a valuable suggestion that we had from them, and that we have carried out.

13154. I am particularly anxious to see all England covered by groups of counties for such a purpose?—I agree.

13155. You are affiliated as a county to the University of Cambridge?—We are.

13156. What direct advantage do you get from that?—I think it is most important we should be affiliated to Cambridge.

13157. As a matter of sentiment, do you mean?—No, much more than that. I was on the Committee, and I believe I seconded that we should be affiliated. I went into the question, and I came to the conclusion that it would be worth it, and I think it is worth it alone to get the services of the—I do not know what you call him, although I know him very well, the man who was in those days Mr. Wood—Professor Wood to come over and direct our experiments. That alone is worth it, and it is very, very useful, and I think we might use our connection much more than we do.

13158. If you apply to a collegiate centre or a university centre for the periodical advice of one of their most competent men your area must undoubtedly benefit?—Yes.

13159. You referred just now to the action of the Board of Agriculture. Do you not think that if the Board of Agriculture had annually schemes of agriculture for the various counties combined within a particular area submitted to it, not for revision, but simply for advice and so forth, it might be of benefit to the particular scheme, and it might stimulate the particular counties a little more?—Yes, that is one way of doing it. Another way of doing it is to have an expert from the Board of Agriculture to just talk it over with the agricultural instructor for the county.

13160. Yes, it might be done in that way, but that does not seem to me to have quite so much effect as you formally, as a local authority, submitting your scheme for mature consideration by the Board, which would be returned to you with their advice and suggestions?—I think I would rather do it the other way, that the county should carry out something, and that then the Board should criticise it the next year. I do not like the idea of any one county sending up a cut and dried scheme which would take some time to prepare.

13161. I think Lord Barnard made an allusion to a consultative committee. It would be one of the functions of that consultative committee in London to discuss the schemes submitted by the various areas, and its more important work would be to take into consideration the views of agriculturists at large, and bring all the required pressure that might be wanted on the Board of Agriculture, and on the Board of Education, in so far as the Board of Education affects agriculture?—Would this consultative committee be composed of practical men or scientific men?

13162. Practical men I should suggest?—I do not think you can dictate to a county. In Bedfordshire, for instance, we might want to have experiments on potatoes, and some committee in London might tell us that we must have it on oats.

13163. You do not want that, but everybody has felt during the past few years that there are many respects in which the Board of Agriculture might be put in possession of larger funds, and might take a more active part in the direction of English agriculture. If a consultative committee were established, composed of men familiar with all the local requirements from Northumberland to Cornwall and so forth, men whose names were familiar with everyone in the county, who drew up and submitted their ideas to the Board, and brought pressure to bear upon the Board, do you not think that that would prove a very valuable body?—I cannot say that I am sweet on it. I would sooner the agricultural instructors of each county met the official of the Board, and that they should talk it over together. Unless the financial point of view enters into it, I do not see that such a committee as you suggest would do any good.

13164. Yes, I should think there would be the money element. As it is at present, the official goes down and

talks it over, and he has no money, and the Committee might have?—I think if the Committee had any moral effect, or financial effect, I should approve of it, but otherwise I do not think I want it.

*13165. (*By Lord Barnard.*) You have not referred in your evidence to what is done in this direction by our colonies and by foreign countries. Do you know anything personally of that?—I only know it second-hand, and I do not think what I could tell you would be of any value therefore.

13166. Should I be right in saying that your object is by means of short courses not to make a man a complete scientific farmer, but so to open and educate his mind that he may continue to improve, and gain his own scientific knowledge and practically apply it?—I should not go quite as far as that: I am not very fond of the scientific farmer only. I find in practice that the real old-fashioned practical man is getting quite as good a living out of his farm as the very scientific gentleman, and I do not want the farmers' sons practically ruined by turning them into scientific farmers. I just want to give them enough scientific knowledge that will help them, and help their fathers in their practice.

13167. Not to make him a scientific man, but to so educate his mind as to make him capable of availing himself of all the advantages that are to be obtained from science as relating to agriculture?—Yes: but I think that ought to be done in his general education: his mind ought to be educated to enable him to take advantage of scientific knowledge. I want him to take cognisance of what is going on, in a semi-scientific way, of things that will help him practically on his farm when he gets back to it: I do not want it to be overdone.

13168. One subject has been mentioned here, that he

should be able to understand analyses?—With regard to that I do not think it necessary that he should be able to understand all analyses, but about a tenth part of what a chemist should know—the practical way of reading an analysis is most important.

13169. You are aware that in Scotland these agricultural colleges receive more assistance from the central Government than any of our institutions do in England?—Yes. I take in a Scotch paper because I like to know what is going on in Scotland, and I am aware of that.

13170. In England you think we compare unfavourably with Scotland in that respect?—Yes: after years of hard work we get £100 given to us, for example, which may be taken away at any moment.

13171. You are of opinion that greater control should be exercised over local bodies. You have considered that that would require legislation?—Yes.

13172. An amendment of the Local Government Act?—Yes.

13173. It is a difficult thing to bring about in the House of Commons, which contains representatives of all classes of the community, not of agriculture alone, and therefore agriculture must make out a very, very strong case for any special favours?—Yes, and that is a thing that the farmers themselves will not do. I am speaking perfectly plainly. Our County Council has a majority of farmers, nearly all of them belonging to the Chamber of Agriculture, and yet they will not do it.

13174. The proximity of London, of course, must affect questions of that kind?—Yes, but I do make a very strong point that if any county is not going to do its duty to the farmers by giving money to provide facilities for the education of the farmers' sons, that there should be some scheme by which they could be made to do it.

*Mr. H. T.
Ecc.*

3 July, 1907.

Major PATRICK GEORGE CRAIGIE, C.B., called and examined.

13175a (*By Lord Barnard.*) The Committee thought with your great knowledge of the history of agricultural education in this country that it would be of considerable value to them if you could give them in your own words, if you please, some information as to the origin in this country of the control and assistance granted by the central Government to agricultural education?—The origin of the movement by the State in favour of agricultural education goes a considerable way back. The Scottish Chair of Agriculture in Edinburgh in 1790 is by far the oldest form of agricultural education that we have known. It was founded not by the State originally, but by private benevolence in that year. Subsequently to that, the Highland and Agricultural Society of Scotland, whose charter included educational work, very largely aided and developed that Chair and applied to the State for assistance, which was granted somewhere about 1868, as far as I can trace it. That was the first instance of State aid, and it was on a very small scale. It was two or three years after I had myself attended the class in Edinburgh, and the matter, therefore, is impressed on my mind as regards the date. But even before the year 1868, or just about the same time—I think Lord Moreton will probably bear me out—the Royal Agricultural Society started their own scheme. So that what I should like to put before the Committee is that a movement for organised agricultural education dates, not from the beginning of agricultural depression, but from the most palmy and successful days of agriculture. I think that is important. With the advance of science it was soon considered desirable to increase the facilities for teaching farmers. In the early papers, which I think Mr. Eve alluded to, as read before the Farmers' Club, the education that was proposed was directly that of the sons of existing farmers. Great dissatisfaction was felt at the absence of good general education in the country districts and the impossibility of farmers' sons being trained in the very imperfect grammar schools of the counties, and of afterwards acquiring scientific knowledge on the basis of their general education. There were papers in 1859 at the Farmers' Club, and again in 1865, and also in 1873, all bearing on that point, that the general education of the farmer's son was necessary before his scientific or technical education began. I served on a committee myself at the Central Chamber of Agriculture in 1873, of

which Sir Michael Hicks Beach, as he was then, was chairman. I was vice-chairman, and we reported on a scheme for improving endowed schools throughout the country, very much on the lines of the scheme that the late Canon Brereton was in favour of.

*Major P. G.
Craigie, C.B.*

13176a That would almost synchronise with the date of the Endowed Schools Act?—Yes. In 1874 the Highland and Agricultural Society again was to the front in this matter, and they approached Her Majesty's Government of that date with a formal memorial setting out their needs. By that time the Science and Art Department at South Kensington had very largely extended the facilities for teaching engineers, manufacturers, and so on, the advantages of science as applied practically to different branches of industry. In particular South Kensington was aiding the training of engineers and manufacturing chemists and various other practical branches, but no attempt was made to apply generally—not only to farmers' sons, but to the smaller people about the country—the practical application of science to agricultural processes. The result of that was that the South Kensington Department started a scheme of instruction that was called "the principles of agriculture." That was the second stage of State aid to agriculture in this country. I have here the reports and discussions that took place on that South Kensington work at the Central Chamber of Agriculture in the years 1876, 1877, 1879, 1880, 1881 and 1882. I can speak from personal knowledge of what was being done at that time, because I was acting for part of the time as an independent member of the Council, and for another part of the time as their secretary, and there were many discussions as to the mode in which the teaching of those principles of agriculture should be administered. The "principles of agriculture" seems to me a singularly inapt term. We approached the Government to get teachers classes instituted, and to get them educated so as to teach more practically, much in the same way as Mr. Eve has pointed out. It was not very successful then. The men who were rural schoolmasters were hardly able to add to their other work, and were not qualified by their early instruction to impart anything like practical instruction in agriculture. The third stage began in the year 1879 with the advent of agricultural depression. The Royal Commission on Agriculture was appointed at that time, the Duke of Richmond's

13176b

Major P. G.
Craigie C.B.

3 July, 1907.

13176c

Commission, and sat from 1879 to 1882. Their Report is before the Committee. It calls attention to the absence of proper facilities for the teaching of farmers' sons, and those intending to practise agriculture. That was immediately followed by a movement, which was also recommended by the Royal Commission on Agriculture, for the formation of a distinct Department of Agriculture, which would have charge of these matters. Such a Department was formed, but at first in 1883 it was merely a Committee of the Privy Council. It was appointed by Mr. Gladstone with the object of meeting the wishes of agriculturists, and that tended to focus the attention of the Treasury upon the agricultural classes and upon the need that existed for money to be devoted to the purpose of the teaching of agriculture. In 1884 the Royal Commission on Technical Education reported, and no doubt the special reports which Mr. Jenkins, the Secretary of the Royal Agricultural Society, made to that Commission made a great impression on the public mind, and pressed for a more practical machinery of teaching than that which the South Kensington classes afforded. A year or two later, in 1887, the Farmers' Club again took up the subject. At that period attention was mainly directed to dairy teaching as distinct from general agricultural instruction. About the same time the question was raised in Parliament very largely by Sir Richard Paget and others, and a Departmental Committee was appointed which sat in 1887 and 1888. That Committee took a good deal of evidence, and no doubt their conclusions are all before this Committee. I was myself on the Continent at that time acting for another Royal Commission on the markets of certain great cities, and I was requested by the Privy Council to furnish them with a formal report on the system of French agricultural schools. That I laid before the Committee of the Privy Council in 1888, and almost simultaneously with that the report of the Paget Departmental Committee came out and came before Parliament.* There the direct recommendation of State assistance was made, and for the formation of district schools, and that a sum beginning at £3,000 a year should be expended by the State for that purpose, rising eventually to £15,000 a year, and that a sum of £3,000 a year should be devoted distinctly to agricultural research. I think I may say that is the origin of State aid to agricultural education. I need hardly tell the Committee that the State did not act on that report to its full extent, but placed a sum of £5,000 on the Estimates to meet the requirements of agricultural education, and the Privy Council immediately proceeded to seek for institutions which were qualified to receive the grants. The Report of the Paget Committee, however, showed that there were almost no such institutions in existence of the type suggested.

13177a

13177b

13177c

13177. Can you tell us what the staff of the Agricultural Committee was that had the control of this education—who were the officials through whom they sought this information?—The Committee of the Privy Council were certain Lords of the Council named in the minute of the Council. The Duke of Rutland was the immediate Minister in charge at that particular time. Sir Charles Peel was Clerk of the Council, and when I went to France for the Council, I took my instructions from Sir Charles Peel and to him I sent my report. There was originally no educational staff at all, although certain inspectors were ultimately appointed and the Secretary of this Committee who was then employed could give you the details of their position. Then in 1888 a Bill was introduced to establish a Board of Agriculture. It did not pass that year. It passed in 1889, and as the result of negotiations which were made by outside bodies, the promotion of agricultural education was distinctly laid down in Section 2 of the Board of Agriculture Act as one of the duties of the State to the country. That was the origin of the present system of grants. I had the honour about this time to receive the Directorship of the Statistical, Intelligence and Educational Department of the Board of Agriculture. At the end of 1889 the work began. The development of those grants has been the subject of many reports that the Committee have had before them, but I should like on that point to say that the chief feature I found and, indeed, what the Paget Committee had found before, was the absence of teaching institutions beyond the South Kensington classes and beyond one or two private colleges, which were quite voluntary in their character, like Cirencester. The first action we took on the Board was to try and foster the setting up of certain large collegiate centres. The Paget Committee had recommended, on the other hand, the creation of one central State school, a normal school for the training of teachers. I think that

very largely arose out of the evidence in my own report in 1887 and 1888 on the methods adopted in France, where the central University of Agriculture is entirely a State body and produces teachers for the schools and trains the departmental professors. That has never been adopted here, but following the system of local development which we developed here, those colleges were set up. The first idea was to establish one in each of the four divisions of England and one in Wales, but as it was found that local assistance and voluntary assistance was required, it was impossible to establish a rigid scheme of laying down a college in a centre of each particular agricultural division, although, as far as possible, the counties were grouped round the centres as nearly as we could, but the individual action of the counties, of course, modified the scheme. The first one that was established was at Bangor in North Wales, and, speaking generally, I think Wales had rather more of the teaching machinery than England, compared to the number of farmers in the country. The Paget Committee laid stress on the importance of not establishing institutions too definitely in advance and in excess of the number of persons likely to require instruction, and I think all through the more recent discussions on education there has been a tendency to neglect the fact that after all the farmers of England and Wales are only 200,000 persons by the Census, and that their sons and other persons who are at any given moment going into farming are not a very great number, and, therefore, we do not require a lot of costly institutions to provide for them so long as we have centres properly equipped with funds for the instruction of those that come to them. That is the origin of the collegiate centres.

13178a

13178b

13178c

13178. Would you now give the Committee your views as to the result of the effect of the Government control over such a system as has been established?—I think those opinions have been very fully expressed in my ten annual reports. These have been presented to Parliament as the Education Reports of the Board of Agriculture between 1890 and 1900, but the fullest statement of what I thought on the matter is contained in the last report I presented, for the year 1900-1. I summed up there the result of the provision made by the State. I ought to have added to what I said just now that coming down to a later period than the formation of the Board, the intervention of Parliament in 1891 provided the counties with a new source of income distinctly applicable to agricultural education in the Residue Grant. That, of course, as the Committee knows, was more an accident than a matter of policy. The money was not intended for that purpose, but when Mr. Goschen's scheme for the Budget of that year failed, it was suggested that this money should be handed over for technical education generally, and as the last witness said, the counties had their own discretion in the matter as to how it should be spent. In the tables appended to the Government report is shown exactly how each county allocates its money. Taking that money which the counties had as well as the money which the Government themselves directly granted, I found at the time of my giving up charge of the Board's educational work that we had something between £85,000 and £90,000 of public money in England and Wales applied more or less directly to agricultural education. The contrast between the time when the Paget Committee reported and the time when I gave up my educational functions resulted in this, that in 1901 there was £28 available for every £1 there was available in 1888, so that there was a large development of machinery and means. The development in the attendance at the different colleges was not so satisfactory, and that could not be expected at the beginning of a new system. I found exactly the same thing in France. The machinery must be set up first. The attendance at the colleges was considerably under the expectations, but the interest in the work was, of course, growing all the time. I see that Dr. Somerville in his report for last year states that by the means of the Government machinery you have 34,000 pupils under instruction at the present time. That certainly is a very large development and it is more or less satisfactory. In different districts there are more or less varying proportions. That includes all the short courses and the long courses; it does not include, of course, the teaching which is conveyed to the adult farmer by means of the experimental plots and visits to farms, which, if I may give my own view, is one of the most beneficial forms of instruction we can give.

13179. Or lectures?—The lecture system has not, I think, been in so much favour as it was originally—the

* Report on French Agricultural Schools. C. 5609 of 1888.

Major P. G.
Craigie, C.B.

3 July, 1907.

peripatetic lectures have not been maintained, and in some counties there have been substituted for them visits of farmers to demonstration plots and so on.

13180. We have been told that lecturing in the counties was necessary at one time in order to stimulate interest, and that now the interest has been stimulated, it is not so necessary as it was. Would you agree with that?—Entirely. I should like to emphasise what I said in this report. At the beginning of this century the State had definitely accepted a liability to assist in the education of farmers, and a large number of counties were equipped with all the machinery and all the teaching staff that was required for every grade of instruction from that in a local village class to a collegiate course of study, and it only wanted the farmers generally to recognise the facilities existing and to make use of them.

13181. (*By Mr. Medd.*) Are those annual records?—Certainly. In those reports of the Board of Agriculture they are all laid before Parliament.

13182. They are accessible to the members of each county?—Certainly. They are sent specially to every county. I think, probably, the Secretary of the Committee, Mr. Brooke-Hunt, could give you detailed evidence as to the actual figures.

13183. (*By Lord Barnard.*) He very probably will do. We thought it was very valuable to get from you information as to facts within your own knowledge?—Yes. There has been a new development, I should add, since the collegiate centres were created by the counties individually developing special schools, or minor colleges in some cases. That is quite a new development and, speaking entirely for myself, and not in any way as an official, I have a little hesitation in seeing considerable sums of money given to the smaller types of institution by the State. I think there is this difficulty, which the Committee will no doubt recognise, that you are placing the Minister in a considerable difficulty when a number of competing claims come before him urged on grounds of local interest. The criticisms that we have sometimes heard in Parliament have been that this or that part of the country has not received quite as much aid as another district. Almost on every estimate, I remember members for Wales putting in claims for more money and urging it on the ground that the Welsh farmers were poorer than the farmers in the rest of the country, and that, therefore, they should have more money from the State purse. On the other hand, the principle adopted by the Board has been to fix a maximum for the different collegiate centres beyond which the State help would not go, and when a fully-equipped college reached that point it received and could reckon upon a certain sum of money. I found the administration of the grant very difficult, because of the new schools that were cropping up in different directions—the possibility of overlapping was pointed out in the Paget Committee—and however useful these institutions are, they may create a tendency now to distract the attention of the central authority from the larger and more scientific colleges where the training of teachers and the highest class of agriculturists is carried on.

13184. Would you be of opinion that it is desirable that the whole system of agricultural education, at any rate where it is aided by public money, should be part of a national system, and not local, except in so far as schools must be somewhere?—I am afraid it is not possible to do that as a matter of practical politics; speaking merely theoretically, I should like it to be done, but I do not think it could be done.

13185. Not entirely?—No.

13186. We will put it the other way, that it would be a great misfortune if—to use the word I have used to other witnesses—each of these counties and districts were to be locked up in watertight compartments and not to care what was going on in the next district?—Yes. I think the county unit recommended by the last witness is not one that *a priori* recommends itself to my judgment. Counties are so unequal that you do not want a college in every county, and the grouping of counties under one centre is a much better system, in my opinion.

13187. Do you think the State is sufficiently liberal in its grants?—I should certainly say, no. I should like to see a considerable addition to the funds at the disposal of the Board of Agriculture, and I think that could be done without unduly increasing the number of separate institutions. I should like to see a larger sum devoted to the direct work of research. I think the £3,000 that was

voted on the recommendation of the Paget Committee should be earmarked for research beyond any educational provision, and I do not think the grants the department have been able to give in the past, or are able to give now, have ever reached anything like that sum for research. Cambridge and other colleges have done a great deal in that direction, and with more State aid towards research we should have a great many advantageous discoveries, not for teaching purposes immediately, but for the discovery of new scientific dogma to be taught hereafter.

13188. You have only mentioned colleges and schools. Do you think that funds from the central Government might be usefully employed in assisting counties in providing the various forms of instruction as to which we have had evidence such as dairy schools, farriery vans, and horticultural lectures, and so on, and even instruction in manual processes?—I think the counties have sufficient funds for these local purposes in the Residue Grant at the present time.

13189. They do not think so themselves?—I think the figures that are shown on page 188 of the last Government Report is conclusive evidence. They had at their disposal a sum of £508,000 in the year 1904–05, and in the year 1905–06, £542,000. Of that they applied to agricultural education between £80,000 and £90,000 and, therefore, I think the sum available is sufficient. What is desirable is that a larger proportion of the county money should be applied to agricultural education, and not so much to the other forms of technical education.

13190. The counties already have to raise rates for the purposes of secondary education, and in that case they would have to raise still more?—The matter is now complicated by the multiplication of technical institutions in the counties.

13191. (*By Mr. Acland.*) You are referring to institutions for the training of teachers?—Yes, and that it was originally suggested might be given in some normal agricultural college.

13192. (*By Lord Barnard.*) I think Mr. Acland was thinking of the training of teachers of a much more greater responsibility than agricultural teachers—the training of national teachers. I think, if I rightly interpret the feeling of the Committee, based very largely upon the evidence which they have had given to them, it is that circumstances have altered so enormously in the past few years that the County Councils, as the local spending authorities, have not got the same money, and are not likely to have the same money at their disposal in the future as they had in the past?—The counties have more responsibility thrown upon them, and there is, therefore, a larger claim upon this fund, but I think the Committee are aware, of course, of the proposals in the Budget for the present year whereby the whole matter will be probably revised, and the provisions for the counties will possibly not take the same shape. All I can say is, so far as the figures before me go the counties have a fairly large sum at their disposal, and certain counties use that very liberally and well. But certain others have done the reverse, and spend almost nothing at all. I should like to see the money more directly earmarked, so that they could not apply the money for technical education, to the relief of the rates alone, or to any other particular purpose. But we must remember the counties are very differently situated in this respect; some counties are very largely non-agricultural, and their other industries are very important, mining and other industries, and you cannot expect the agricultural industry, which is after all a relatively small one, to make its voice loudly heard in the distribution of the money in all cases.

13193. You would prefer that the State money should go principally to these large institutions?—Quite so.

13194. And not to subsidise the smaller forms of institution?—I should like to see the counties endowed with sufficient money for minor local work and for general purposes more than for educational purposes.

13195. I do not know whether your attention has been directed to a suggestion that there should be some sort of advisory council to advise the President of the Board of Agriculture and to focus the experience and views of the various counties so as to enable the central department to have more knowledge on the subject of distributing these grants?—On the parallel of the council established at the Board of Education?

13196. I think so?—I have heard that suggestion on several occasions, but I am not myself very strongly in favour of relieving a Government Department of responsibility by casting its decisions on the shoulders of outside

13192a

Major P. G.
Craigie, C.B.

3 July, 1907.

persons. In the past I think we were very glad to obtain all the assistance and information we could from private persons and county councils and others, but a council meeting to decide the grants would be very apt to degenerate into a squabble between local interests.

13197. There was no suggestion, at least we have not heard of any suggestion, that such a council should decide the allocation of grants at all, but that it should merely bring general experience and knowledge of the very wide area of the whole country down to one particular room and place it at the disposal of the President of the Board of Agriculture?—I think that such a council as that might be of service conceivably in eliciting opinions. It would be a more formal way of getting information than in the past.

13198. (By Mr. Medd.) It would not relieve the Board of any responsibility. It would be merely for placing at the disposal of the Board information from the whole of England collected and tabulated?—Quite so. I think in that form it might be of some value as a channel of information.

13199. And mutual consultation?—Yes.

13200. (By Lord Barnard.) There is another way in which that might be done, that is by increasing the staff?—Yes. I certainly think an increased staff is absolutely necessary.

13201. So that the Board's officers might be more constantly in the different localities in touch with County Councils, and so on?—Yes, in touch with each locality, but that would mean more money.

13202. I suppose the view of those who favour the scheme of an advisory Council is that it would be less costly perhaps?—It may be so, but even if you had an advisory council and any effort is to be made to have a larger amount of work done you must have more staff to inspect and supervise and a higher paid staff.

13203. You might have both?—You might have both.

13204. (By Mr. Medd.) The relationship of the council to the Board of Agriculture would be very similar to that of the County Councils' Association to the Board of Education?—Possibly.

13205. (By Lord Barnard.) You mentioned just now that you happened to be in France and that you gave some report on the French schools?—Yes. This is a copy of the report. I went over in 1887, and again in 1891, to find out the more recent developments: most of the schools I visited were in the east of France and in the north; I did not visit those in the south.

13206. You have mentioned the fact that there is a central institution in France?—Quite so. The French are very logical in their division of machinery and their machinery is, first of all, a National Agricultural University in the shape of a central institution, and then they have three large schools or colleges which are State maintained, and two or three special schools such as the Forestry School at Nancy and the Horticultural School at Versailles. Then they have apprentice schools, *ferme écoles*, *écoles pratiques*, and the *écoles professionnelles*. The apprentice schools are nearly extinct, and the *écoles pratiques* are those that are now principally relied on. There are certain other special schools which of course have been continued, but I think the Committee probably have more recent reports on that.

13207. (By Mr. Medd.) Did you visit the *école primaire supérieure* at Onzain?—No. One of the best types I got was a school near to the German frontier.

13208. What type was that?—Of the *écoles pratiques*.

13209. I only wanted to know if you had met with an *école primaire supérieure*?—Their position was defined in my report there. The *école primaire supérieure* is one of the newer class of schools. They were beginning when I was there, but were not developed then.

13210. (By Lord Barnard.) I should very much like to ask you whether you think any of this systematic scheme which you have alluded to is adaptable to this country?—I think certain features of the French scheme might be adopted here, but we have got now to face the fact that we have set up a system of our own, and it would be very costly to revert to the French system now, and, again, the French farmer is rather a smaller man. A number of the students I found at the *écoles pratiques* were sons of quite small farmers, even a smaller class than the Danes, and therefore the system would be different from ours. Their efforts have been in the direction of teaching almost illiterate peasants' sons the use of modern agricultural

machinery, which was very little known in a great many parts of France. That has had a marked result on the agricultural industry in the east and north of France. So that their system is not absolutely analogous to our own. I discussed it with the head of the Department of Agriculture when I was there, and he pointed out that our agricultural system was on a higher basis, and knowing our system he thought there would, nevertheless, be room for a great development of that system by institutions starting a little above the type of the French schools.

13211. Do you know the type of school at Basing?—Yes. That is very much like the *écoles pratiques*, and I think it forms for the inferior class of school a very good example.

13212. Would you like to see more schools of that description in England?—I should like to see more of them, but I do not say every county should have one. On the recent Small Holdings Committee that school was specially singled out and that type of school was specially recommended.

13213. Are you familiar with the school systems in any other parts of the world?—I was sent in 1893 to inspect the colleges and the experimental stations in the United States. I went over a great number of those colleges and presented another report which is also a Parliamentary Paper,* and which gives a full report on the system as it existed at that date. It is a very elaborate system, and there is a very large sum of money behind it, each of the States having grants reserved and ear-marked for the purpose of agricultural education, besides something like 15,000 dollars in every State for experimental stations from the Federal Government. Some colleges had, in addition, very large endowments given by private persons.

13214. (By Mr. Medd.) They are now in fact trying to cut the expense down, are they not?—Yes.
